# GENERAL INDEX

## Suggestions for Use of Index

With such exceptions as noted below, articles are indexed under the apparatus to which they chiefly refer. This index is essentially a subject index and not an index of titles. A liberal use of cross references is designed to assist in finding articles.

Central-station companies and their general activities are indexed under the state and city in which they are located. Cities and other communities are indexed under the state in which they are located.

Some related articles have been grouped under such headings as follows:

ASSOCIATIONS AND SOCIETIES (major articles and news items relating to associations are listed under names of individual organizations).
BOOK REVIEWS.
COMMERCIAL ACTIVITIES AND PRACTICES (includes articles on merchandising by central-station companies and dealers).
COMMISSION REGULATIONS AND RULINGS (includes articles pertaining to state public service commissions and their ordinances).
COURT DECISIONS (includes articles on legal rulings).
DISTRIBUTION.
FINANCIAL AND CORPORATE MATTERS.
GENERATING STATIONS, STEAM.
GENERATION.
HYDRO-ELECTRIC DEVELOPMENTS AND PLANTS.
MANUFACTRING AND MARKETS (includes articles on business and trade conditions).
MEASUREMENTS AND MEASURING.
NEW EQUIPMENT (new devices brought out by manufacturers are included under this head).
OWNERSHIP (includes customer, government, municipal and public ownership articles).
PUBLIC RELATIONS.
RATES.
RESEARCH.
RURAL ELECTRIC SERVICE (includes articles on farm electrification).
STATISTICS
TESTING.
TRADE AND INDUSTRY RELATIONS.
TRANSMISSION.
UNITED STATES GOVERNMENT (except articles relating to the Federal Power Commission).

Articles indicated by an asterisk are illustrated, while articles followed by the letter "D" appeared in the Digest of Contemporary Electrical Literature.

Following the main index is an index of authors of signed articles, and following that is an index of men whose names have appeared in the section entitled "News About Men of the Industry."

### PAGES BY ISSUES

| | |
|---|---|
| 1 to 82 | January 7 |
| 83 to 132 | January 14 |
| 133 to 184 | January 21 |
| 185 to 234 | January 28 |
| 235 to 286 | February 4 |
| 287 to 336 | February 11 |
| 337 to 388 | February 18 |
| 389 to 438 | February 25 |
| 439 to 490 | March 3 |
| 491 to 540 | March 10 |
| 541 to 592 | March 17 |
| 593 to 642 | March 24 |
| 643 to 692 | March 31 |
| 693 to 744 | April 7 |
| 745 to 794 | April 14 |
| 795 to 846 | April 21 |

| 999 to 1050 | May 19 |
| 1051 to 1130 | May 26 |
| 1131 to 1180 | June 2 |
| 1181 to 1276 | June 9 |
| 1277 to 1326 | June 16 |
| 1327 to 1374 | June 23 |
| 1375 to 1422 | June 30 |

---

### A

Accident prevention:
——Air-tripped steam dumps prevent accidents, *1150.
——Blackwell, H. C., talks on, 528.
——Circuits, signal device promotes safety on, *1384.
——Fire, sawmill, reduced hazard, *251.
——Flexibility of arrangement and operating safety, *351.
——Intelligent analysis vs. expedients to avoid trouble (G. B. McCabe), 148.
——Proper location of disconnecting switches insures safety (W. Specht), *907.
——Safeguarding operators of mercury-vapor turbine units (T. H. Soren), 348.
——Safety grounding, temporary, D, 214.
——"Safety net" plan produces results, 141.
——Safety practices (N. E. Emmons), *294.
——Substations, safety for outdoor, *254.
Accounting:
——Allocation of sales costs, 1230.
——Importance of, 1233.
——N.E.L.A. National Section Report, *1233.
——Progress in standardization, 1234.
Acid, electrical distillation (C. M. Hoff), 1353.
Adsorption:
——Gases by solids of (H. H. Lowry and P. S. Olmstead), D, 570.
——Phenomena in primary cells (E. O. Jegge), D, 1353.
Advertising:
——Central station:
    Apologia is not (editorial comment), 491.
    When will the electrical industry talk to its public (editorial comment), 441.
——Outdoor, electrical, a revenue-builder (editorial comment), 85.
Africa:
——Water power, developed and potential hp., 67.
Agricultural Engineers (see American Society of).
Air, compressed, combats anchor ice, 140.
Alabama Power Co.:
    Budget of $15,000,000, 167.
    Jordan dam plant, *59.
    Linden-Jackson 90-mile line, 373.
    Martin dam transmission, 474.
    Mobile substation, *596, *603.
    Upper Tallassee plant, *373.
Alaska, water power, developed and potential hp., 67, 81.
Alternators:
——Characteristics under conditions approaching instability (John F. H. Douglas and Edward W. Kane), D, 365.
——Sudden short circuit of (Sadatoshi Bekku), D, 111.
American Electrochemical Society:
——Chemical applications of electricity (editorial comment), 899.
American Engineering Council:
——Acts on Boulder dam and other matters, 1115.
——Electrical engineers, and the (editorial comment), 134.
——Officers of, 169.
——Steadfast against federal ownership, 118.
American Engineering Standards Committee:
——Changes procedure, 930.
——Preferred numbers issued by, table of, 484.
——Radio committee elects officers, 527.
American Institute of Electrical Engineers:
——Convention:
    Denver, 1163.
    Winter in New York, 321, 368, 393.
    High lights of program of, 167 (editorial comment), 389.
——Insulation, system, improved (Philip Sporn), (editorial comment), 999.
——Electrification, railroad power contracts and use of utility service (Vandersluis, Withington and Hill) (editorial comment), 1000.
——Voices across the sea (editorial comment), 391.
——Middle Eastern district, Trip to Conowingo, 881.
——Northeastern district, New Haven, 726, 978.
——Regional meeting at Baltimore, 826.
——Regional meeting, New Haven, 726, 881.
——Southwestern division, meeting at St. Louis, 321, 574.
——Summer convention, Denver, 1403.
American Oil Burner Association, Convention, 527, 827.
American Society of Agricultural Engineers:
——Neff and Holloway address, 1407.
American Society of Mechanical Engineers:
——Convention echo, a (editorial comment), 746.
——Research, plan for fuel, tentative, 629.
——Spring meeting at Pittsburgh, 932, 1030.
American Society for Testing Materials convention, Atlantic City, 1407.
American Welding Society, meeting in New York, 931.
Annealing, electric:
——Brass, shows good economics, of, 1349.
——Century Electric Co. anneals lamination sheets, *1301.
Applause cards, do we want? (Frank L. Dame), *1097.
Appliance (see also Commercial activities).
——Business in 1927, 6.
——Consumption small (Harry A. Snow), *146.
——Demonstration, bus used for, *466.
——Domestic, in Brazil (Howard A. Lewis), 1351.
——Electric Light & Power Company of Abington & Rockland, Mass.:
    "D. R." plan sells many, 719.
——Employee use of, 306.
——Georgia Power Co.:
    Value of campaigns established, 972.
——Heavy-duty, beckon (editorial comment), 1279.
——Load values:
    Utility research indicates (Harry A. Snow), *143 (editorial comment), 135.
——Merchandise sales for 1926-1927 and, 77.
——Merchants' Association formed to sell (G. A. Keunler), 1150.
——Northwestern Electric Co., display room, *211.
——Repairs, profitable utility service, 459.
——"Representative plan." Stone & Webster district (Norman T. Wilcox), 110.
——Servicing an obligation—but whose responsibility? (editorial comment), 493.
——Union Electric Light & Power Co. (Mo.):
    Cost of using electric, *312.
——Use table answers cost queries (Willard Allphin), 1399.
Arizona:
——Utilities Association, Convention, 982.
Arkansas:
——Power & Light Co.:
    Couch dam, 72.
——Southwestern Gas & Electric Co.:
    Little River, near Horatio plant, 577.
——Utilities Association:
    Convention at Hot Springs, 1029.
    Elects new officers, 1114.
Armature:
——Direct-current, heat losses in the conductors of a (W. V. Lyon, E. Wayne and M. L. Henderson), 398.
Artistic Lighting Equipment Association Convent'on at Cleveland, Jan. 25 to 28, 268, 1306.
——Convention at Chicago, 1118.
Congressional investigation of utilities, power (see Investigation).
Ash, disposal, fuel handling and (J. R. McCausland), D, 1401.
Asia, waterpower, developed and potential hp., 67.

*Indicates illustrated articles

Associations and Societies (see also names of individual organizations):
——Directory of, 80.
Association of Electragists International convention at Chicago, 1310.
Association Island:
Camp co-operation VIII meeting, 1408.
——League conferences, midwinter meeting (editorial comment), 187.
Atmosphere:
——Experiments and observations concerning the ionized regions of the (R. A. Heising), D, 722.
Atom:
——Matter and senses (C. L. Kasson), 1110 (editorial comment), 848.
——What is in the (editorial comment), 848.
Atomic emissions, astral analysis by (editorial comment), 950.
Attwill replies to critics, 479, 509, 530.
Australia:
——Bunneroug electric power station (Electrical Engineer, Australia), D, 314.
Austria:
——Energy generated in 1925, *34.
——Spullersee hydro plant (A. Hruschka), D, 314.
Automobile:
——Enameling, electric, used in Packard plant (R. J. Gaudy), *1289.
Aviation:
——Neon lights for, use, 131.
——Southern Colorado Power Co.:
Power plant stack to guide aviators, 1409.
——Transmission lines:
Landing, collision with (editorial comment), 186.
Awards:
——Edison medal upon Dr. William David Coolidge, *402 (editorial comment), 390.
——Howard medal to James H. McGraw, *421 (editorial comment), 391.
——John Fritz medal upon General John Joseph Carty, *402 (editorial comment), 390.
——N.E.L.A. Convention, 1244.

## B

Baking, electric:
——Economical, of food products proves, 769.
Barometer, *Electrical World* (see Industrial activity under Statistics).
Batteries:
——Drying and storage of secondary battery plates in the charged state (Sakee Makio), D, 1304.
——Electric storage (E. C. McKinnon), D, 418.
——Storage:
In relation to modern supply of electric lighting and power (E. C. McKinnon), D, 1402.
Battery:
——Control, simplified, of, group, *301.
Belgium:
——Energy generated 1925, *34.
——55 per cent of homes served electrically, 350.
Blueprint ethics ("Manufacturer"), 364.
Boiler:
——Auxiliaries, control of (W. S. Martyn), *713.
——Electric, uses hydro surplus, *1151.
——Hartford Electric Light Co.:
Tubes, shooting slag off, 802.
——High-pressure, innovation in (editorial comment), 288.
——House control, electrical equipment for, D, 366.
——Plant equipment costs, 104.
——Steam, high-pressure (G. A. Orrok), D, 1401.
——Water, feed treatment in the Southwest, 1340.
Boltzmann-Hopkinson principle of superposition (F. D. Murnaghan), D, 214.
Book reviews:
——American universities and colleges (David Allan Robertson), 1028.
——Anleitung zur entwicklung elektrischer starkstrom-schaltungen (Dr.-Ing. Georg I. Meyer), 520.
——Archiv für elektrotechnik (W. Rogowski), 1028.
——Berechnung von drehstrom-kraftubertragungen (O. Burger), 1028.
——Berliner, Emile, Maker of the microphone (F. W. Wile), 1028.
————Blue book (electrical trades directory and handbook, 1928) (electrician), 1028.
——Central station voltages (Lamp committee, N.E.L.A.), 774.
——Electric traction on Italian railways (minister of railways and communication), 1354.
——"Electrician" annual tables of electricity undertakings, 1928 (The Electrician), 1354.
——Electricity on the farm and in rural communities (C.R.E.A. bulletin Vol. 4, No. 1), 617.
——Electricity, the story of (Herman Goodman), 1354.
——Electro-farming (R. Borlase Mathews), 774.
——Elektrischen einrichtungen für den eigenbedarf grosses kraftwerke die (Friedrich Litze), 520.
——Elektrische vollbahnlokomotiven (Dr. Karl Sachs), 1354.
——Elektrowarmeverwertung (Ing. Robert Kratochwil), 774.
——Elements of machine design (Prof. J. D. Hoffman and Prof. L. A. Scipio), 1354.
——Engineering practice, electrical (J. W. Meares and R. E. Neale), 774.
Book reviews (Continued):
——Engineering, an introductory text book of electrical engineering (John Robert Benton), 774.
——Engineering students, laboratory notes for electrical (A. R. Nissar), 774.
——English for engineers (S. A. Harbarger), 520.
——Eleichstrommachine die (Dr.-Ing. e.h. J. L. La Cour), 520.
——Grundlagen der hochfrequenztechnik die (Dr.-Ing. F. Ollendorff), 520.
——Grundlagen der wechselstromtheorie (P. B. Arthur Linker), 774.
——Heating, electric (Edgar A. Wilcox), 1354.
——Hilfsbuch für die elektrotechniok (Karl Strecker), 1028.
——Hochfrequenzmesstechnik (Dr.-Ing. August Hund), 1354.
——Hochspannungs freileitungen (Dr.-Ing. K. Draeger), 520.
——Industrial progress, a century of (edited by Frederic William Wile), 774.
——Intermediate electricity and magnetism (R. A. Houston), 1354.
——Isolierte leitungen und kabel (Richard Apt), 1028.
——Les moteurs à courants alternatifs (L. Lagron), 316.
——Matter, electricity, energy (Walter Gerlach and Francis J. Fuchs), 774.
——Mechanical world electrical pocket book Manchester, England), 316.
——Messwandler, die (I. Goldstein), 774, 1354.
——Motor, A. C. Commutator (C. W. Olliver), 774.
——Motor practice, induction (A. M. Dudley), 1028.
——National electrical safety code (Dept. of Commerce), 1028.
——Physikalischen grundlagen der elektrischen festigkeitslehre, die (N. Semenoff and A. Walther), 1354.
——Public Utilities, the story of (Edward Hungerford), 774, 1354.
——Radio engineering principles (H. Lauer and H. L. Brown), 520.
——Regelung und Ausgleich in dampfanlagen (Th. Stein), 316.
——Scientific purchasing (Edward T. Gushee and L. F. Boffey), 1354.
——Selbsttaig signalanlage der Berliner hoch-und-undergrundbahn (Alfred Bothe), 1354.
——Storage batteries (Moton Arendt), 1354.
——Storage batteries simplified (Victor W. Page), 1354.
——Theorie der wechselstromübertragung (Dr. Hans Grunholz), 316.
——Trade Association activities (Irving S. Paull, I. M. Willard and James S. Taylor), 316.
——Transformator in betrieb, der (Dr. Nulan Vidmar), 520.
——Transmission, electric power, principles of design and performance (E. A. Loew), 316.
——Transmission engineering, overhead electric power (William T. Taylor), 316.
——Transmission line engineering (W. W. Lewis), 774, 1028.
——Turbines, steam (E. F. Church, Jr.), 316.
——Turbo-generator plant, materials and design in (O. Lasche and Walter Kieser), 774.
——Weights and vestiges of pre-metric measures persisting in metric system in Europe, 1926-1927 (Arthur E. Kennelly), 1028.
——Winders, electric (H. H. Broughton), 774.
——Winssenschaftliche abhandlunger der Physikalisch technischer reichsanstalt, 1354.
——Wissenschaftliche abhandlungen der Physikalisch-technischen reichsanstalt, 520.
——Zandeselektrizitätswerke (S. Shönberg and E. Glunk), 520.
Borings:
——Reclaimed at $20 per ton with electricity, 262.
Boston Edison (see Edison Electric Illuminating Co. of Boston under Massachusetts).
Boulder Canyon dam (see hydro and Philadelphia Electric Co.)
Brass:
——Annealing, electric, of, shows good economics, 1349.
——Test for, physical properties and methods of (H. N. Van Deusen, L. I. Shaw and C. H. Davis), D, 214.
Brazil (see South America).
Brooders, electric:
——Revenue, bring good (J. C. Scott), *206.
Brushes:
——Carbon, simplification of (E. A. Williford), 668.
——Replacements, size important in (M. E. Reagan), 758.
Budgets (see under Financial and Corporate)
Burners:
——Oil, utility attitude on, 1348.
Bus:
——Simplified design at Siegfried, Pa., *862.
——Structure tests, concrete (Willard A. Kates), *1379.
Support, Hollow-square, 385.
——Supports, indoor, 282.
Buses:
——Brooklyn Edison Co.:
Exposed, eliminated in outdoor substation, *512.
——Chicago, outdoor compartments at, *62.
Bushings:
——Condenser, design of (Electrical Review, England), D, 264.
Business:
——Allocation at Cambridge, Mass., 821.
Business (Continued):
——Central station:
Engineering brains needed for building (editorial comment), 1053.
——Development, new—Kansas City Power & Light Co. (B. J. George), *207.
——Outlook for electrical men (editorial comment), 3.
——In 1927, 5, 6; profitless prosperity (editorial comment), 2.
Business news and market conditions, 76, 128.
——Apparatus, imports of electrical, into United States by commodity and by Country of origin for 1927, 381.
——Buyer and seller—a partnership (Edward L. Johnson), 1154.
——Code to recognize "thin wall conduit," 433.
——Distributing goods through a bonded warehouse (Charles L. Eidlitz), 211.
——Electrical goods, orders for, 1922-1927, 331.
——Executive views on, 12 to 15.
——Market conditions, 78, 128, 178, 230, 279, 332, 382, 435, 484, 536, 586, 638, 688, 738, 790, 840, 892, 942, 994, 1044, 1127, 1174, 1272, 1320, 1370, 1418.
——Metal market prices, 78, 128, 178, 230, 279, 333, 435, 484, 536, 586, 638, 688, 738, 790, 840, 892, 942, 994, 1044, 1127, 1174, 1275, 1320, 1370, 1418.
——Refrigerator standardization, conference on, 381.
——Trucks in industry, application of industrial, 434.
——Vacuum-cleaner sales, 1173.
——Washing machine sales, *536.

## C

Cable:
——Arc-proofing (C. H. Shaw), 1338.
——Arcing tests on (D. I. Fuchs-Kaufmann), D, 467.
——Bundling reel lagging (N. E. Buck), *765.
——Drums, super-tension, D, 162.
——Duquesue Light Co., Pittsburgh:
Submarine, approach tunnel (M. R. Sumner), *966.
——Edison Electric Illuminating Co., bridge for locating faults (Charles H. Smith), *957.
——European conditions, notes on (Philip Torchio), 972.
——Faults, locating underground network, *1344.
——Failures, blame for (editorial comment), 694.
——Handling:
Detroit Edison Co. (G. B. McCabe), 148.
——High-tension:
paper-insulated, influence of internal vacua and ionization on the life of (Alexander Smouroff and Leo Mashkileison), D, 315.
——High-voltage:
Insulating oils for (T. N. Riley and T. R. Scott), D, 721.
Loaded (A. F. Puchstein), *697.
——High-voltage problems (T. N. Riley), *137 (editorial comment), 746.
——High-voltage:
Transmission by (Dr. Richard Apt), 1018.
——Impregnation, control of (P.. Junius), D, 418.
——Layout aids splicers (T. W. Swartz), *252.
——Laying improvements (E. S. Byng), D, 1352.
——Lead, sheathing by cracking and its prevention the deterioration of (S. Becknisale and H. Watersouse), D, 722.
——Life, influence of internal vacua and ionization on (Alexander Smouroff and Leo Mashkileison), *395.
——Loads from looped or trapped high-tension feeders (H. L. Wallau), *757.
——Long sections reduce expense (C. H. Shaw), 599.
——New York Edison-United Companies:
High-tension test set for 132-kv., *352.
——132,000-volt, single-conductor, lead-covered (P. Torchio), D, 263.
——Pothead protection, *552.
——Pulled by reel on derrick-truck:
Northwestern Electric Co., *906.
——Racked on iron-pipe supports (T. W. Swart), *700.
——Racking, floor trenches aid in (T. W. Swartz), *756.
——Risers concealed in overhead-underground structure (Los Angeles Bureau of Power & Light), (C. H. Jenkins), *1378, *1383.
——Sheath troubles at duct edges (C. H. Shaw), 706.
——Sheath troubles, porcelain duct entrances reduce (William E. Beauregard and O. G. Brush), *102.
——Slack-pulling device protects sections (N. E. Buck), *653.
——Splicing, proper cutting of lead sheath improves (John A. McHugh), *1017.
——Surface trenches, in:
American and European practices (editorial comment), 796.
——Testing, 33,000-volt (M. Hochstadter and E. Bowden), D, 214.
——Transmission, for high-voltage (editorial comment), 543.
——Underground:
England's proposed interconnected network, for, 119.
——Void formation in (W. N. Eddy), *701.

*Indicates illustrated articles

Calculating table, securing accurating results with, *1351.
California:
——American River Water & Power Co., American River project, 218.
——Commercial era, enters (A. F. Hockenbeamer), *1087.
——Commission exercises rigid supervision, 173.
——Developed waterpower, 1921-1927, *35.
——Edison Co.:
  Long Beach plant nears completion, *1280.
——Floods in Sacramento Valley do no serious harm, 675.
——Great Northern Power Co. and Seattle Skagit system may be interconnected, 170.
——Great Western Power Co.:
  Feather River (north fork of) project, 218.
  San Francisco, to build 35,000-kw. plant at, 266.
  To purchase Feather River Power Co., 676.
——Light and power companies cut rates, 165.
——Los Angeles, city of:
  Experts say inadequate foundation caused failure, 727 (editorial comment), 693.
  San Francisquito dam spreads destruction, failure of, *571, *624, *646 (editorial comment), 593, 674.
——Los Angeles Gas & Electric Corp.:
  Lighting, street, wants ornamental, 425.
  Rates to be investigated by commission, 476.
  Rates, to cut again, 273.
  Seal Beach plant, adding 35,000-kw. unit at, 266.
——Oakland's "white way," 600 lumens per foot used on, *103.
——Ontario Power Co.:
  Southern California Edison Co. to acquire stock of, 127.
——Oregon-California Hydro-Electric Co.:
  Projects on Zigzag, Salmon & Sandy Rivers, 218.
——Oregon Power Co.:
  Copco No. 2 and Pacific Gas & Electric Co. Prospect No. 2 interconnection, 1358.
——Pacific Gas & Electric Co.:
  Buget, 474.
  Feather River, Middle & South Forks project, 165.
  Hetch Hetchy still fights to buy distribution plants of, 220.
  Mokelumne River project, 929.
  Pacific Coast observations (P. M. Downing), 396, 408.
  Rate reduction, 426, 469.
——Riverside municipal plant lowers rates, 72.
——San Diego Consolidated Gas & Electric Co.:
  Construction program, plans record, 330.
——San Francisco, city of:
  Valuation figures miles apart, 1403.
  Votes bonds for water supply, 984.
——Sierra & San Francisco Power Co., South Fork of Stanislaus River project, 218.
——Southern California Edison Co.:
  Big Creek No. 1:
    Gaging of mountain in snowfall enable forecast of hydro-electric supply, *290.
  Budget, 829.
  Ontario Power Co., stock to acquire 127.
  San Joaquin, acquires riparian land along the, 118.
——Southern Sierras Power Co.:
  San Bernardino-Seal Beach line, 578.
  Snow Creek project, 218.
Camp Co-operation VIII at Association Island, 1408.
Canada:
——Abitibi-Spanish River and associated newsprint companies own 500,000 potential hydro horsepower, 323.
——Alcoa Power Co.
  Chute à Caron on Saguenay River, 322.
——Beauharnois Light, Heat & Power Co.:
  Lake St. Francis and Lake St. Louis plant, 523, 986.
——British Columbia Electric Railway Co.:
  Alouette plant, *424.
  Reduces rates, 122.
——Calgary Power Co.:
  Gets Bow River site, 1035.
  Natural gas may be fuel for, 576.
——Central station power, *453.
——Customers by provinces, in 1924-1925, 452.
——Customers in, 1924 and 1925, 109.
——Duke-Price Power Co.:
  Saguenay River plant, 322.
——Energy generated 1925, *34.
——Gatineau Power Co.:
  Ile de Maligne plant, 322.
——Gatineau power to cost Kingston, Ontario, $8 a horsepower more than regular supply, 168.
  River, development of, D. 1352.
——Great Lakes and Atlantic Canal & Power Co., 880.
——Hydro-Electric Power Commission of Ontario:

——Municipalities should not operate utilities at loss to taxpayers (Iowa), 832.

Court Decisions (Continued):
——Negligence:
    Borough which allowed wire in part part to sag within reach of children (Pennsylvania), 1410.
    Casually placing hand on electrical apparatus exposed on street not contributory (Texas), 374.
    Contributory of children a question for jury (California), 1166.
    Contributory, of workman splicing charged wires without gloves held for jury (New Jersey), 578.
    Evidence to show, on two counts, not withstanding admission of one of them by defendant, need not invalidate trial (California), 1036.
    Instruction in damage suit requiring plaintiff to prove absence of contributory, held error (West Virginia), 680.
    Right and wrong charges to jury on, of company (Alabama), 528.
    Theory that loss from fire was due to electric company's, found speculative (New Jersey), 730.
    To recover for personal injuries on specific allegations of, there must be proof of (Iowa), 884.
    When is contributory, a matter of law (Iowa), 884.
    Where adequate switches are provided, cannot be predicted on absence of particular kind (Maryland), 1362.
    Where there is failure to prove contributory, errors in instruction on such, are without prejudice (California), 374.
    Willful failure "to observe safety rules means more than (Tennessee), 374.
——New Jersey commission's division of territory upheld, 374.
——New York water power act is sustained, 1159.
——No cause of action shown where child was killed by climbing on taut and accidentally touching wire (Georgia), 325.
——North Dakota, entry of occupied field permitted in (North Dakota), 273.
——Novel case of mixed federal and state jurisdiction (Pennsylvania), 934.
——Operators of motor-driven machines to be licensed as steam engineers found void, ordinance requiring (New York), 427.
——Oral permission of husband for erection of poles on wife's property accepted at company's risk (North Carolina), 476.
——Oregon County Court claims regulatory power over lines built under blanket franchise, 934.
——Patent pools and anti-trust laws (David L. Podell and Benjamin S. Kirsh), 919.
——Poles, wires, conduits and lamps not assessable as real estate (District of Columbia), 832.
——Police power of state upheld in Oklahoma, 680.
——Power company rights in national forests (South Carolina), 934.
——Power of Commission to amend its records (Ohio), 1362.
——Power of commission to tax water-power production under guise of rental denied, 730.
——Private company barred from supplying alternating-current energy in city with municipal direct-current supply (Iowa), 273.
——Public interest, in the, "means not detrimental to the public" (Maryland), 528.
——Radio, De Forest patents again sustained (Delaware), 122.
——Railroad found liable to power company for bridge constructed by latter (North Carolina), 630.
——Rate base, Ohio court approves ruling out of "going concern" value as an item in.
——Rate making, function of Kansas courts in, 832.
——Rates, to show that those set by commission are unjust, burden rests on those seeking special (Oklahoma), 222.
——Right to cross power line with aërial upheld (New York), 934.
——Right to recover for injury from electric company furnishing emergency service only (Texas), 578.
——Tax, supreme court finds special for recording long-term mortgages unconstitutional (Kentucky), 1120.
——Tax paid by holder of light and power franchise, proper division between county and city of (California), 578.
——Telephone company wins important wiring case (Massachusetts), 170.
——Telegraph, inductive interference by power companies' lines with machine transmission of messages by (California), 222.
——Tennessee Tax illegal, 673.
——Transmission line, height of, applied to existing as well as future lines, order of commission governing (California), 427.
——Utility confined by state commission to certain part of divided territory not deprived of property without due process of law (New Jersey), 630.
——Utility serving patrons at summer resort, duties of (Michigan).
——Utility to pay attorney fees as condition of dismissal of "adquod damnum" proceedings an error, court order to (Nebraska), 325.

Court Decisions (Continued):
——Valuation, commission decision on, presumably correct (Massachusetts), 1313.
——Vested rights, privileges and franchises cannot be impaired by ordinance (New Jersey), 1410.
——Water power rights permit increased use in public interest (Oregon), 1036.
Crane, electric:
——Fifteen-ton electro-hydraulic ingot casting, D, 671.
——Magnets aid metal handling, *93.
——Material-handling, saves time and labor, *205.
Currents:
——High-frequency (E. W. Marchant), D, 111.
Customer Ownership (see also under Financial and Statistics).
——Bankers favor plan:
    (Herny R. Hayes), 969.
——Costs (A. G. Neal), 968.
    Saving in financing, 968.
——Creating a permanent money market (editorial comment), 745.
——Customer ownership, 1232.
——On increase (B. G. Gossler), *1098.
——Standard Gas & Electric Co.
    Sales total $32,000,000, 225.
Customers—(see also Financial and Statistics):
——Canada, 1924 and 1925 in, 109.
    By provinces, in, 1924-1925, 452.
——Central station:
    In 1907-1927, 6.
    Division of, 1907-1927, *38.
    Complaints, revised handling of (J W. Williams), 970.
——Consumption:
    "One more kilowatt-hour per home per day" campaign, 216.
    Per domestic, 77.
——Costs, determining, 261.
——Deposits, refunding (J. W. Williams) 1301.
——Domestic:
    Price or cost? (John F. Duffy), 771.
    Time has come to spotlight the output (editorial comment), 289.
——Energy sales per residential, *183.
——Load and revenue (e. c.) 135.
——Residential, use 753 kw.-hr. per year (D. F. McCurrach), *869.
——Revenue:
    Inducement rates and (editorial comment), 1053.
    Per meter increased by merchandising, 1394.
    Values compared (E. H. Jenness), *460.
——Sales overdone, are (H. M. Cameron), 967.
——Served by Central stations:
    In 1927 (G. F. Wittig), 17.
——Service representative plan, women workers used in (W. G. Burrill), 567.
——Two homes out of three electrified, by geographic section, *489.
Cyclograph, an electromagnetic (Takeo Akahira), D, 366.

Output of hydro and fuel power plants, 1925-1927, Table IV, 18, *21.
Output, revenue and expense of industry by sections, 1922-1927, Table III, 18, *19, *22.
Output 3,020 kw.-hr. per kilowatt in 1927, average, 1171.
Peak load of 100,000,000-kw.-hr. systems in 1927, supplement to May 5, Table I, 914.

*Indicates illustrated articles

Statistics (Continued):
——Central station (continued):
Per cent coal used per kilowatt-hour, 1919-1927, *19.
Per cent of total population living in electric lighted dwellings, 1912-1928, 32.
Plants sold in 1927, 45.
Poland, energy generated 1925, *34.
Power in American industry, 1899-1925, *34.
Revenue, 5, 6, 32, *33, *37, *39, 285, 1365.
——November operations, *225, December, 1927, 429, January, *683, February, *937, March, *1169, April, 1365.
Revenue for the chief branches of electrical industry, 1927, *33.
Revenue per dollar capital, 1913-1927, *39, 285.
Revenue per kva. capacity, 1913-1927, *39, 285.
Revenue regional changes in, 1365.
Rumania, energy generated 1925, *34.
Russia, energy generated 1925, *34.
Sales direct to customers 1920-1928, 32.
Sales of securities by investment houses 1920-1928, 32.
Show steady growth and prosperity, 1913-1929, *37.
Sources of gross income, 1921-1927, Table II, 18, *19.
Summary of operations, 1912-1927, 6, 32, *33.
Sweden, energy generated, 1925, *34.
Switzerland, energy generated 1925, *34.
Systems in 1927, 6.
Tax collector, the assistant, *845
Taxes about 9.6 per cent of revenue, 1296.
Total energy generated and imported, Table I, 18, 32.
Total number of:
Commercial establishments, 1912-1928, 32.
Commercial lighting customers, 1912-1928, 32.
Commercial plants, 1912-1927-1922, 32.
Customers, 1912-1928, 32.
Domestic lighting customers, 1912-1928, 32.
Electric light and power establishments, 1912-1928, 32.
Employees, 1912-1928, 32.
Generating plants, 1912-1927, 32.
Industrial power customers, 1912-1928, 32.
Municipal plants, 1912-1917-1927, 32.
Municipal establishments, 1912-1928, 32.
Transformers, 5,000,000 kva. in large, annually, 660.
Trend toward 115 volts, *743.
Value of plant and equipment, 32, *37.
World's electrical energy, 1925, *34.
——Co-operation of utilities appreciated, contents page, Feb. 4.
——Reprints available, contents page, June 16.
——Customers:
Benefit by change from municipal to purchased power, *309.
Canada, by provinces in 1924-1925, 452.
Energy consumption per domestic, 77.
Stock sales to:
November 1927, 278.
December 1927, 74, 429, 531.
January, 991.
February, 991.
March, 1272.
April, 1416.
——Distribution of bond investments of 25 largest life insurance companies 1921-1926, *36.
——East Central survey (T. P. Kindig), 1063.
Added generating capacity, 1066.
Customers by states, 1921 to 1927, 1065.
Generated kw.-hr. by states, 1926 and 1927, 1065.
Output by states 1926 and 1927, 1065.
——Electrical manufacturing:
Additions, 1927, *33.
Capital invested 1927, *33.
Revenue, 1927, *33.
——Electric Railways:
Additions, 1927, *33.
Capital invested, 1927, *33.
Revenue, 1927, *33.
——Europe, electrical industry in, 1125.
——Fuel, continued improvements in utilization of, 534.
——Germany, electric industry, 734.
——Great Britain, energy consumption in five years, 74.
——Gross revenue by classes of business, 1922-1928, *37
—— Hartford Electric Light Co.:
Residential business analysis, 1039.
——Holding companies, number of, 1922-1927, *39, 285.
——Industrial activity and production:
Middle Atlantic States, *184, *744, *1326.
New England States, *388, *948.
North Central States, *490, *1050.
Southern States, 82, *592, *1180.
South's growth, *947.
United States, *380, *434, *584, *687, *788, *892, *992, *1128, *1318, *1417.
Western States, *286, *846.
Where is industrial power market, *1179

Statistics (Continued):
——Industrial:
1927 general production 2 per cent over 1926, *176.
Dollars added by manufacturer per wage earner, 1914-1925, *40.
Dollars of product per wage earner, 1914-1925, *40.
Hp. per wage earner, 1914-1925, *40.
Power in American, 1914-1925, *40.
Significant unit values in, 1914-1925, *40.
Wages per hp., 1914-1925, *40.
——Industry:
Trend of electrical and general, compared, 1398.
——Iowa's claim to leadership in electrical saturation, 475.
——Kentucky survey of industries attracts attention, 787.
——Mexico, energy output in, 636.
——Nations of the world, hydraulic power, 1125.
——Nation's (U. S. A.) water power, *1049.
——Need interpretation (editorial comment), 2.
——New England companies:
Industrial development by, 531.
——New England Power Association:
Growth of companies comprising, *835.
——New Zealand, electric supply in, 938.
——North Carolina:
Developments in 1928.
Water power in, undeveloped, 532.
——North Central survey:
Customers, 1102.
Generator rating, 1101.
Output, 1101.
Population, 1101.
——Northwest (Pacific) survey:
Composite system data for eight major power systems (Guy W. Talbot), 1059.
Consumption, residential, of eight companies for 1927 (Guy W. Talbot) 1058, (editorial comment), 1053
Customers, of eight companies for 1927 (Guy W. Talbot), 1058, (editorial comment), 1053.
Range data, of eight companies for 1927 (Guy W. Talbot), 1058, (editorial comment), 1053.
——Northwestern Electric Co.:
Customers, residential, use 753 kw.-hr. per year (D. F. McCurrach), *869
——Norway:
Claims 2,400 kw.-hr. per capita (Trygve Hodne), 34, 720.
Water power:
Growth and use of (George Smedal, Jr.), *1335.
Westcoast capable of giving 30,000 hp. or more (George Smedal, Jr.), *1335.
——Oil fields, electric power in, 938.
——Oregon great power state, 1272.
——Output, record monthly and yearly energy, 530.
——Pacific coast survey:
California power companies, system data for six, 1922-1927, 1088.
Customers, 1088.
——Pennsylvania utilities (W. D. B. Ainey), 307.
——Quarter billion horsepower utilized in United States, 1040.
——Residential water heating:
Energy used by five customers, *344.
——Roumania, electricity supply in, 75.
——Russia, economic, 787.
——Southern California Edison Co.:
Data book aids operating staff, property, *194.
——Southern survey:
Alabama Power Co. grows rapidly, 1082.
Sales, 1082.
Customers, 1924 to 1927, 1078.
growth of, 1084.
Carolina utilities, growth of typical, 1081.
Georgia utilities, growth of, 1082.
Customers, 1924 to 1927, 1078.
Economic progress, 1910 and 1926, 1079.
Energy generated, 1924 to 1927, 1078.
Tennessee Electric Power Co., growth of, 1084.
——Southwest survey:
Generator rating, 1108.
Population, 1108.
——Steam-electric station:
Geological survey (editorial comment), 439.
——Switzerland:
Output in, large, 815.
——Telephone:
Additions, 1927, *33.
Capital invested 1927, *33.
Developments in 1927, *25.
Distribution of stockholders by size of holdings, *26.
Distribution of the world's telephones, *27.
Growth in 1927, 26.
Revenue, 1927, *33.
Stockholders, 1900-1927, *30.
Wire mileage, 1912-1927, *30.
——Telephones in United States:
1900-1927, *31.
1926 and 1927, 31.
——Water power:
Developed and potential in North America, 67.
In the Ozarks, projected, *929.
——Water power, worlds 1926, the, 81.

——Transmission theory, certain topics of (H. B. Nyquist), 399.
Telephone (see also Financial and Bell System, and Telephone, under Statistics).
——And telegraph conductors, electric currents in (J. A. Fleming), 113.
——Cable sheath alloys, fatigue studies of (John R. Townsend), D, 672.
——Carrier-current performance (editorial comment), 848.
——Circuit, New York-London (S. B. Wright and H. C. Silent), D, 468.
——Developments in 1927, *25.
——European condition; notes on (Philip Torchio), 972.
——Grid current modulation (Eugene Peterson and Clyde R. Keith), D, 570.
——Industry, scholarship brings dividends (editorial comment), 898.
——In United States, 6.
——"Inverted speech" demonstrated, 522.
——New York-Paris, is inaugurated, 674.
——Notable feat at A.I.E.E. convention (editorial comment), 287.
——Offices, power plants for (R. L. Young), D, 570.
——Ownership of world's, 1875-1930, *38.
——Per 100 population, 1875-1930, *38.
——Radio:
Voices across the sea (editorial comment), 391.
——Receiver, a high efficiency, for a horn-type loud-speaker of large power capacity (E. C. Wente and A. L. Thuras), D, 570.
——Transatlantic, first engineering session, 167, 321, 368.
Telephony (see also Financial and Bell System and Telephone, under Statistics):
——Carriers, 220 kv. (Roy B. Ashbrook and Ralph E. Henry), *495.
——Transatlantic, in 1927, 6.
Operating problem (K. W. Waterson), 399.
——Technical problem, the (L. B. Blackwell), 400
Television (A. Danvillier), D, 468.
——Demonstrated by General Electric Co., 164; (editorial comment), 134.

Television (Continued):
——Doctor Alexanderson demonstration (e.c.), 134.
——Symposium on, D, 366.
——Transatlantic, 373.
Televox:
——A popular man at electrical convention, *1409.
——Development of the (R. J. Wensley), D, 112.
Tennessee:
——Commission valuation contested, 1120.
——Eastern Electric Co.:
Attacks authority of Tennessee Commission over streams, 120.
Seeks to enjoin State Commission, 426.
Tax illegal, 673.
——Electric Power Co.:
Great Falls plant taps two watersheds, 599.
Lighting, effective daytime window, *210.
Stock sale, will resume, 125.
——Great Falls station, *61.
——Jackson Railway & Light Co.:
Brownsville-Ripley line, 372.
——Memphis Power & Light Co.:
Four-wire metering (E. A. Corum and F. L. Christenberry), *95; (editorial comment), 85.
Rates to be cut, but how?, 474.
——Railroad and Public Utilities Commission:
Attack authority of, over streams, 120.
Terminal:
——Low-voltage, 131.
Terms:
——Industry, definitions needed for (editorial comment), 186.
Testing and Tests:
——Ammeter, graphic:
Distribution losses, reducing (J. B. Moorhouse), 414.
——Arrester grounds, of (Edward Beck), *443.
——Brittleness for rubber and gutta-percha compounds (G. T. Kohman and R. L. Peek, Jr.), D, 1353.
——Cables:
Arcing on (D. I. Tucho-Kaufmann), D, 467.
Arc proofing materials (C. H. Shaw), 1339.
——Cable faults, locating underground, *1344.
High-voltage problems (T. N. Riley), *137.
33,000-volt (M. Hochstadter and E. Bowden), D, 214.
——Canada may set up electrical, bureau, 426.
——Central-station operation, limiting temperature in (V. T. Malcolm), D, *518.
——Concrete bus-structure (Willard A. Kates), *1379.
——Drills seek more oil 7,600 ft. beneath the surface, electric, 629.
——Equipment, loss; reducing distribution losses (J. B. Moorhouse), 205.

Distribution losses, reducing (J. B. Moorhouse), *348.
——Growing resistance (W. B. Craigmile), *861.
——High-voltage, standardize (editorial comment), 543.
——Insulator, pin-type, capacitance (Arthur L. Albert), *965.
——International rules for, of hydraulic machinery, 927.
——Lighting:
Where light means life (editorial comment), 237.
——Load, effect of sudden loss of (C. B. Hawkins, S. Murray Jones and O. E. Charlton), *1385.
——Load and voltage:
Distribution, reducing losses (J. B. Moorhouse), *296.
——Los Angeles Bureau of Power & Light:
Conductor movements influence line design (editorial comment), 695.
——Meter, Watt-hour performance improved with low-speed elements, *1392.
——Microscopic examination of some electrical insulating materials (Arthur B. Everest, D, 1352.
——Motor, "switch start," 131.
——New York Edison—United companies high-tension set for 132-kv. cable, *352.
——Oil burner (Harry A. Snow), 144.
——Oil burner laboratory, 216.
——Oil:
Cup for, improved (J. B. Wallace), *242.
——Oil, switch and transformer (J. B. Wallace), *413.
——Puncture, affected by strength of oil (J. T. Littleton, Jr. and W. W. Shaver), 759.
——"Pyrex," dielectric data on (C. L. Dawes and P. H. Humphries), *1331.
——Radio interference, sledgehammer test for source of, 295
——Relays, of:
Direct benefit of field (B. M. Jones), *908.
——Relays, field, of (W. M. Evans and R. J. Salisbury), *553; (editorial comment), 543.
——Residential water heating (R. R. Herrmann and K. R. McClung), *341.
——Service, of meter transformers (B. J. Brown), *859, 1351.
——Sheet brass, for:
Physical properties and methods of (H. N. Van Deusen, L. I. Shaw and C. H. Davis), D, 214.

Testing and Tests (Continued):
——Steam turbine, of a 12,000-kw. Zoelly, D, 671.
——Stevenson Creek arch dam undergoes severe, 882.
——Surge on isolated neutral network (R. Rader and V. B. Wilfley), *1281.
——Tennessee Electric Power Co.:
Lighting, effective daytime window, *210.
——Very high direct-current voltages (Erwin Marx), D, 672.
Texas:
——Central Power & Light Co.:
Victoria plant to be tripled in rating, 577.
——Comal Power Co., New Braunfels plant will be doubled, 72.
——Dallas Power & Light Co.:
Lighting, a simplified street hood, *916.
Transformer vault relay protection, *810.
Wires all underground, 577.
——El Paso Electric Co.:
Elephant Butte contract for, 1305.
——Gulf Power Co.:
Texas City plant will generate 6,000 kw., 520.
——Gulf States Utilities Co.:
Stock issue, 126.
——Hidalgo Utilities Co.:
To serve both sides of Rio Grande, 272.
——Houston will start "white way" for Democrats, 373.
——Houston Lighting & Power Company:
Budget for 1928, 121.
——Interconnection goes on apace in, 883.
——Louisiana Power Co.:
Elephant Butte power, new offer for purchase of, 1120.
Texas City plant, 1410.
——Pecos Valley Power & Light Co.:
McCamey, another unit for, 273.
——Power & Light Co.:
Transmission system (E. T. Keck), 749.
Trinidad station, burns lignite, *748; (C. E. Keck), *749.
——Presidio Light & Power Co.:
Carries electricity to remote spots on the Rio Grande, 324.
——Public Utility Commission demanded for, 373.
——Southwestern Gas & Electric Co.:
Shreveport-Marshall line begun, 1408.
——Syndicate Power Co.:
Colorado River development, 323.
——Syndicate Power Co. and west Texas objectors reach agreement, 425.
——Uvalde becomes strategic point in electrical service, 272.
——West Texas Utilities Co.:
Lake Pauline plant, 170.
Lines from Lake Pauline plant, 170.
Southwestern Light & Power Co., Vernon-Frederick line, 1408.
Therapy:
——Lamps in, Tungsten (M. L. Luckiesh), 1023.
Thermal method of standardizing dielectric power loss measuring equipment (J. H. Scott, H. W. Bausman and R. R. Benedict), D, 1352.
Thermionic phenomena (Eugene Bloch), 113.
Thermometer, recording, 282.
Thermostat and relay, electric immersion, 282.
Threading:
——Conduit (R. L. Dodd), *1334.
Thunderstorm, electrostatics of (A. W. Simon), D, 366.
Tile:
——Walls, strength of interlocking-rib (A. H. Stang, D. E. Parsons and A. B. McDaniel, D, 1353.
Time-delay undervoltage device minimizes interruptions (L. C. Hardesty), *706.
Time lag of spark and surface creepage (Matsunosuke Iwatake), D, 366.
Timing pot, portable, 282.
Tool for doing the job (editorial comment), 1052.
Torque:
——Instrument for measuring short-circuit (B. W. Penney), D, 112.
Towers:
——French claim many advantages for new, *456.
Trade literature and publications, new, 132, 182, 234, 284, 336, 386, 438, 488, 540, 590, 642, 692, 742, 794, 844, 896, 946, 998, 1048, 1130, 1178, 1276, 1324, 1374, 1422.
Trade opportunities, 132, 182, 234, 284, 336, 386, 438, 488, 540, 590, 642, 692, 742, 794, 844, 896, 946, 998, 1048, 1130, 1178, 1276, 1324, 1374, 1422.
Traffic:
——White strips make poles conspicuous to (R. E. Cunningham), *758.
Transformers:
——Bank aids system changeover, portable (Maurice D. Smith), *1014.
——Box installation, three-phase pole-top instrument, *415.
——Data plate placed [illegible]

# Electrical World

*Published by McGraw-Hill Publishing Company, Inc.*
W. H. ONKEN, JR.
*Editor*

VOLUME 91 *New York, Saturday, January 7, 1928* NUMBER 1

## *Progress All Along the Line*

GOOD indeed is the promise of 1928 for the electrical industry. The record shows that it is constantly marching on, undaunted by difficulties and undismayed by problems of the future. A slight slackening of pace is discernible, but when streams become wide and deep rapidity of acceleration is no longer their chief characteristic. They are none the less invincible in their onward flow and at the same time are, if anything, more tractable to the needs of commerce and industry.

The credit of the electric light and power industry has improved and will continue to grow better, so that the yearly financial problems of the utilities are no longer of such tremendous concern, however Gargantuan the appetite for funds may be. More than two billion dollars was acquired in 1927 for refunding and other purposes, and to get it entailed less worry than the raising of half a billion dollars five years ago. This augurs well for the other branches of the electrical industry, for with financial and engineering problems well in control greater executive attention can be directed toward enlarging the market for electrical energy and the translating apparatus which goes with it.

The tendency of the times plainly indicates that the most important function of the future will have to do with sales management. In both the manufacturing and the utility branch engineering has brought down the cost of production. Economies have been effected all along the line so that a standardized low unit cost of production may be said to have been attained. It is not so with distribution. While engineers have done their part and have done it well, the commercial man is still groping. Before long he will, he must be up and doing. Money is being spent faster than the actual demands for service justify. Fewer and fewer people now lack the advantages of electric service. The use of energy per capita, however, is still ridiculously low, indicating that both manufacturer and utility have done a mediocre sales job. Fortunately, both realize that this is true and are preparing to meet the issue.

* * * *

## *Dedicated to Service*

DISCUSSIONS of the electrical industry are very apt to put emphasis on size without consideration of the economic fundamentals which underlie the millions and billions so glibly quoted. Size is important only as it makes possible a more effective disposition of the benefits electricity brings to modern civilization. Underlying the splendid growth of the electrical industry are values and services which have made growth inevitable.

During the past year material accomplishments have been recorded, but of far greater importance is the fact that the industry has gained a clearer understanding of its duties and its obligations. Industry consciousness exists that there is a job to be done and that co-operative planning and co-ordinated action are the tools to use for increasing electric service. The manufacturer, the light and power company, the communication interests and the transportation group have a common meeting place and a common opportunity for greater service and consequently better business. The industry is too big and interests are too closely related to permit a haphazard growth arising from the unplanned actions of the separate branches, and the past year has brought about a better conception of the potency of the old phrase "In unity there is strength."

American industry tends toward greater economy in production and marketing, and this results in narrower margins of profit, which are compensated for by a larger volume of output. The electrical industry has kept abreast of this great movement and in addition has furnished the equipments and methods which have made possible the economic developments in other industries. It is dedicated to industrial service as is no other industry.

* * * *

## *Price of Future Growth*

ABOUT 70 per cent of the total construction budget of the power industry this year will go to provide distribution facilities. For it is an accepted principle that a utility company should spend money in sensible proportions to take on additional business. A capital investment is held to be justified if a proposed line extension offers sufficient load. But now the industry faces the question of how much should be invested to secure this business. And this question presses for an answer this year as never before.

It is an astonishing thing to men of other industries, the extent to which the power company in the past has been able to escape the necessity for spending money to develop sales. Manufacturers in other fields are constantly compelled to make courageous appropriations for invading this market or supporting that. Plant investments are also entailed. That is inevitable. But their chief consideration in budgeting must ever be, how much can be spent to create a larger volume of business? The executives of the power industry have never had any trouble with this as a major problem. The wheel is now turning, however, and the financial planning of the future must deal more largely with the apportionment of money to be invested in selling. It will no longer be enough to provide pole lines for taking on new customers. Growth will come from now on increasingly through the development of more sales to present customers—and in the residential field.

The waiting market for electricity in industry and in commercial use is still vast. It is a simple clean-cut selling job that needs much man power, much intelligent sales engineering. But the way is clear. The more complex problem lies in the homes of the 17,590,000 customers now connected and using the service in so pitiably small a way. And here four necessities must be faced and overcome:

1. A public consciousness, a public interest and a public desire for complete electrical equipment must be created. That will require advertising on a scale beyond anything the industry has ever attempted.

2. The present obstacle of inadequate house wiring must be overcome. And this means that wiring must be sold vigorously and persistently that appliances may be conveniently used.

3. The selling of appliances must be organized on a far larger basis so that the standard of household equipment may be rapidly raised. The present progress does not even keep up with the growth in customers.

4. Rates must be made right so that the purchase and use of more appliances will be encouraged.

The power industry stands in the marketplace seeking business in competition with other industries that now hold the public interest. Success in selling will not come for the wishing. The situation calls for intelligent policies, generous financing, courageous leadership and adequate man power. That will be the price of future growth.

* * * *

## Statistics Need Interpretation

FIGURES are dangerous things in unskilled hands. Industry statistics, when used by academic statisticians and by men who do not have an intimate knowledge of the industry whose operations are evaluated in statistical terms, are apt to lead to erroneous deductions. Electrical industry statistics afford enormous totals. These totals are quite accurate, furnish basic measures of industry accomplishment and serve as guides for building a better industry. But the totals involve definitions of such terms as "capitalization," "value of plant and equipment," "generation," "transmission," "distribution," "power," "lighting," "commercial" and other expressions which are understood by men of the industry but may be misinterpreted by the layman. In this issue of the ELECTRICAL WORLD these words are defined, but too frequently the casual statistician or lay reader makes his own definitions, with resultant misapprehensions.

It is unit and average values that give the most erroneous impressions. It is human to generalize. The layman likes to say a steam power station costs so many dollars a kilowatt and a hydro station so many more dollars per kilowatt, and he arrives at these averages by using total industry data. An electrical man smiles at such statements as they are normally applied. Then again average unit rates may be computed and used as generalized figures, or some one may become a financial wizard by using a little arithmetic and total values. Such expositors do not know industry conditions or the proper interpretations to be placed on these values, and it is difficult to explain to them that unit statistics are no better and no worse than total values and serve as the same yardstick for measuring the relative growth or trend of the industry over a period of years.

This country now makes a fetish of statistics and accepts them in large doses from many sources. Many of these statistics have no real father or mother but are never at a loss for foster parents. Official orators and publicists find the soft spots in hard-headed business men through the use of statistics. Figures support the official foolishness so prevalent in American commercial life and are the false as well as the true guides to business prosperity. They should be used intelligently or not at all.

* * * *

## Electrical Budget for Home Owners

AMERICAN homekeepers have adopted the budget. They are beginning to think about their budgets for next year. Shoes, clothes, theaters, the automobile and many other items will find a place in this budget, and plans will be made for the purchase of commodities and services designed to increase the comforts and pleasures of living in 1928. But the electrical industry has not sold to the home owner the electrical item for his budget. The light bill may find a place, but too frequently it will be labeled "incidental expense."

Large plans are in the making in the electrical industry for the sale of its products and services to the American home. Why not make the home budget an objective in this program? The 1928 budgets of homes everywhere in the land should include allocations for the electrical betterment of dwellings as well as for the replacement of furniture, draperies and floor coverings. Such appropriations need not interfere with the later financing of "red seal" and other installations over a longer period, and the habit of including electrical betterments in annual household budgets should be formed and acted upon from this time forward. Innumerable customers of electric service companies have yet to realize that a properly balanced household budget should provide for systematically improving the home along electrical lines, and in the coming months lies a real opportunity for the industry to influence homemakers in a most desirable field.

* * * *

## Profitless Prosperity

INDUSTRY in the United States has for several years tended toward a volume basis. In general, great manufacturing enterprises are conducted on the Ford plan of quantity production and small profit per unit. This is satisfactory as an expedient to overcome localized distribution of products and to meet an economic trend, but it does not lead to anything, ultimately except a "buyers' market"—that business situation in which the purchaser dictates the price and the seller takes what he can get, knowing that if he does not do so his competitor will.

Reports from almost every field indicate that industry is reaching this condition. Buyers are learning that they can get materials at their own price. As a consequence, business is showing little, if any, curtailment in volume, but the poverty of an ungainful trading margin is upon it. Merchandising counselors advise a reduction of distribution costs, but this is only a temporary alleviative in such cases as it may be remediably applied.

A prominent economist says "all the great basic raw-material-producing industries, such as coal, chemicals, agriculture, metal mining and some of those closest to them, like the wool and cotton textiles, leather, and lately iron and steel, have certainly shared little or none of the restless, shifting and selective prosperity which has been so extravagantly hailed. Thanks to the easy-money policy of the Federal Reserve System, the stock market has been doing some fancy aviation, but there has been no real business boom in this country since 1923."

All extremes are untenable. Life and activity tend to intermediation, and conditions must come closer to those of a "sellers' market" than they are now before there can be "good business." It is useless to talk of sales volumes and unbelievably large funds in the banks and invested at absurdly high prices in stocks and bonds. The return on the investment is the only factor that possesses ultimate significance. The solution is simple but exceedingly difficult of achievement. A fair price to the purveyor—he to insist upon it and the buyer to pay it. This requires courage of a high order and unprecedented co-operation on the part of the producers as well as understanding and fairness on the part of the buyer.

* * * *

## *Thrift in Engineering*

ENERGY losses in the systems of the light and power industry of America last year were equal to the total energy generated in 1913. The losses were twice as large as the electric railway load and nearly equal to the total lighting load. These losses—14,000,000,000 kilowatt-hours—represent 20 per cent of the total energy sold. Here is something for the industry to think about. Engineers can reduce these losses. They have done it on several properties, and the economic limit of reduction is easy to fix. But most engineers do not like to tackle the job. They would rather design power houses to gain a fraction of one per cent in efficiency or focus their attention on problems connected with the design of new substations. Big things involving money expenditures are more interesting to most men than little things and money savings. The natural, undisciplined human being is extravagant rather than thrifty.

On every property loss reduction should receive the attention of the best engineering talent. It is not a task for a maintenance man or a construction foreman. The way to reduce losses is to make precision measurements and precision installations and to institute precision operating methods. Each machine, transformer, transmission line and distribution service must be measured, weighed against the service required and revamped to develop its maximum operating economy. Precision housekeeping must go on day after day and week after week. A loss-reduction maintenance crew must go much further than the ordinary maintenance crew.

* * * *

## *Keep the Banker in His Bank*

THE light and power industry has been built by able men. Each large property or group of properties is generally dominated by the personality of the man who has fought to victory on the firing line. He has handled the public, the operations of the system, the finances and the policies, and his strength has made possible the achievements of his company. The industry is fortunate that these men have been behind it during its life of forty years and still control the destinies of most of the properties.

But conditions will change. These men cannot live forever, and very often no qualified subordinate stands ready to step into their shoes. Again, the business has become so big that one-man operation has disadvantages, and the committee type of executive control common to modern business is likely to come into being. Still another factor to be weighed is the fact that enormous amounts of utility securities are now in the hands of bankers. Many of these bankers have developed a practice of directly participating in the control and management of the industries whose securities they hold. Banking activity of this sort started on a small scale, but in some industries it has progressed by leaps and bounds.

Banking control of electric utilities is not desirable. Bankers are ultra-conservative, whereas the light and power industry has succeeded by quickly grasping and using the new and better equipment and methods that have evolved with the rapid development of the science of electricity. Success in the utility business is based on good public relations. Managements must "feel" their public and be responsive to its moods. Only those who actually live among the customers they serve can be fully responsive to the customers' needs. Here again the banker is out of his element. Another element in banking control is that bankers are out to make money first and last. They are cold-blooded business men and may force financing or start projects which will make money but which will not be conducive to better and more economical service to the public. No rightly actuated executive in the light and power business has made money his primary object in building a property.

Weighing these elements in the scales, it is seen that banker control of a public utility business is bad for the business and bad for the public. It is to be hoped that men will be found in the utility industry who have the strength and courage to tell their bankers to remain in their banks.

* * * *

## *The Business Outlook for Electrical Men*

IN THESE pages many leaders have contributed their opinions as to the business outlook confronting the electrical industry at the beginning of this new year. Boiled down, it resolves itself into the consideration of the several favorable and unfavorable economic factors which stand out in the prospect for American business today. These may be taken as follows:

*Favorable Factors*

1. No inflation of prices.
2. Ample supply of credit at low rates.
3. Small inventories and no speculation in commodities.
4. Labor well employed at high wages.
5. Abundant crops.
6. General construction in line with 1927.
7. Prospect of record automobile production.
8. Further federal tax reduction.
9. Foreign trade increasing.
10. European conditions steadily improving.

*Unfavorable Factors*

1. Relatively unsatisfactory earnings in manufacturing industries.
2. Presidential election presents political hazards.
3. Germany's maximum reparations this year may disturb European economics.

As a balance sheet, the favorable influences would seem to so far outweigh the unfavorable as to give every reasonable expectation of what President Coolidge has termed "a comfortable prosperity" in 1928. The forces which make for stability in the business world appear to be in dominant strength. It is safe to say, therefore, that prosperity in the electrical industry this year is going to be largely what electrical men make it. If the four organized branches of the industry are serious in their decision to join hands and go forward enthusiastically with a broad program of market development, we should create our own prosperity. For our era of sales is just beginning and our opportunity lies ahead.

*Courtesy Great Northern Railway and Stone & Webster*

LINE CREW AT WORK ON 110,000-VOLT LINE FOR GREAT NORTHERN RAILWAY AT THE SUMMIT OF THE CASCADES, WESTERN WASHINGTON

# *Light and Power Utilities Will Spend $900,000,000 in 1928 for Additional Facilities*

# 1927 1928

IN 1927 more than 46,000,000,000 kw.-hr. was generated in the fuel-burning stations of the light and power industry and 29,000,000,000 kw.-hr. in the hydroplants. For several years more than 60 per cent of the energy used has been generated from fuel, and this percentage is apt to increase in the future. Economic, political and engineering handicaps to waterpower development become greater each year; because of these handicaps and because of advantages possessed by fuel-burning stations, it becomes increasingly difficult to find economic justification for large water-power and transmission projects in localities distant from load centers.

* * * *

SINCE 1913, the total energy generated in the light and power industry has increased six times. The energy used for lighting has increased six times, that used for power eight times, and that used for railways less than twice. Yet in this period the losses of the systems have increased five times; they are twice the railway load and nearly equal to the lighting load. Here is a big job for utility engineers.

* * * *

THE GROSS revenue of the light and power industry is now $1,783,000,000. Lighting customers pay $1,000,000,000; power customers, $500,000,000; railways, $60,000,000, and intersales among utilities account for $129,000,000. Sales of energy among utilities have doubled since 1921, and this fact affords economic justification for the growth of interconnected transmission systems.

* * * *

THE light and power industry used more than 37,000,000 tons of coal in 1927. Each year for several years the consumption of coal has increased at the rate of about 1,000,000 tons a year. This rate of fuel consumption has been constant despite the rapid increase in generated energy, because major economies in the use of fuel per unit of energy generated have been brought about. In 1927, for example, through these economies the industry saved an amount of fuel equal to the entire industry consumption in 1913 based on the unit fuel consumption in 1913. The 37,000,000 tons used is a small proportion of the 700,000,000 tons of coal mined each year in this country, and the engineers of the utility industry are not conceding that they will not bring about still greater efficiency in fuel consumption.

* * * *

THE Atlantic and North Central States generate nearly 75 per cent of the total energy generated in this country. The South Central states have increased their generation most rapidly since 1922; the Far Western states are second in rate of growth and New England states have grown very slowly in the same period. In no section of the country is there evidence of saturation; markets are yet available equal to those now served.

* * * *

SOME loads attract keen commercial interest. With a use of energy averaging 1 kw.-hr. a day and a monthly revenue of $2.50, there is concrete evidence that electric service can be intensified in American homes. The value of the service is evident; home owners desire the service but it must be sold. The home load should be doubled in 1928.

* * * *

WE ARE now experiencing the most remarkable advance in productive efficiency in the history of modern industry. The first industrial revolution was brought about by the invention of machines and the present revolution is brought about by the application of new processes and methods to the use of machines. It is not electricity in itself nor electrical machines in themselves that make for industrial prosperity; it is the electrical method. Continuous production under precision conditions with a maximum output per unit of capital, space and labor is made possible by the electrical process of production; the automotive industry, for example, is producing three times the number of cars it did in 1914 in the same time with the same workmen. Electricity makes possible a tremendous mechanization of production processes.

* * * *

WITH generating stations aggregating 28,990,000 kva.; with thousands of miles of high-tension transmission lines; with other thousands of miles of distribution circuits, and with hundreds of substations, buildings and other facilities, it might be thought the utility industry was ready to satisfy all service demands. But the demand for electricity is on the increase and the market is not saturated. During 1927 these utilities spent $760,000,000 for additional facilities and their budget for 1928 aggregates over $900,000,000. This is an enormous sum to be spent wisely in one year.

* * * *

IN 1927 the gross revenue of the light and power industry was $1,783,000,000 and the net was $1,017,000,000. This represents the generation of more than 75,000,000,000 kw.-hr. for the service of 21,694,100 customers. More than $8,000,000,000 is now invested in facilities for giving this electrical service to the nation.

* * * *

WITH 6 per cent of the world's population, the United States has about 60 per cent of the world's telephones. Fifty years after the first commercial telephone line finds 18,500,000 telephones in use in this country. Telephony is distinctly an American art.

* * * *

ELECTRICAL manufacturers of heavy equipment did a gross business of about $1,000,000,000 in 1927. Appliance and radio manufacturers did a business of about $2,000,000,000 in this period. These totals are enormous, but the check on prosperity is found in net earnings and in this respect many manufacturers say margins of profit have been very narrow. The electrical industry should have a prosperous group of manufacturers, for they are chiefly responsible for new developments in electrical equipments. Their earnings should support a development program.

AMERICAN industry is only 75 per cent electrified. Much of this electrification has been done crudely and with the idea of substituting electric power for mechanical drives. But industry is awake to a different idea in the use of power. It realizes that electrification is a process and not a group of motors. Production per unit of factory volume can be increased by the use of electric heat, electric controls and electric motors—this use to be fixed by a production process that utilizes the maximum possibilities of the electrical method. There is a big business in industrial electrification.

* * * *

THERE are, as the old year ends, 4,409 light and power systems in this country, and they serve 21,694,100 customers. Investors have spent more than $8,000,000,000 for plant and equipment to give this service. Over $2,000,000,000 of the securities of light and power companies were sold in the money markets during 1927—a quarter of the total securities sold in this country. Investors have faith in the electrical industry because of its honorable record for honesty and service.

* * * *

IN 1907 there were 1,946,979 total customers of electric companies; the lapse of twenty years has multiplied this figure by more than ten and in 1927 domestic customers numbered 17,596,000. About 63 per cent of the people now live in homes served by electricity and during the past few years the net increase in customers each year has been about 1,500,000. New customers will continue to be had, but there is an enormous market for giving more adequate service to existing customers.

* * * *

DURING 1927 all points in Great Britain and the United States were put into touch with one another through transatlantic telephony. Cuba and Canada have also been added to the connection, which gives 10.5 hours of daily communication facilities. Another notable telephone interconnection is the completion of a direct line from the United States to Mexico. World-wide communication is now established on a commercial basis.

# Executives Optimistic About Industry Conditions

## Interconnection Based on Economic Principles

By Henry I. Harriman

*Vice-Chairman Board of Directors New England Power Association, Boston, Mass.*

ONE of the outstanding features of electrical progress in the last year has been the steady growth of interconnections between large electrical companies throughout the country and the general recognition on the part both of the companies and of the public that there was mutual gain in such interconnections.

H. I. HARRIMAN

These gains may be classified under the following heads:

1. It enables the most efficient plant to carry a substantial part of the load.
2. It decreases the amount of reserve capacity which each separate plant must keep for emergencies.
3. It gives assurance of safety and continuity of service.
4. Through diversity it tends to reduce the total electrical peak of a given area.

The developments in high-tension cables will also be an important factor in extending interconnections between large power stations, as many of them are located in the heart of thickly settled sections where high-tension overhead lines cannot be built. Both New York and Chicago have cables operating successfully at 132,000 volts, and cable makers are now discussing 220,000 volts.

One of the most important factors in the growth of interconnections is the general recognition that they can be carried out by the voluntary action of the various companies without effecting consolidations of companies and without changes in existing laws. In fact, the interconnections of large generating plants may be considered the natural outgrowth of economic principles.

---

## All Promises Kept During Past Year

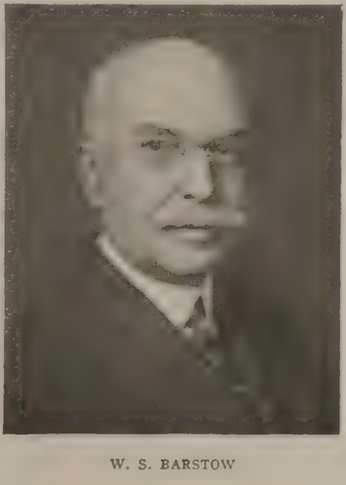
By W. S. Barstow

*President W. S. Barstow & Company*

THE year 1928 opens with the electrical industry established upon a firm foundation and the impetus given by public appreciation will carry it far beyond past accomplishments.

No one could have visualized forty years ago the present state of the art, and no one can visualize today its position forty years hence. It could never have been imagined that the seed sown but a half century ago could blossom into an all important factor in national progress.

The past year of physical and financial expansion has continued to follow strictly economic laws. In the beginning of electric service the kilowatt hour (if this unit had been used) cost the public more than twice what it does today. What is, however, of more importance to general public welfare is that at the present time, due to large interconnected generating plants and expansion of distributing systems, electric service has been made available to almost every section of this country. Great results have been attained in the past and the future promises even more. We speak of progress and prosperity of a nation and yet often do not realize the important part played by electric service in increasing the individual efficiency which results in such progress and prosperity.



W. S. BARSTOW

## Industry Will Grow to Extent It Serves

By J. J. O'Brien

*President Byllesby Engineering & Management Corporation*

AS LONG as electric utilities continue to increase the efficiency and production of individuals and industries they will grow, in my opinion. While at present general business conditions in the territories in which Byllesby companies operate (with some few exceptions) are not so good as a year ago, I do not believe that anything approaching "hard times" is in prospect for 1928. Electric utilities will continue to grow; they will grow more rapidly at one time than another, but even in lean times they possess the ability to show progress and maintain earnings at a point sufficient to secure the inflow of new capital for additions and extensions. Only extremely unwise political action can prevent them from continuing in healthy condition—that is to say, in position to render adequate public service based on a sound financial status.

J. J. O'BRIEN

---

## Service Expansion— An Achievement

By Britton I. Budd

*President Public Service Company of Northern Illinois*

DURING 1927 the electrical industry moved steadily forward, its progress being marked by conservative development in many branches rather than by any single outstanding achievement. The extension of adequate utility

B. I. BUDD

service to suburban areas has enabled these areas to enjoy such conveniences as were formerly afforded metropolitan communities. This suburban development now is acting as a magnet, drawing heavily on our congested centers of population and gradually enlarging the scope of rural utility service.

A number of satisfactory experiments in farm electrification were conducted by utility companies during the year, with the result that the application of electrical energy to farm operation has taken a long step forward. Numerous superpower interconnections between neighboring companies were completed during the year, providing additional assurance of uninterrupted service to customers and investment economies to the companies. All of these things have contributed to the sound financial position of the industry as a whole.

## *Southeast Plans $40,000,000 Budget*

By T. W. Martin

*President Southeastern Power & Light Company*

The forecasts of the increased demands that will be made upon the system of the Southeastern Power & Light Company during the next twelve months have now been completed and we are actively going forward with plans to meet these demands. While there has been during the last few months a slight recession in business activity in the territory, this has been overcome and building activities are substantially above those for the corresponding period of 1926. The trend of electric power demands has been constantly upward and we are making our plans to supply a total energy demand of 2,500,000,000 kw.-hr., as compared with 2,100,000,000 kw.-hr. for 1927.

In other words, we are expecting a 20 per cent increase in the output during 1928. The demand for power is now a well-recognized barometer of business conditions, and the demands on our system from present customers and the many new activities being undertaken in the territory served indicate that we must make provision for greater and still greater demands.

To the end of meeting the expected demands, we are making plans for additional generating facilities and distribution lines, requiring an estimated expenditure in 1928 of $40,000,000. This will include part of the cost of an additional steam plant to be erected in Alabama in the Warrior coal fields, recently announced, construction of which has been started, and the first unit of 80,000 hp. capacity should be in operation during the fall of 1928. This new station is designed to permit an ultimate capacity of 270,000 hp. to be developed as demand requires and is in addition to the 100,000 hp. Gorgas plant.

We also expect to bring into operation in the fall of 1928 the Jordan dam, with an initial installation of 144,000 hp., and the Tallassee plant, with an ultimate capacity of 75,000 hp. Plants are also under way for the beginning of construction in the near future on additional power developments on the Savannah River and other streams in Georgia.

T. W. MARTIN

Upon the whole, we look forward with confidence to the year 1928.

## *Expects Expansion Despite Conditions*

By Martin J. Insull

*President Middle West Utilities Company*

Whatever the course of business as a whole during 1928, the electric industry will inevitably continue to expand. And for the same reasons that the industry as a whole will expand, the properties under the direction of so-called "holding" companies will grow relatively more.

The reason lies in the stage of development at which the electric industry now stands—a stage far from saturation. Since the "holding" companies serve chiefly non-metropolitan territories, in which development has not yet progressed as far as in the more densely populated centers, they naturally face a continual and more emphatic growth. The small communities and the farms, mines, oil fields, quarries, irrigation and drainage systems and other such power users spread over the countryside constitute a field of development which is far from completely electrified.

Companies operating in such territories face both an external and internal growth. It is logical to suppose that they will continue to bring into their systems, from time to time, isolated local plants in communities the service requirements of which can be more adequately met by a larger system. In addition to this they must meet a constant growth in the demand for service in territories already served. There are small communities that have no electric service at all to which transmission lines must be extended. Rural electrification is in its infancy. Domestic use of electricity both for lighting and for labor-saving appliances can be made much more general.

This increase in demand for electric service appears simple enough in the homes and industries where it is taking place. The raising of new capital with which to build the necessary generating and transmission facilities to meet the requirements of any one individual is a simple business operation. When, however, each such operation is multiplied by millions—the population of the country—it results in a staggering figure to which "trust" and "octopus" are unthinkingly applied. I think those who react in this way to the growth of the electric industry fail to realize the size of the country, which is the explanation of large figures which seem to cause alarm. The companies whose service is constantly being extended are fully understood by the customers whom they are serving and the investors whose capital they are enlisting in this work. Such opposition as there is is an opposition growing out of fear of size—a size that the development of the country necessarily requires—and is not the feeling, I am confident, of either the customer or the investor toward the electric industry.

MARTIN INSULL

## *Stability and Progress Manifested*

By Charles L. Edgar

*President Edison Electric Illuminating Company of Boston*

THE two most important things that have happened to the light and power industry in New England during the last year are, first, the prominence which was given it by the recent floods in New Hampshire and Vermont, and, second, the publicity given to its affairs through the New England Council.

Both the public and the technical press have very clearly brought out the fact that wherever power companies have improved the rivers of New England, primarily for their own purposes, they have, in fact, controlled the flood problem of these various rivers. One river in particular, the Deerfield, controlled and regulated from its source to its mouth, stands out as a shining example of the effect that this development has had upon the control of its waters during the time of flood. If all of the rivers of New England, as far as commercially possible, had been developed to anything like the extent of the Deerfield River, the damage from flood would have been almost negligible and would have attracted very little attention throughout the country.

Up to within a year or two ago there had been a pronounced feeling in some parts of New England that the power companies were not living up to their opportunities and that their development was lagging behind that in other sections of the country. Through some of the committees initiated by the New England Council a very comprehensive study of the actual facts was made during the last year. It was shown beyond question that, relative to its population, New England, from the standpoint both of investment in its power companies and in their output, is ahead of the rest of the United States and that the proportion of kilowatt-hours manufactured by water power and by steam power in New England alone is almost exactly the same as for the entire United States.

Through these same committees a scheme has been developed by which those companies engaged in interstate transmission of electric power can have their activities regulated to the same extent as if they were engaged only in intrastate transmission. This has been brought about by inserting a clause in interstate contracts, agreeing to abide by the decision of the commissions of the two states sitting jointly, all this, of course, without the intervention of the federal government.

C. L. EDGAR

## *Election Year No Menace*

By B. C. Cobb

*Vice-President Commonwealth Power Corporation*

DURING 1927 public utilities, and especially the electric power and light industry, forged ahead at a remarkable pace. I am inclined to think it will continue to do so in 1928, although new construction budgets for the plant and facility expansions will be somewhat under the 1927 figures. Present indications are for continued prosperity during 1928. There will be ups and downs and declines in certain lines, but in that respect 1928 should differ little from 1927, and surely no one can say that 1927 was not a prosperous year notwithstanding the fact that some lines of business did not maintain their rate of output.

B. C. COBB

The power and light industry is growing rapidly, with tremendous benefit to customers and the public. There is no such thing as an electric trust, about which we hear so much, and any federal investigation that may be made of the industry can do no permanent injury.

While both electric power and gas consumption are expanding rapidly, there is ample room for both, and neither need fear competition from the other.

The electric railway industry is apt to meet more problems than the other branches, as the private automobile has created serious competition. The public is fully alive, however, to the importance of electric railway service, and all communities throughout the country, with the exception of New York City, have recognized that the 5-cent fare is a thing of the past and that if the electric railways are to continue to serve, they must be allowed to earn.

C. W. KELLOGG

Some uncertainty has frequently attended election years and some anticipate business hesitation on this account during 1928. In my opinion, this does not mean as much at the present time as it used to mean, especially if the candidate whom the public wants is nominated and elected to the Presidency, as I think will be the case.

## *Industry's Problems Are Being Met*

By C. W. Kellogg

*President Engineers Public Service Corporation*

THE year 1927 has given renewed proof of the fundamental stability of the light and power industry through the continued upward march of its earnings in the face of a recession of general business activity, which was particularly noticeable in the latter half of the year. Probably the outstanding development of the year has been the realization by home and foreign observers and American labor of the important contribution which the application of electric power to industry has made to the prosperity of the country and the maintenance of high wages. It has been a good year—a year of progress. The continuation of the present favorable trends depends in large measure upon the policy and efforts of the industry in maintaining, improving and extending its service.

I think there is no doubt that 1928 will be a good year for the light and power industry. It will be affected somewhat, though less than other industries, by the general prosperity of the country, the prospects for which are good from the present outlook. In any case, the continuation of vigorous merchandising policies should bring some new business to the industry regardless of general business conditions. With the continuous development of uses for electric service and electric power in many lines, particularly in the American home, I can see nothing but a prosperous future for the industry. We are always confronted with problems; the most important ones now perhaps are the extending of our service to rural territory on a fair basis to the farm population served and to the investor who furnishes the money, the protection of the industry from unwarranted attacks and the maintaining and increasing of public confidence in the industry, both among our customers on the one hand and among our investors on the other. All of these problems are being met intelligently, I believe, and will be worked out to the best interest of all concerned.

## *Commercial Enterprise Is Vital to All*

By Luke C. Bradley

*President Narragansett Electric Company, Providence, R. I.*

IT IS the duty of the power companies to bring to the attention of the people as quickly and completely as possible the comforts and blessings of the varied and manifold uses of electricity. The central station is the best clearing house for this movement, for the art develops rapidly from many sources and the electric shop is the best agency for creating electrical atmosphere in the community. If the utility company admits its responsibility here, it must display and sell appliances. The electrical dealer is not in business for altruistic motives, and the utility is not interested in the sale of appliances *per se* so much as in popularizing electrical service. Of course this means added revenue, but it means increased business for the dealer through a more general community consciousness of electricity and more rapid progress through the greater ability of the central station to keep abreast of the latest advances and make them available to all. Central-station merchandising is the greatest spur to contractor-dealer prosperity ever put to work. If our homes and business houses continue to accept electricity in social and business life, the business of the central station will increase enormously and the extent of the increase will enable the utility to make such rate reductions from time to time as may be economically justified. Thus commercial enterprise is vitally essential to increased prosperity for the electrical industry and the general public.

L. C. BRADLEY

O. H. CALDWELL

## *Radio Broadcasting in 1927 and 1928*

By O. H. Caldwell

*Member Federal Radio Commission*

THE year 1927 made radio history in several important respects. A basic law for radio control and regulation was passed by Congress. Television, or "seeing by radio," was accomplished and widely demonstrated. The lampsocket receiving set became a commercial product, merchandised on a large scale. Adequate radio channels have been cleared reaching into every city, village, rural, farm and remote mountain dwelling in America. And by international agreement among 70 nations, future operations and developments in the whole radio spectrum have been outlined and protected from interference.

Looking forward to 1928, interesting possibilities present themselves. In the short-wave region, we may expect during the year a rush of applications for channels, which in its commercial, industrial and economic reverberations will make the recent episode in the broadcasting band seem mild by comparison. Aside from all other communication demands, it is clear that future aviation progress will depend wholly upon these short waves for communication to airplanes in flight. In the broadcasting band, through various methods of synchronizing the carrier frequencies of stations, we may succeed in multiplying by several times the carrying capacity of existing channels for regional stations. Chain operation on not one but on three or four frequencies (instead of 20 or 30) may further economize our precious channels. Single-side-band transmission may cut the present ten-kilocycle separation nearly in two, further doubling the channels. Meanwhile broadcasting service in cities may during 1928 start on its inevitable transfer to local wire systems (telephone or electric light), leaving space radio to serve the open spaces.

In general, therefore, during 1928, the spotlight of public interest in radio, as of invention and commercial development, will turn upon the long reaches of the radio spectrum *below* the broadcasting band.

## *Utilities Are Conscious of Responsibilities*

By H. T. Sands

*President National Electric Light Association*

THE character of the service rendered by electric light and power companies makes it imperative that plans be made and facilities provided in anticipation of the demands of the public. Whether or not we are to experience a recession in industrial activity during 1928, such as we have witnessed in other presidential years, the electric light and power industry must of necessity continue with its plans for expansion and development. The industry is constructively planning for the future and substantially along lines which have been proven to be sound and in the interest of both the public and the investor.

The outstanding feature in generating equipment is the constantly increasing size of units, with attendant reduction of production costs. The work of interconnection, the soundness of which has already been demonstrated, will doubtless be carried forward in an increasing measure during the coming year. The tying-in of isolated properties into interconnected systems, which are in turn connected with both steam and hydro plants, will make possible the greatest use of the water powers of the country and assure reliable electric service distributed over wide areas.

The extension of electricity to farm homes and farm work promises to continue with accelerated pace during the

H. T. SANDS

R. F. PACK

next twelve months. Out of the coöperative effort now being conducted on experimental farm lines in twenty-one different states, both the industry and the farmer are constantly learning new uses for electricity on the farm.

The important work of improving and maintaining sound public relations is being carried on by some of the ablest executives in the industry. The results of this work are apparent in a more sympathetic understanding of our industry and a larger measure of confidence in its integrity and stability.

The industry looks forward to the twelve months just ahead fully conscious of its responsibility to the public it serves and to the investor whose money makes possible its service.

## *No Fear of Impartial Investigation*

By R. F. Pack

*Vice-President and General Manager Northern States Power Company, Minneapolis, Minn.*

OUR industry must sail through a little squall at Washington, where a number of matters directly affecting the electrical business are under Congressional consideration. Provided we ourselves refrain from becoming panicky, I think there is little or nothing to fear for the following reasons:

1. The people themselves are opposed to the government engaging in the electrical business. This is indicated not only by expressions of opinions of individuals all over the country but by the vote in the only three states where it has been put to a test at the polls. In California state ownership was defeated three times by ever-increasing majorities. It also was defeated in Oregon and in South Dakota.

2. Therefore it is not surprising that a survey shows that 90 per cent of all daily newspapers of more than 5,000 circulation are editorially opposed to government ownership and operation of public utility companies.

3. Of our 435 Congressmen and 96 Senators not more than one or two are avowed socialists, and certainly not more than 25 have any sympathy whatsoever toward the theory of government ownership, and I think we have every reason to believe that whatever comes before this Congress will receive fair and impartial treatment. We have no right to expect anything more.

4. While here and there, there may be something to criticize in our industry, just as there would be in any young industry which has grown to major proportions within a comparatively few years, there is vastly more for which we are entitled to feel justly proud. I believe the people to be inherently fair, and therefore have no fear of an impartial scrutiny of our history.

5. For years we have been building a cordial relationship with our customers on a foundation of good service, fair dealing and courtesy, and the business wisdom of such a policy will make itself manifest now.

We have little to be ashamed of and much to be proud of. It is our business to see that the truth goes before the people. The only thing I have ever feared is ignorance. Congress may readjust our sails a bit, but I am confident we shall emerge from the Congressional squall an even better industry ranking high in public confidence.

R. H. BALLARD

## *"Complete Electric Service" for 1928*

By R. H. Ballard

*Executive Vice-President and General Manager Southern California Edison Company*

IN MY opinion, 1928 will see the eyes of the electrical industry focused on commercial activities and the minds of electrical men concentrated on the problem of increasing our business with existing consumers. The modern six-room house occupied by a family with an income ranging from $3,000 to $5,000 can use from 2,500 to 3,500 kw.-hr. a year—to the great comfort and economic advantage of the entire family. To do this their annual operating budget would not be increased and they would be using an electrical standard only in keeping with their standards of dress, amusement, education and transportation.

We can advocate a greater use of electricity with all sincerity, because it means better food, better eyes, better health and a high degree of general comfort and convenience. Sometimes I think the public has a greater appreciation of the advantages of electricity than have the members of our industry. A well-planned campaign among our own employees is the first step in developing this tremendous latent market. "Complete electric service" would be a good slogan for 1928.

ALEX DOW

SO FAR as I can see, the first few months of 1928 will be months of continued caution. Thereafter the prospects are for steady improvement of business.

By Alex Dow,
*President The Detroit Edison Company*

## *Employees Are Company in the Public Eye*

By A. Emory Wishon

*Vice-President and General Manager San Joaquin Light & Power Corporation and the Great Western Power Company*

THE most valuable medium for promoting the understanding of the utility and its problems is the utility organization itself and with it the first educational work should be undertaken. Ours is not a business merely of the executives; every worker of the rank and file is a part of it, and to customers the meter reader, the service man and the girl behind the cashier's desk are "the power company," rather than the private office men whom they rarely if ever meet. Executives know the story that should be told the public: too often the rank-and-file workers do not know it. Yet each of them makes perhaps as many contacts as do the executives, and because of their number they are an infinitely greater force for publicity. They have opportunity to tell the utility's story in the most effective way it can be told—personally, to friends and acquaintances who know them and like and respect

A. E. WISHON

them. The manager wants the public to have friendly understanding. He depends upon his organization to promote it. His first and most important step toward informing the public, therefore, should be to inform his employees.

## *Farms Like Industry Benefit from Electricity*

By A. W. Leonard

*President Puget Sound Power & Light Company*

NO GREATER service can be rendered by the electrical utilities of the nation than to carry the conveniences and economy of electricity to the farms of America. Electrical utilities of the Pacific Northwest believe that electricity can do for agriculture what it has done for industry. Through intensive cultivation of electrical applications on the farm with a sympathetic understanding of the farmer's problems the Puget Sound Power & Light Company has developed a profitable rural load and at the same time has improved the enonomic status of the farmers of western Washington. During 1927 our company connected more than 5,000 additional rural customers to its lines, and already more than 75 per cent of all homes outside the corporate limits of cities and towns in this territory are enjoying the benefits of electric service. In this electrification program we feel that we are doing our modest part in fulfilling the obligations of the electrical industry to the American farmer and we shall continue to support its worthy purpose.

A. W. LEONARD

# Comment of Manufacturers

## *Sound and Steady Business Expected*

IN THE electrical machinery line there was a moderate decrease in business in the latter part of 1927 as compared with the first half of the year, but it would seem as though we can look forward to the year 1928 with a fair degree of confidence. There is every reason to believe that the requirements of public utility corporations will not decrease. New uses and applications of electricity are constantly being made. The condition of the financial market offers favorable opportunities to provide the capital for necessary extensions. On the whole, it would not appear that the present slackening in business will be of extended duration, and while its immediate effect may be to reduce output and in many cases profits, there would seem to be reason to expect sound and steady business throughout 1928.

Otto H. Falk,  
*President Allis-Chalmers Manufacturing Company.*

## *More Sales Predicted as Result of Surveys*

IN 1926, the year in which the supply department of the Western Electric Company changed its name to Graybar, we realized a total business of $77,000,000, which was by far the largest volume we had ever attained up to that time. Our business this year, while somewhat under that volume, will run close to it. We estimate that business in 1928 will be somewhat better than it has been during 1927, and we look forward to a very satisfactory volume from every standpoint. This estimate is given not as an optimistic guess but rather as a figure which is based on a very close survey of business conditions of the present and future from all parts of the country.

All our sales and expense budgets are based on these estimates, and in the many years since we have adopted this plan of budgeting sales and expense it is very seldom that our estimates and accomplishments vary very much. This survey and statement, therefore, should be of interest to business and financial men of the country who are looking into the future with questioning eyes. It is our belief, based on our estimates, that we need have no fear about the business outcome for the year to come.

A. L. Salt,  
*President Graybar Electric Company, Inc.*

## *Good Promise of Satisfactory Trade*

THE volume of sales for 1927 exceeded our expectations and was very satisfactory indeed. Further, I believe the year in all branches returned a bigger and better business than was generally predicted. The year 1928 gives good promise for a satisfactory volume of trade. I am saying that we look for continued good business, and as mass psychology is most potent, the more people saying that business is good the better the possibility of attaining good business. So let us bury any pessimistic feelings and cry aloud our faith in conditions for the coming year. In doing so we shall all help ourselves.

F. C. Hodkinson,  
*Vice-President and General Manager American Circular Loom Company.*

## *Prosperous Year Ahead for the Progressive*

THE steadily increasing business of utilities at an adequate profit will be favorably reflected in an increased amount of business placed with manufacturers, and if they in turn are well managed and produce good quality at a fair price, they will be rewarded by fair profit. The interests of the utilities and the manufacturers are mutual. One cannot succeed without the other and the most promising feature of today's business is that those who today are not willing to let each branch of the industry prosper represent a constantly diminishing minority. Basing my opinion on the combination of a fair-minded, prosperous utility group, coupled with a natural increasing demand of the public for more and more electric service, I feel the well-managed manufacturing companies, performing a useful function, can look forward to a prosperous 1928.

H. W. Young,  
*President Delta-Star Electric Company.*

## *Indicates Splendid Basic Condition*

A REVIEW of the electrical industry indicates a splendid basic condition which not only gives promise of a continuation of prosperity but also gives promise of a reasonable increase in the volume of electrical business during the year 1928. With many millions of wired homes which are as yet inadequately equipped with labor-saving and convenient electrical appliances, there is a continually broadening market for these devices. During the past year increased sales of all domestic appliances, with the exception of fans, have been recorded throughout the country. Adequate provision should be made for sufficient wiring in new buildings to permit the more liberal use of current-consuming devices.

During the past year there has been only a fair volume of business in the large generating and control apparatus used in the great public utility stations, probably owing to the larger individual units now being installed. The application of electric motors to all kinds of industrial needs has shown progress and has already reached very large dimensions. As this use is becoming almost universal, development of this field should continue at a rapid rate. Progress in the electrification of our railroads has been very much slower than was anticipated some months ago. A considerable increase in the volume of this business is looked for in the near future.

E. M. Herr,
*President Westinghouse Electric & Manufacturing Company.*

## *Good Prospects*

ALTHOUGH competition was exceedingly keen, our 1927 business was highly satisfactory. Barring some abnormal conditions, 1928 should be equally good.

S. A. Burnham,
*President Condit Electrical Manufacturing Corporation.*

## *Expect 1928 Will Be Better Than 1927*

OUR sales in 1927 slightly exceeded those of 1926, but the last half slowed up for two reasons—Ford's delay in getting out the new car and unseasonably warm weather. We expect 1928 to be better than 1927 for the same two causes, among others—Ford will be on the market and the auto trade humming, and second, the late fall helped the farmer, who will have more to spend. Other reasons for expecting 1928 to be a good business year include easy money, good employment at high wages and moderate inventories.

F. W. Jessop,
*President Ohio Electric & Controller Company.*

## *1928—A Buyers' Market With Price Reductions*

OUR 1927 business for eleven months shows a 3 per cent increase over a similar period for 1926. Resale prices average a 5 per cent reduction over 1926, so this figures substantially an 8 per cent increase in commodity sales in 1927 over 1926. The year 1928 will, in my opinion, be a "buyers' market," with price reductions which naturally meet these conditions. The rather general allowance of 5 per cent cash discounts covering invoices paid on the 10th proximo as compared with cash discounts of 2 per cent paid ten days from date of invoice is an unfortunate condition and is to my mind an indication of unsound business conditions which is not as yet reflected by the money market.

G. E. Palmer,
*President Palmer Electric & Manufacturing Company.*

## *Next Year to Equal 1927*

THE business volume in 1928 will be at least the equal of 1927 and possibly equal 1926. While our volume for the year 1927 was considerably greater than 1926, this is largely owing to the manufacture and distribution of new lines of product and not because business generally has been so good. Our business, which is an excellent barometer, does not indicate a "boom" year, as many have predicted. Money and credit conditions will probably remain easy for some months, but we believe will gradually stiffen. Foreign competition, especially in foreign markets, will be more apparent in 1928. Commodity prices have increased slightly, yet there are indications that we are in a gradual but definite declining commodity price cycle.

Living expenses are slowly but surely decreasing and eventually labor wages will follow. Considerable unemployment exists at the present time. Inventories are not large generally, but are large enough for any consumption that exists and we feel that those who claim that stocks must be replenished are not taking this fact into consideration, and also the gradual decline of purchasing power. Our business indicates that prices of raw materials and commodities are working toward a balanced condition—somewhere between 40 and 50 per cent above pre-war prices. The copper metal is a good illustration of this. It has been too low in price as compared with most raw materials. Other metals have been too high and out of balance and are declining in price. Agricultural products have been too low, but are working higher. The prices of most manufactured products have been too low as compared with the cost of raw material and labor. The balance, we believe, however, will be affected by reduction of costs rather than appreciable increase in prices.

E. B. Freeman,
*Vice-President B. F. Sturtevant Company.*

## *Outlook Encouraging*

BUSINESS in 1927 was slightly off in volume as compared with 1926. The outlook for 1928, in my opinion, is very encouraging. The conditions, as I see them, seem to point toward a larger volume of business, and while prices will be very competitive, yet I think the results for the year will be satisfactory.

W. C. Bryant,
*Chairman Bryant Electric Company.*

## *Outlook for Wire Is Fairly Good*

THE electrical wire and cable industry in 1927 has suffered from a somewhat reduced consumption and a highly competitive price situation. The outlook for 1928 business is fairly good and manufacturers should make a better showing than they have during 1927, provided a few of the manufacturers who have operated without reasonable profit in 1927 make a careful analysis of their actual manufacturing and selling costs and base their selling prices upon costs plus a reasonable profit rather than upon lowest competitive price as reported by the salesmen and probably made by some manufacturer without cost knowledge. Copper, rubber and yarn prices would indicate that present selling prices are exceedingly low and that as soon as business shows improvement in the coming year prices should show a reasonable advance.

H. T. Dyett,
*President Rome Wire Company.*

## *Better Sales and Profits Predicted*

BUSINESS was not quite so good in 1927 as it was in 1926. There was much left to be desired, particularly as regards the margin of profit, but business was in fair volume and we look forward to 1928 with a great deal of confidence. I do not believe there will be any particular boom, but we shall have a better year than 1927, and also a better margin of profit.

Louis Larsen,
*General Manager Sundh Electric Company, Inc.*

## *Market for Refrigerators Continually Expanding*

OUR 1927 experiences caused us to appreciate more fully than ever the permanent character of the demand for our products and demonstrate conclusively that 1928 and succeeding years will provide a continually expanding market for automatically operated electrical refrigeration.

A. H. Goss,
*Chairman of the Board Electric Refrigeration Corporation.*

## *Outlook Favorable*

THE outlook for 1928 is, on the whole, favorable. Economic conditions are sound and the satisfaction of the demand of 120,000,000 people should provide ample business activities, with the usual attendant improvement in the art. Earnings of labor have never been so high and with a continuance of good business these earnings should continue and employment become steadier. The electrical manufacturing business for 1927 has, on the whole, been satisfactory, and about the same in volume as the previous year. The use of electric current in homes and factories has increased 7 per cent over 1926, and with the exception of 1921 has shown an increase each year since 1919, when the index was first prepared, and the consumption in 1927 was more than double what it was in 1919. This is becoming one of the best indices of general and industrial conditions in America.

Gerard Swope,
*President General Electric Company.*

## *Sales Will Not Be Less Than in 1927*

OUR business in 1927, while satisfactory, has been slightly under 1926. The first six months showed better sales than the corresponding period of 1926. The third quarter showed a decided slump. We had a fairly good sale during the last quarter, but taken as a whole our total sales for the year will show slightly under last year. We feel that the outlook for 1928, so far as we can judge, is good, at any rate not less than this year. We do not, however, feel that 1928 will be quite so good a year for the electrical business as 1926.

R. C. Lanphier,
*President Sangamo Electric Company.*

## *No Change in Business, Improvement Probable*

IT IS my anticipation that no material change in the business conditions now prevailing will occur until the political situation and the crop situation for 1928 are more definitely determined. This may take the first half of the year. After that, assuming no unfavorable developments in either the political or the crop situations, I look for improvement.

B. Worden,
*President Cutler-Hammer Manufacturing Company.*

## *Business Activity Will Continue*

THE increased volume of business, generally expected by electrical manufacturers for 1927, was reduced, no doubt, on account of the mid-year readjustments of budgets by public utilities and industrials. However, the electrical industry appears to have enjoyed during 1927 a business volume about equal to that of 1926—the industry's greatest previous business year. Indications at this time point to a continuance of the present rate of business activity during the first half of 1928.

N. J. Conrad,
*General Manager Schweitzer & Conrad, Inc.*

## *Stable Market Looked For in 1928*

IN 1927 the volume of business was slightly less than for 1926 and profits were not as satisfactory, owing principally to the unstable market conditions and great caution used by buyers during the last quarter of the year. These same facts obtained in most of the primary industries—that is, low profits and unsatisfactory volume. In the electrical industry the prices of apparatus are lower in proportion to costs than most any other manufactured article. This makes for keen competition and low profits. We look forward to the year 1928 with assurance. We believe prices will be better and volume substantially larger, and we believe in our industry the market will be more stable than it has been during the past two years.

Edmund Lang,
*President Crocker-Wheeler Electric Manufacturing Company.*

## *Fair Demand for Poles Expected*

OUR analysis of business conditions as it pertains to the pole industry is that 1927, from a standpoint of volume, has produced the largest pole business in the history of the industry, but with somewhat of an unsatisfactory price situation, especially for the last six months of the year. For 1928 we are looking for a fair demand, with some shrinkage from that of 1927. There will not be quite as much transmission line building in 1928, but the demand will be equally as heavy for distribution lines.

L. L. Hill.
*President Page & Hill Company.*

## *Large Volume Can be Created in 1928*

WHILE I do not look for business secured during 1928 to equal that which might be the result of a boom period, I now entertain the opinion that business will be good during 1928 for those who will make a definite effort not only to secure their share but to create business where there are so many opportunities existing. Even should the new move to develop the market not get well under way during the next year, There will be a sufficient inspiration so the industry will witness substantial gains in 1928.

R. J. Russell,
*Vice-President and Secretary Century Electric Company.*

## *Profits Discouraging but Prospects Bright*

THE volume of business in 1927 was very satisfactory, but from a profit standpoint it was a most discouraging year. Competition was very severe and apparently it was a "buyers' market" and full advantage was taken of this condition when purchasing materials. Prospects for 1928 do not indicate much change over 1927. This will mean that to make a reasonable profit it will be necessary to increase greatly the efficiency and output per man unless better prices can be secured.

L. R. Lewis,
*President Electric Power Equipment Corporation.*

## *Confidence in 1928*

THE year 1927 has been a good year. The prospects for 1928 are equally good. If business has been a little "off" in some quarters, as it has been in the appliance field, it merely indicates a little fluctuation in the wavy line of business trend, the general level of which continues well above the poor business zone. If, as a result of present trends, we have to manufacture and merchandise more efficiently in order to stay in the race, that will be good both for business and the country. We can look forward to 1928 with confidence. The electrical industry should push forward with enthusiasm. It needs sustained enthusiasm directed by merchandising wisdom. For that industry, the outlook is bright.

G. A. Hughes,
*President Edison Electric Appliance Company, Inc.*

## *Improvement Expected in Business Policies*

THE year 1927 should be a warning to all manufacturers that while declining prices and profits go there must be a limit. The past year should have been a more prosperous one, considering the volume of business. There are some indications in the air that 1928 will not be a repetition of 1927. Many manufacturers are beginning to realize that "mass production" is an economic fact and not a slogan. Like everything else, it can be carried too far

F. R. Fishback,
*President Electric Controller & Manufacturing Company.*

## *Increase Expected*

THE year 1927 showed a very healthy increase in our gross business; in amount, approximately 20 per cent. Prices are very much more satisfactory than previously and on the whole we are thoroughly satisfied with our business for the past year. Every indication points to the same increase in 1928, and the number of pending negotiations indicate that this business will be placed earlier than in the past, so that our customary low spot in production during the first quarter of the year will be to a larger extent filled out.

B. W. Kerr,
*President Railway & Industrial Engineering Company.*

## *Better Year Anticipated*

IT HAS been the almost uniform experience of manufacturers supplying the power plant field that the volume of business for 1927 was not quite so good as that which was experienced in 1926. The falling off in volume, however, has been relatively slight and on the whole 1927 has been what might be called a normal or average year. Competition has been very keen and in some cases destructive. It looks as though 1928 would be better than the year just closed.

Money rates are low, basic commodity prices are down and inventories of every sort are at a low figure due to more careful buying and accurate control of stocks. All factors seem to point to a fine business year.

F. H. Daniels,
*President Riley Stoker Corporation.*

## Improvement Anticipated

THE electrical motor business for 1927 has been much disturbed by changes in sales policy by all of the motor manufacturers and the adoption of a system of discounts for different classes of customers, which has required considerable time on the part of the customers to digest. The new methods are now becoming well understood and complications are disappearing. These factors should lead to a considerable improvement in the business for the year 1928.

James Burke,
*President Burke Electric Company.*

## Expresses Confidence in 1928 Business

WE ARE looking forward with confidence to as good if not better business in 1928 than in the current year. Manufacturers devoting their efforts to quality products and rendering a prompt service should reap an increased business in the next twelve months.

L. G. Kuhlman,
*Treasurer and General Manager*
*Wadsworth Electric Manufacturing Company, Inc.*

## Cross-Arm Sales Will Be in Good Volume

WE CANNOT see much difference between the business of the present time and that of one year ago. The indications as we see them are for sufficient volume during the coming year, but prices are not what they should be for the volume of business handled. The price of fir cross-arms is generally governed by the price of fir lumber. However, the building program indicates an increase and if this actually develops, then we look for somewhat better prices for cross-arms than have prevailed during the present year, which have been on a minimum basis.

B. F. Vreeland,
*President Douglas Fir Cross-Arm Company.*

## Prosperity Dependent on Ourselves

I AM NOT a statistician and know only what the financial agencies tell me—that 1928 will be better than 1927, which was pretty fair, that building will increase, which will help. But I can't get it out of my head that although an increase in general business will react to the advantage of the electrical industry, nevertheless the real extent of our prosperity is dependent upon ourselves. The people of this country have plenty of money. Whether or not they change their habits and give the electrical industry its fair share of what they spend is up to us. They won't do it unless we pound home the electrical idea. So, as far as our prosperity is concerned, we can write our own ticket for 1928.

W. E. Sprackling,
*President Tubular Woven Fabric Company.*

## No Reason to Expect a Falling Off

WHILE naturally data for 1927 are not complete, the business of our company for the past year has run very close to that of 1926. While it will probably be found to be slightly below 1926 business, this falling off will not amount to more than 4 per cent, and as 1926 was by far the best year since the war, we feel that 1927 has been entirely satisfactory. As to the coming year, we see no reason for expecting a decided falling off, although probably there will not be much improvement. In other words, we expect 1928 to be about in line with 1927.

C. R. Durling,
*President Monitor Controller Company.*

## Better Business but Low Profits

GENERAL business in 1928 will be better than in 1927. There is a slight tendency toward increasing prices in raw materials which will counteract the otherwise gradually lowering cost of manufacture, the result probably being a stabilization of price, with a comparatively low margin of profit on standardized articles.

C. H. Roth,
*President Roth Brothers & Company.*

## Indications Good for Early 1928

IT IS a very difficult problem to give you our outlook on the prospects for business for 1928, and it must of necessity be more or less of a guess, but our business has been increasing in volume for the last six weeks and indications for the early part of 1928 seem especially good. We are planning for a considerable increase in volume over 1927.

J. A. Johnson,
*Secretary-Treasurer Kuhlman Electric Co.*

## Keener Competition Is Forecast

THE competitive conditions of 1927 have stimulated manufacturers to improve their product and reduce costs, with the result that those who have been able to do so have maintained a substantial volume and a reasonable margin of profit. The same conditions for 1928 will undoubtedly prevail, with even keener competition and narrower margins, in my opinion. This is not altogether unhealthy, for it puts a premium on ability and a penalty on inefficiency, which is an old law. We must get used to a reasonable volume and make profits by closer attention to business.

H. G. Steele,
*President U. S. Electrical Manufacturing Company.*

## 1927 Corn Crop Encouraging

THE effect of the large 1927 corn crop in the Southwest constitutes the most encouraging factor in current business and in the outlook for the early part of next year. Business for the current year in volume measures up very closely to 1926.

F. M. Bernardin,
*Chairman of the Board*
*Mid-West General Electric Supply Company.*

## Keen Competition but Satisfactory Business

WE LOOK for generally satisfactory business in the coming year, comparable to that we have had over the past two years. Competition is, of course, keen and there is every inducement for more efficient methods in production and distribution.

J. M. Taylor,
*President Diamond State Fibre Company.*

## Expects Larger Volume

THE portion of our business done with the electrical trade was not so good in 1927 as in 1926. The fiscal volume was about 15 per cent less and the price levels about 10 per cent lower, which taken together produced an unsatisfactory result. We have a feeling that 1928 will show a considerable improvement in volume, since we believe the large utilities will soon come into the market with heavier specifications.

N. A. Wolcott,
*President Packard Electric Company.*

## Can Expect Continued Prosperity

WE SEE no reason to expect anything but continued prosperity in the new year for the electrical business in all its activities. We are closing our banner year. The demand for lighting equipment, designed and built with the quality idea, always in mind, continues unabated from all directions.

Augustus D. Curtis,
*President Curtis Lighting, Inc.*

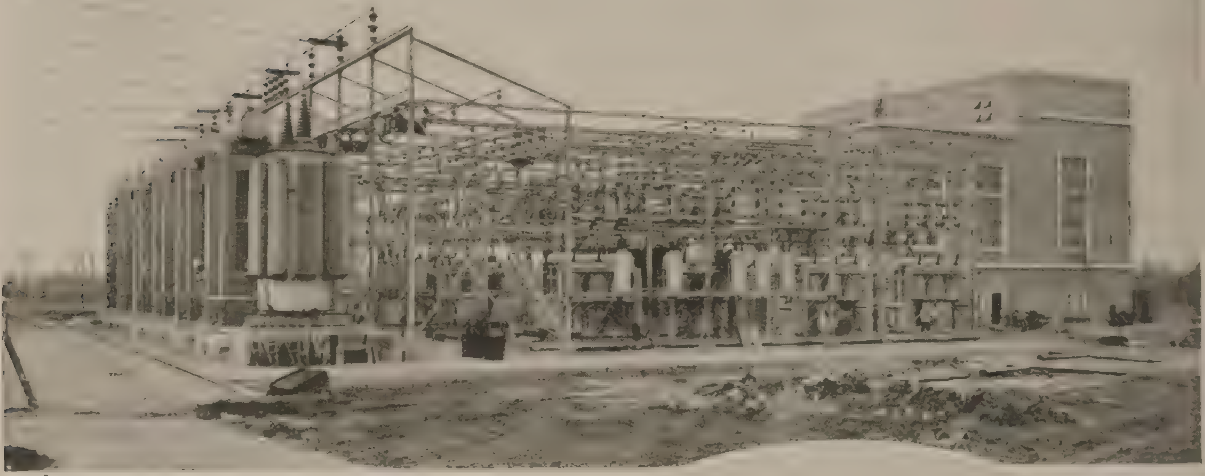
## Prosperity Depends on Disposal of Problems

THE sooner we tackle and dispose of certain industry problems, prominent among them being the grounding problem, the greater will be the prosperity of the electrical industry in 1928 and every year thereafter.

D. H. Murphy,
*President Wiremold Company.*

# Substations of 1927

## Notable Either for Construction or Purpose Used



At top — Walpole, Mass., 110-kv. substation of the Edison Electric Illuminating Company of Boston, containing two 110/14-kv., 15,000-kva. transformers which will ultimately be attached to a transmission ring which has already been built from Edgar station through important centers to the south and west.

At bottom—Jackson 110-kv. substation of the Mississippi Power & Light Co.

In center—Trenton 132-kv. switching station, which connects the New Jersey Electric & Gas Company with the Philadelphia Electric Company.

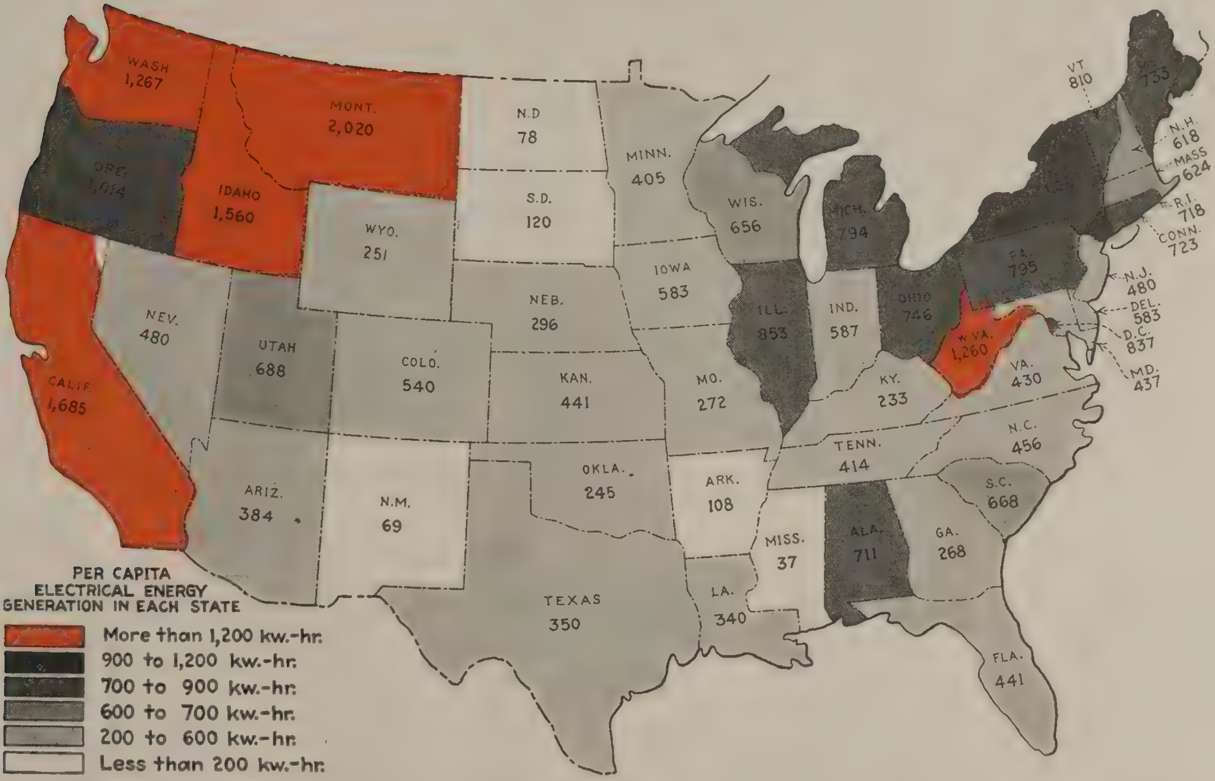
In oval—East Point substation of the Georgia Power Company, tied with Georgia and Alabama system by four 110-kv. lines and with Macon by two 60-kv. lines.

# Light and Power Progress

Serves 21,700,000 customers for a gross revenue of $1,783,000,000. Generation aggregates 75,100,000,000 kw.-hr. Serves 16,000,000 hp. in factories. Résumé of operations

By G. F. Wittig

*Statistical Editor*



THE YEAR 1927 has witnessed a normal growth and development in the light and power industry. Its operations continue to expand, its service continues to supply an increasing demand and its management continues to develop better ways of doing business.

The 4,400 operating properties supply electricity to 21,700,000 customers in the United States. For this service they receive a gross revenue of $1,783,000,000. Operating and maintenance expenses used $767,000,000 of the revenue, taxes to local, state and national governments accounted for a sum estimated to be $150,000,000, and the balance of the revenue took care of incidentals, development expense, depreciation and obsolescence, and the credit requirements of an industry group whose operating and holding company capitalization aggregates $9,500,000,000. In 1927 the light and power utilities raised more than $2,100,000,000 in the money markets which they used for refunding high-rate issues and for additions to service facilities. Of this sum, $240,000,000 was raised by direct sales of securities to customers and employees in 344,000 individual sales. The capital expenditures for these properties aggregated $760,000,000 in 1927, and the budget for 1928 amounts to $900,000,000.

In their normal operations the light and power companies generated 75,100,000,000 kw.-hr., of which 29,000,000,000 kw.-hr. came from waterpower plants and 46,100,000,000 kw.-hr. from fuel-burning stations. The generating capacity of the industry aggregates 29,000,000 kva.; of the prime movers water power operates 11,700,000 hp. This power supplied nearly 16,000,000 of the 35,800,000 hp. driving our factories, to quote 1925 census figures, and it gave to the cities and homes the services and conveniences which only electricity can render.

### Economy Due to Management

But along with these results, many developments occurred in the industry which were of fundamental importance to industry growth. Executives are trying to sell more service. They are attempting to use mass production and consolidated management, to reduce costs so that more and better service may be rendered for the same money. As a consequence, mergers and corporate changes occurred which were more than 800 in number, generating station efficiencies were improved through the display of engineering talent, the cost of money was

† Based on ten months' operation.

reduced by the use of low-rate money incidental to better utility credit, and operating methods were reorganized to lower costs of doing business. All these developments displayed the initiative and intelligence of industry leaders and lie behind the cold statistical figures, which measure industry progress.

Statistics are of little value unless defined and interpreted. Each user will draw his own inferences regarding details, and only trends need be discussed. One theme runs through all the compilations, and that is the fact that electrical energy, generated in large stations and distributed over wide areas, is being used in increasing amount in the homes, in industry and in the other pursuits incidental to modern civilization. This electrical energy is being produced with progressively higher efficiency, and is sold at a decreasing unit price.

Without attempting to penetrate the remote future, it seems evident that for as long a period as need be considered, in a practical way, the demand for electric service will continue and the turn toward saturation, when it comes, will be very gradual. That rise is predicated upon

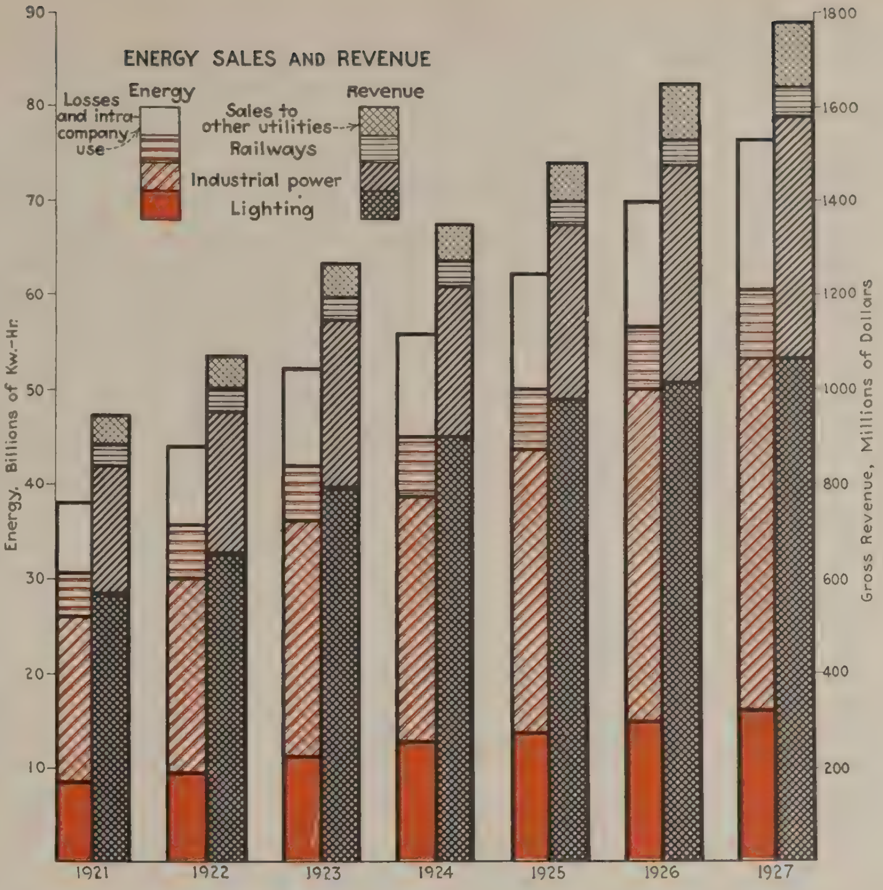
something more substantial than the upward sweep of a curve on a chart. The fundamental difference between life in the twentieth century and in former ages is the general use of mechanical in place of human or animal power. This, probably more than any other one factor, has served to create the wealth that nurtured the other contributions to our well-being and comfort.

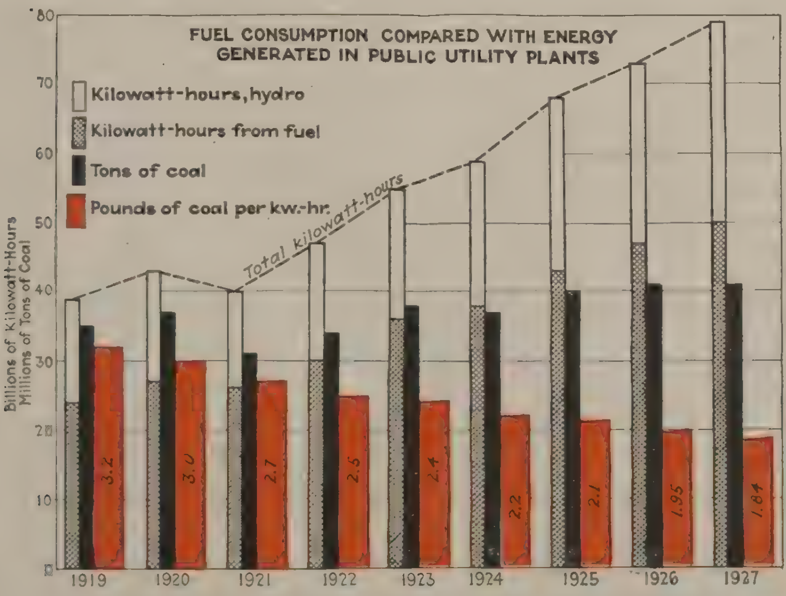
### Electricity Aids Industry

The most convenient and versatile agency thus far discovered for the transmission and application of that mechanical energy is the electrical system. The statement is made in no disparagement or lack of recognition of non-electrical uses of power. The tractor-hauled gang plow and the garden spade each has its place in tilling the soil. Electrical methods will supplant non-electrical wherever they fill a real need and their advantages are adequately presented. On these basic considerations rests the future advance of the electrical industry.



LIGHTING ACCOUNTS FOR $1,100,000,000 OF GROSS REVENUE

Since 1921, the generation of energy in public utility plants has increased at an average rate of nearly 7,000,000,000 kw.-hr. annually. To provide the machinery for generating that increase calls, each year, for a net addition of 2,500,000 to 3,000,000 kva. with the necessary prime movers, plus replacement for what has become obsolete. To send out and apply the added 7,000,000,000 kw.-hr. necessitates transmission and distribution equipment and energy-converting devices with their accessories. To buy and install the power companies' part of all this material calls for about $800,000,000 to $900,000,000, in capital investment annually.



LESS COAL IS USED PER KILOWATT-HOUR EACH YEAR, GIVING DOUBLE THE ENERGY WITH ONE-SIXTH MORE FUEL

Compared with 1926, business in 1927 was slower in the electric as in other industries. But, whereas in many of the others this signifies a recession in operations and in earnings, in the electric power industry it means something very different. The earnings in 1927 were greater than in the year before by more than $131,000,000, or 8 per cent, and the output was greater by 6,000,000,000 kw.-hr., nearly 9 per cent increase. Only the increase, not the operations themselves, was less than in 1926, which showed $168,000,000 rise in the revenue and 8,000,000,000 kw.-hr. increase in energy generated over the preceding year's operations.

It has been suggested that 1928 may show a decline in new construction. The indications are contrary to that view. The summary of prospective budgets, based this year on an exceptionally full response to requests for that information, is higher than

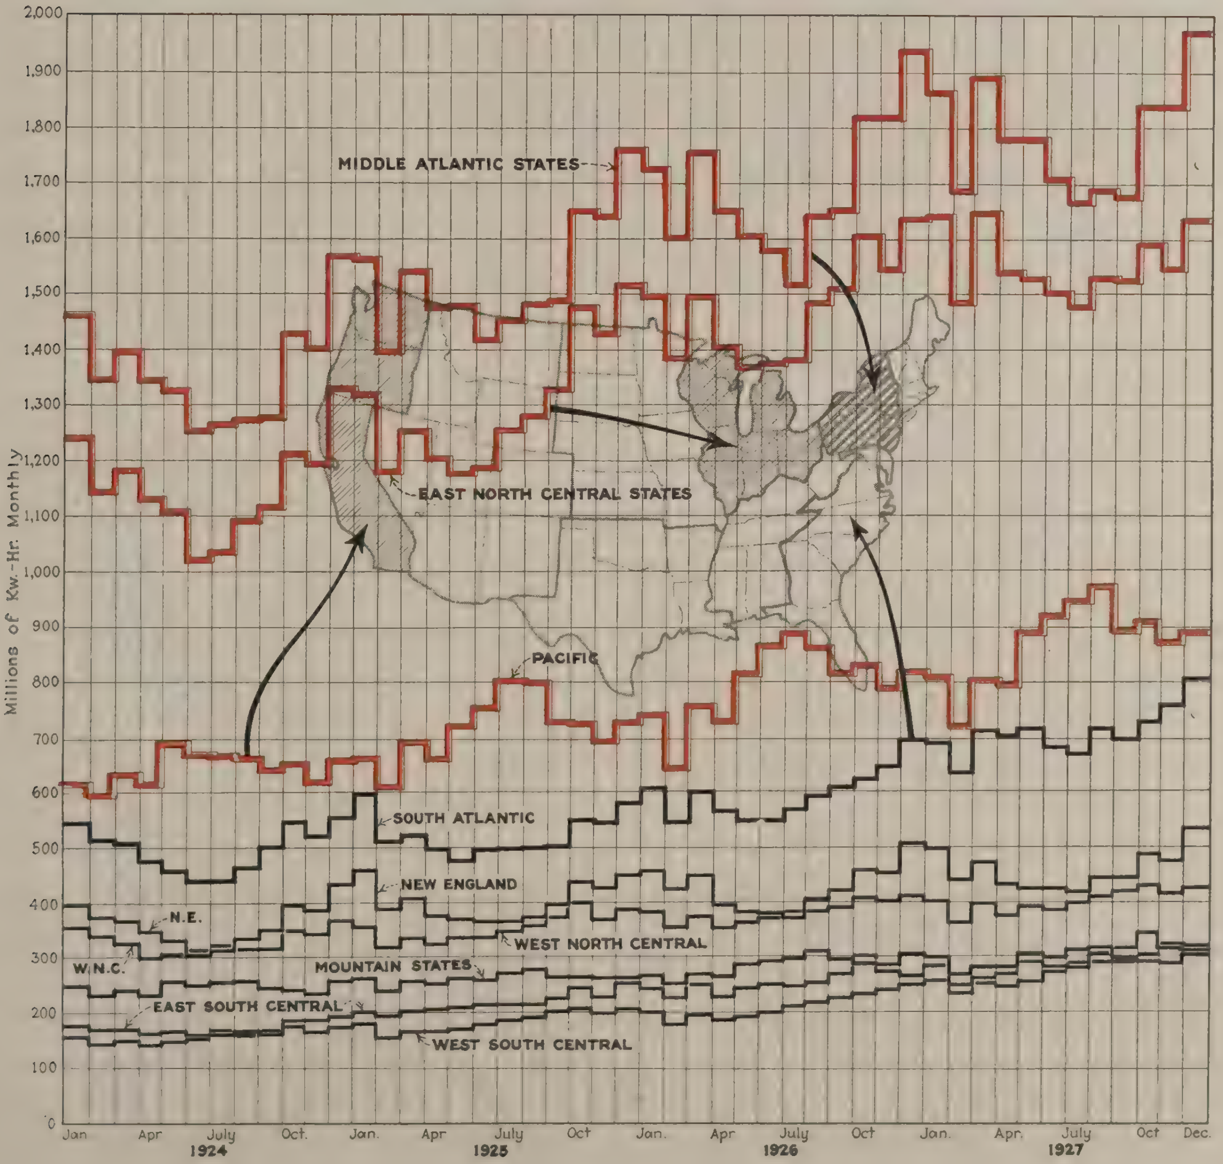
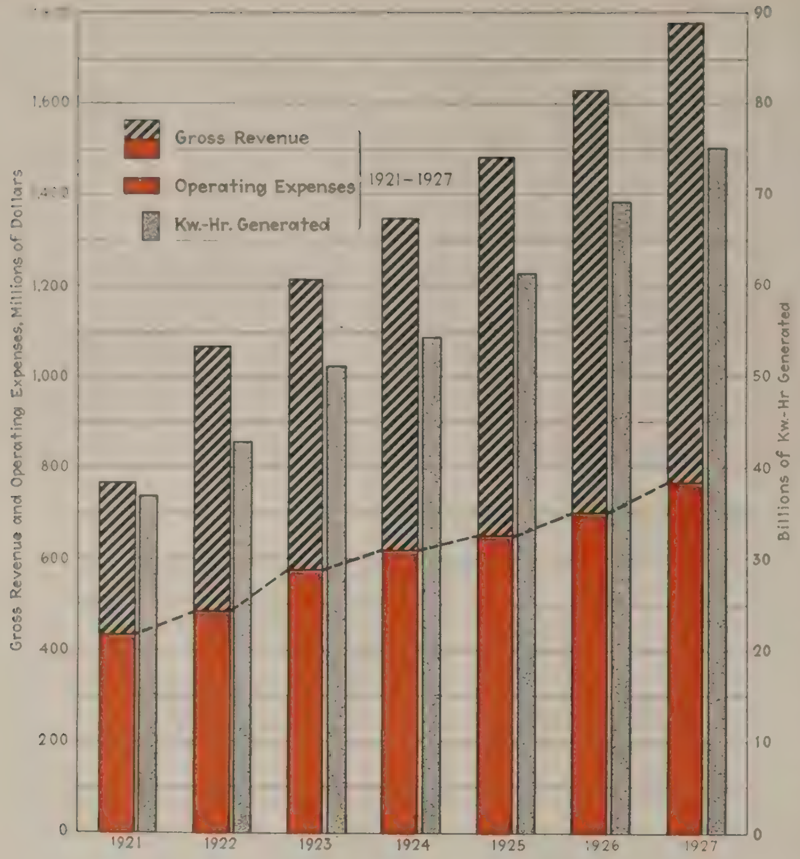
ENERGY GENERATED MONTHLY





ANNUAL INCREASE FOR FIVE YEARS AVERAGES MORE THAN $140,000,000 IN REVENUE AND 6,500,000,000 KW.-HR. IN OUTPUT

the expenditures for any previous year and exceeds any previous budget estimate, except that for 1927. The latter was made at the end of two years of unusual growth. There seemed need of an accelerated pace in providing new plant, and the estimated expenditures were correspondingly high; later developments justified a more conservative policy. The contrary condition exists at the beginning of 1928. The natural tendency is toward moderation in the estimates but the work deferred from 1927 must be made up, and the industry continues to grow.

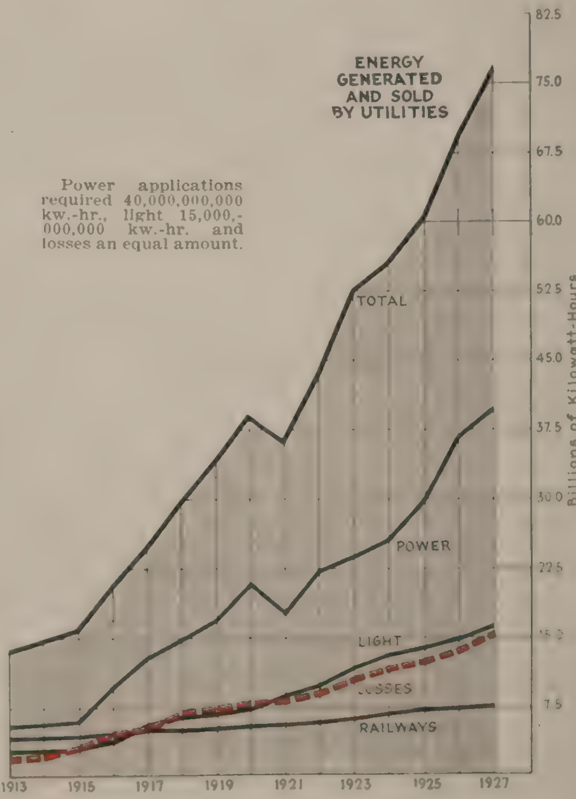
Whatever excess capacity may be indicated by a slightly smaller output per kva. shown in certain reports for 1927, compared with 1926, is at most temporary. Even 1,000,000 kva. represents only a few months' growth, and programs for new plant must be made not for months but years. Undue curtailment would surely result in embarrassment before the deficiency could be overcome.

### Interconnection and Energy Production

The increasing sale of energy between operating companies reflects the effect of interconnections. In amount it constitutes a fifth of the total generated. It has doubled in four years. In 1923 it was about 7,400,000,000 kw.-hr. It rose in successive years by 12, 17, 36 and 12 per cent respectively. In 1927 it reached 14,700,000,000 kw.-hr.

The combined influence of improved utilization of fuel in the modern station, of the complementary use of hydro and steam power, and of the growing network of high-tension lines permitting the most advantageous allocation of loads in a wide area, is made evident by the decrease from 3.2 to 1.85 lb. of coal per kw.-hr. since 1919. The difference is equivalent to a saving, in 1927 alone, in all public utility plants in the United States, of 34,000,000 tons of coal; in the last eight years, the cumulative savings aggregate nearly 140,000,000 tons.

The utilities embody, not only individual savings by far more than a million customer security holders, but the savings of countless others through insurance companies and other forms of trusteeship, the accumulated excess of production over consumption. Those savings are devoted to greater productivity, to the easing of human effort and the providing of comforts. This should not signify merely more material possessions, wider scope for idleness and competitive ostentation; it should carry with it a wholesome growth of those enduring values generally recognized as constituents of a higher civilization, emerging from the initial exhilaration of mere acquisition. There is reason to believe that these things are gradually coming to pass, and that the increasing application of the sources of power in nature, through electrical means, for the benefit and convenience of mankind is a significant factor in a continuing process.



Power applications required 40,000,000,000 kw.-hr., light 15,000,000,000 kw.-hr. and losses an equal amount.

# Twelve Months in Retrospect

Technical triumphs, building, installation and interconnection went steadily on. Despite water-power controversies, politics and floods, 1927 proved full of encouragement

ELECTRICAL engineering achievements of a sufficiently novel character to figure as news of the industry in 1927 were recalled in the ELECTRICAL WORLD for Dec. 3. In the light and power field they included the installation or placing on order of a quantity of equipment of various sorts which in one particular or another was of unprecedented rating and the coming into service almost simultaneously in Chicago and New York of 132-kv. underground cable of Pirelli type. In the allied field of communication television sprang into being and transatlantic telephony became a commercial reality.

Though such engineering advances were fundamentally the most important industry news in the last twelve months, political complications were by their nature the most discussed events and those to which most heed was given by the general public. When the year opened discussions over the disposition of the government property at Muscle Shoals and the proper solution of the triple problem of the Colorado basin—flood prevention, irrigation and generation—were filling many pages in the *Congressional Record* and many columns of the newspapers.

### DEBATE AD INFINITUM

Nineteen-twenty-seven has given way to 1928, the Sixty-ninth Congress has been succeeded by the Seventieth, seven Western governors have met in solemn conclave, disputed and gone home, but the same discussions wax warm again and the identical arguments pro and con are iterated and reiterated in the Capitol lobbies and will soon resound in the upper and lower chambers. If every word spoken on Muscle Shoals were a kilowatt-hour, power from the Tennessee would drug the Southern market. If every oratorical gesture anent Boulder Dam were the upward motion of a piston in an irrigation pump, the deserts of Arizona and Nevada would blossom like the fertilized regions in the Imperial Valley.

Discussion is a dearly bought prerogative of democracy, and it is better that the people through their chosen representatives should reach their own slow decisions on matters inextricably tied in with statecraft and politics than that aspersion should becloud the policies that industrial experts might enforce were the sole responsibility theirs. None the less, it is impossible not to contrast the inertia on the government-embargoed streams with the activity at Conowingo, from which 1928 will in all probability see energy transmitted, and with the beginning already made on the Saluda River in South Carolina. From these two privately owned water-power sites, which figured conspicuously in last year's news and which rival Wilson Dam in potential power, it is safe to predict that industry will receive a great accession of energy long before Muscle Shoals is properly put to work, to say nothing of the eleven sites on the upper reaches of the Tennessee. On the Falls of the Ohio in Kentucky, on the Tallapoosa and Coosa Rivers in Alabama, on Lake Chelan in Washington State, large privately owned hydro plants are rapidly being built. Others of a good size are under way in various states. In both northern and southern California the continuous performance of the largest two companies of that state has maintained its momentum. In July the Melones plant of the Pacific Gas & Electric Company, which is built at an irrigation dam, was dedicated, and November saw the completion of the Mono Bear diversion channel of the Southern California Edison.

### STATE LAW AND REGULATION

Water power continued in 1927 to play a part in state legislatures as well as at Washington. Maine's lawmakers began to realize that, after all, the exportation of power might be a source of gain and not loss to that commonwealth, though no definite step was taken to repeal the law forbidding hydro power to be sent across the boundary. New York argued St. Lawrence development all over again, the Governor failing to convert the Legislature to his views and the Legislature failing to concoct a bill the Governor would sign. West Virginia's legislators left the water powers of that commonwealth where they found them—mainly unused. Wisconsin adopted a policy differing in its recapture provision from the federal water-power law and was at once plunged into litigation over it, the state winning the victory. North and South Dakota officials presented grandiose plans for the Missouri, and in still other states water power played its part on the legislative stage.

The state regulating commissions survived attacks in several legislatures, the assault in Indiana being perhaps the most determined. Chicago defeated a "home rule" bill at the polls, and measures designed to encourage public ownership plans on the Pacific Coast were beaten in San Francisco, Sacramento and Los Angeles.

Many indications point to a fresh struggle in the commissions between opposed valuation methods—"historic cost" and "prudent investment" being again lined up against "reproduction cost new less depreciation." Bugles for battle have been blown in Massachusetts, repeated in Wisconsin and Ohio and echoed from California. The awaited decision in the suit of the St. Louis & O'Fallon Railway against the Interstate Commerce Commission was handed down by a United States court in December. But apparently it settles nothing, and all that has so far been made certain by the Supreme Court of the United States is that the first two methods or either of them cannot be adopted to total exclusion of the third.

### SENATOR WALSH'S RESOLUTION

But the prospective incursion that has aroused the most interest throughout electrical circles is that for which the way has just been paved by the resolution reintroduced at Washington by Senator Walsh of Montana to appoint a committee of five senators to investigate the electric light and power industry and the gas industry. Sent to committee before Christmas by a majority of four votes, the resolution is not likely to be buried there. The utility companies and the recently rejuvenated Joint Committee of National Utility Associations will almost surely have the opportunity to establish the honorable character and public benefit of such companies and to absolve in the public eye the great majority of them from connivance in the wiles of stock jobbers, speculators and promoters. Early in the year the industry came out unscathed from the investigation with similar objects conducted by the Federal Trade Commission.

### GROWTH OF THE SYSTEMS

Water may run idly to the sea without turning a wheel or generating a kilowatt, but steam once created is always put to use, and 1927 saw steam challenge water power in the latter's own territory—in California, in North Carolina and in Alabama, for instance, where respectively fuel-fired stations of the Southern California Edison Company, the Southern Power Company and the Alabama Power Company, built, building or prepared for, figured in last year's news. The coming steam plants of the Insull companies at Pekin, Ill., and elsewhere; new generating units now installed at Pittsburgh, Buffalo, New Orleans, Norfolk, Scranton, Pa.; Springfield, Ohio; Inglis, Fla., and many other places, and a large projected plant on the Delaware opposite Wilmington, Del., formed the subject matter of items in the weekly chronicle.

Texas, with its ever-growing oil production, was the broad theater of incessant building of moderate-sized and small generating plants at strategic points to feed long interconnecting lines. Oklahoma was another especially active state. Transmission lines continued to spring up all over the country, and the now universally accepted policy of interconnection received steady impetus. Because of the completion of links in North Carolina, Tennessee and the Virginias, unbroken interconnection was set up from Chicago south to Mobile and Pensacola. It had previously existed east to Boston, and both of the long right-angled copper arms were successfully operated in parallel, though no power was actually transmitted. The three-company 220-volt tie-in of the Public Service Electric & Gas Company of New Jersey, the Philadelphia Electric Company and the Pennsylvania Power & Light Company was, however, the most important new piece of interconnection to get under way, and it will provide an immense reservoir of power for the north Atlantic seaboard.

In Quebec Province a notable piece of work was finished—the 136-mile, 187-kv. line from the hydro development at Ile Maligne to the city of Quebec. From Canada at large, with her whole industrial structure built up on water power, have come constant reports of the clamor for more. The new Gatineau Power Company took rank at a bound with the great private companies on the continent, and from its plants near Ottawa are soon to be built two lines to serve the Ontario Hydro-Electric Power system—one to eastern Ontario points and one all the way to Toronto. Canada has its own water-power problems, and last year's reports showed that conflict between the provinces and the Dominion over jurisdiction on the Ottawa and St. Lawrence Rivers is waged quite as vigorously as any parallel contest between a state and the federal officials at Washington.

Consolidations, mergers and purchases were probably as numerous in 1927 as they were in 1926 and included at least seven actual changes of financial control affecting large groups of operating companies, among them the taking over of the Fitkin companies by Insull and of three Byllesby companies in California by the Pacific Gas & Electric, the union of seven up-state New York properties, and of the two competing Indianapolis companies, and the consolidation of the Philadelphia Electric with the United Gas Improvement Company. The transactions of the year are listed at length on pages 46 to 54 of this issue.

Rural service, if not forging forward at express speed, may be said, in a sense almost literal, to be striding in seven-league boots. Nebraska, Indiana, Wisconsin, Texas, Georgia, New York and Washington are some of the states from which encouraging reports came.

Besides the always fruitful and successful annual conventions of the National Electric Light Association and the American Institute of Electrical Engineers, several other gatherings of especially interesting character were held in 1927. The Southern Appalachian Power Conference met at Chattanooga in October, and the status of electrical development in the Southern States was well canvassed from many points of view. In the same month the National Association of Railroad and Utilities Commissioners assembled at Dallas. Its most interesting discussion concerned the holding companies. Confidence in conservative, old-time companies of this type was generally expressed, but the speculative, financially weak and overpyramided concerns were the occasion of some emphatic headshaking.

The National Electrical Manufacturers Association held its first annual meeting in June and hit its stride for growth and performance; the Electrical Supply Jobbers Association and the Society for Electrical Development were reorganized for better and completer service, and for the first time in the history of the industry its four major associations—of central-station men, manufacturers, jobbers and contractors—united through their respective heads in a communication to the industry at large designed especially to further commercial progress through closer co-operation.

Another interesting meeting was that of the International Electrotechnical Commission in Italy, at Bellagio and Rome, when the way was paved for the advancement of international standardization and the centenary of Volta's death was commemorated. An occasion of world-wide human interest was the attainment by Thomas A. Edison in February of his eightieth birthday amid universal acclaim.

### FLOODS AND DEATHS

The year, on the whole one of uninterrupted progress, had its leaden lining in the spring flood disasters on the Mississippi and its tributaries and their fall counterpart in Vermont and New Hampshire and in spots elsewhere in New England and in New York. The story of how in both the Southwestern and the Northeastern territory the operating companies maintained service amid discouraging conditions and lived up to the best traditions of light and power production has been duly told.

Death hit the manufacturing branch of the industry hard in removing such men as Guy E. Tripp, chairman of the board of the Westinghouse Electric & Manufacturing Company; Anson W. Burchard, vice-chairman of the General Electric Company's board and chairman of the International General Electric's directors, and Harvey Hubbell. Sigmund Bergmann, the German manufacturer whose early career in America helped him to a great measure of success in his native land, also ceased his labors in the year just past. Among many others mourned by the fraternity were Wigginton E. Creed, president of the Pacific Gas & Electric Company; B. C. Edgar, vice-president and general manager of the Tennessee Electric Power Company, and Admiral W. H. G. Bullard, head of the Federal Radio Commission set up by Congress a few months before his death.

# Telephone Developments—1927

International extension of communication facilities afforded by transatlantic telephony, lines to Mexico, and broadcasting networks. Toll rates reduced. Telephotography and television available. Permalloy helps equipment developments

CLEVELAND OFFICE OF OHIO BELL TELEPHONE COMPANY

AT THE end of 1927, 51 years after the invention of the telephone and 50 years from the installation of the first commercial telephone lines, there are in the United States more than 18,500,000 telephones. To connect these telephones to central offices and to provide for the interconnection of more than 70,000 cities, towns and villages throughout the country, there is a total of more than 63,000,000 miles of exchange and toll wire. Over this network an average of more than 72,000,000 local and toll conversations takes place daily. The growth in number of telephones in 1927 is shown in the accompanying table.

Telephony is distinctively an American art, the principal technical contributions to its improvement having taken place in this country. The intensive commercial development of the telephone in the United States is indicated by the fact that with 6 per cent of the world's population, the United States has about 60 per cent of the world's telephones. Progress in 1927 has taken place not only in the increase in number of telephones and in plant, but in the use made of present facilities and in improvements in the quality of telephone service throughout the country. Furthermore, the range of telephone communication has been increased by extensions to other countries, and important contributions to the future progress of the telephone art have been made. In many items, new ways have been found of reducing cost and improving efficiency, both as regards the elements which go to make up the complex telephone plant and the methods and practices employed in the operation thereof.

With regard to expenditures for new plant in 1927, figures covering the entire telephone industry in the United States are not yet available. It can be said, however, that total expenditures for new plant in the Bell system for 1927 are expected to reach $390,000,000, as compared with $380,000,000 in 1926, which will increase the system's facilities in taking care of additional business and for keeping the facilities of the system at the highest standard. Part of this is for new plant to replace plant retired because of obsolescence, changes to meet requirements of the public, inadequacy, on account of its being worn out or because of destruction by storms or floods. For

1926 the plant so replaced cost $122,000,000. The investment in plant and equipment in the Bell system devoted to furnishing telephone service at the beginning of 1928 amounts to more than $3,000,000,000.

As of Sept. 30, 1927, the number of employees of telephone companies in the United States was about 378,000. In addition, upwards of 50,000 were employed in telephone manufacturing and many more in the production of the raw materials required.

### Telephone Buildings

The need for a large building program to house telephone equipment and the operating and administrative forces is an indication of the rapid growth of the telephone business. Noteworthy among the telephone buildings recently opened for occupancy is the new building of the Ohio Bell Telephone Company in Cleveland, Ohio, opened in July, 1927. An illustration of this building appears on page 27. This building is 22 stories high and contains about 333,000 sq.ft. of floor space, and houses, in addition to administrative offices and dial central office equipment having capacity to serve about 47,000 stations. Space is provided for the necessary equipment and switchboards to take care of the toll and long distance services. Ultimately, the building can, if necessary be arranged to provide space for dial equipment for, perhaps, 200,000 stations. Another important building recently erected is the new 32-story building of the New York Telephone Company, the first ten stories of which, each having an area equivalent to an entire block, are designed for telephone equipment, and are capable, if desired, of housing dial equipment sufficient to provide for approximately 200,000 telephone stations. In this class should be mentioned the administrative building of the Southwestern Bell Telephone Company in St. Louis, 30 stories high, which also provides for housing central office equipments. A similar building recently erected in San Francisco by the Pacific Telephone & Telegraph Company contains administrative offices only. It has been found that where a many-storied building is necessary in order to utilize valuable land to the best advantage, such a building, even more than the smaller buildings, can be made so architecturally fine that it becomes an object of pride to the community as a whole. Buildings of similar type and more or less comparable in size are now under construction in Newark, Denver, Dallas, Kansas City, Oklahoma City, Detroit and Montreal.

### Transatlantic Telephony

An outstanding accomplishment of the year was the opening of transatlantic radio telephone service on Jan. 7, 1927, between New York and its suburban area and London and its suburban area. This service, handled jointly by the American Telephone & Telegraph Company and the British Post Office, was gradually extended on both sides of the Atlantic until, on March 26, it included all points in the United States and all points in England, Scotland and Wales. On March 11, the service was further extended to Cuba, and on Oct. 3, it was extended to the Canadian cities of Ottawa, Montreal, Quebec, Toronto and Hamilton. At the time the service was opened a total of 4.5 hours of service daily was given. At present 10.5 hours daily are given.

YEAR'S GROWTH IN TELEPHONES

| Bell System and Connecting Companies | Jan. 1, 1928 | Jan. 1, 1927 |
|---|---|---|
| Bell-owned telephones | 13,700,000 | 12,816,000 |
| Bell-connecting telephones | 4,650,000 | 4,758,000 |
| Total | 18,350,000 | 17,574,000 |
| Telephones not connecting with Bell System | 167,000 | 172,000 |
| Total telephones | 18,517,000 | 17,746,000 |

### Opening of Lines to Mexico

On Sept. 29 occurred the formal opening of telephone communication between the United States and Mexico. The establishment of communication between the American and Mexican telephone systems is another significant step in extending the effective range of long distance telephony beyond our national boundaries. The long distance circuit recently completed by the Mexican Telephone & Telegraph Company, an associated company of the International Telephone & Telegraph Corporation, extends from Pueblo to Mexico City and from there to Nuevo Laredo on the Mexican border, with a branch line to Tampico and Victoria. It crosses the border at Laredo, and from there a circuit of the Bell system connects it with the southern transcontinental route.

### New Long Distance Facilities

In addition to the foregoing, there were some notable extensions of long toll lines in 1927. Ten days after the opening of the New York-London telephone service, public service was inaugurated on the newly-completed third transcontinental telephone line following the northern route, which gives direct service between the Pacific Northwest and Chicago and eastern cities. This line provides a direct circuit between Chicago and Seattle 2,240 miles in length. The first transcontinental line to San Francisco, the central route, was opened Jan. 25, 1915. Rapid increase in public demand for long distance communication, however, necessitated a second line, and the southern transcontinental was opened in 1923 from New Orleans to El Paso and Los Angeles.

### New Methods of Handling Toll Calls

Toll service has been greatly improved through the extension of local board handling to an increasingly large portion of the total traffic and the development of better methods for use at toll boards. The short-haul low rate traffic which makes up a considerable majority of the total toll business, particularly in the metropolitan areas, is now largely handled at the local switchboards in about the same manner local calls are handled.

Until recently, the toll board business has been handled by a plan which provided for the ticketing of orders for service by a special group of operators known as "recorders," and the distribution of the tickets to other operators who undertook the work of advancing the calls over the toll lines. Through improvement in operating and supervision, it became possible to combine the recording and line-operating work. A method, taking advantage of this situation, was developed, which results in a large majority of toll-board calls being completed while the subscriber remains at the telephone; certain calls involving difficult switched connections and other special operating requirements continue to be handled by the former practice. This change in toll-board-operating plan has been introduced rapidly throughout the Bell system, the conversion being already complete except for a few cities where major equipment rerrangements, which require some time to effect, are involved.

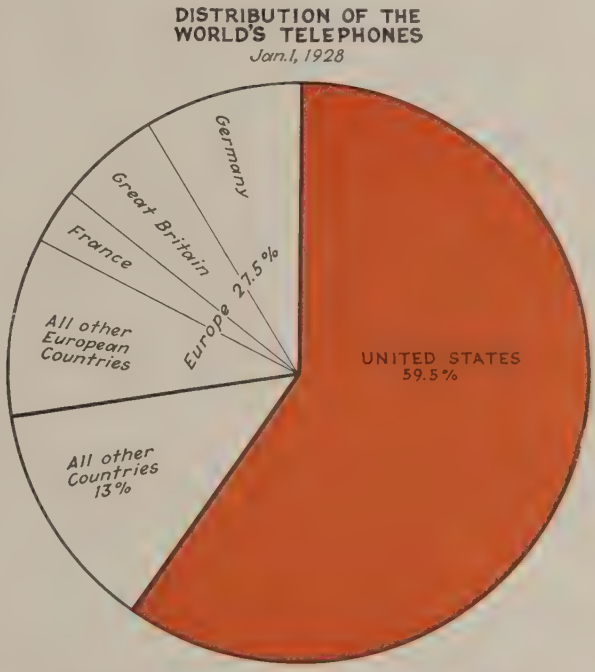
The introduction of this new toll-board method has resulted in improving the speed of service from an average of 6½ minutes in 1925 to an average of about 2½ minutes at present. The "speed of service" is defined as the interval from the time the call is received by the toll operator until the connection is established, or until a report of delay encountered in establishing the connection is given. This speed improvement has been made without unsatisfactory reactions on the efficient use of toll-line plant, which is an obviously important factor in the handling of the longer haul business.

### Reduction in Toll Rates

Coincident with the improvement and extension of long distance service, there has been a further reduction, effective Dec. 1, 1927, in the rates for talking to long distance points over the telephone lines of the Bell system. The last previous change in the rate schedule for interstate long distance service became effective Oct. 1, 1926, and represented an annual saving to the public of about $3,000,000. It is estimated that the schedule which went into effect on Dec. 1 will result in a further annual saving to telephone users of about $1,500,000. This additional reduction in rates is the result of further improved instrumentalities and methods developed by the American Telephone & Telegraph Company and the Bell Telephone Laboratories, Inc., which have effected economies applying especially to the longer circuits. An important factor in this reduction is the steady growth in the country's network of highly efficient and practically storm-proof long distance cables, a description of which appeared in last year's "Statistical Issue" of the Electrical World.

In 1927 the scope of the telephotograph service given for three years between New York, Chicago, San Francisco, and, for a shorter period, to Boston and Cleveland, was materially enlarged by the extension of the network on Jan. 10, 1927, to Atlanta and Los Angeles, and, about a month later, to St. Louis. The usefulness of the telephotograph service for the transmission of commercial documents, news pictures, police information, and for other purposes has been amply demonstrated, and important improvements of this service are under way.

Perhaps the most spectacular accomplishment in communication during the year was the development and demonstration, on April 7, 1927, of television over communication channels of the Bell system. In that demonstration, television was shown both by wire and by radio. The wire demonstration consisted of the transmission of images from Washington to New York, a distance of more than 250 miles, by wires. In the radio demonstration, images were transmitted from the experimental station of the Bell Telephone Laboratories, Inc., at Whippany, N. J., to New York City, a distance of 22 miles Images of speakers in Washington addressing remarks intended for an entire audience, and of singers and other entertainers at Whippany, were seen simultaneously with the reproduction of their voices by loud-speaking equipment. These demonstrations were not based upon any radically new discovery, but rather was it an achievement made possible by the general growth of science and by recent important technical developments, many of them previously used in the telephone service. Among these, for example, are the photoelectric cell, methods of synchronization over long circuits, the distortionless vacuum tube amplifier, and transmission networks of predetermined characteristics. While the question as to what place television will take in our communication system has not been answered, the engineers and executives who have been concerned with its development are confident that, in many ways and in due course of time, television will be found to add substantially to human comfort and happiness.



SIXTY PER CENT OF WORLD'S TELEPHONES IN UNITED STATES

Progress has continued in 1927 in the use of telephone circuits to connect radio-broadcasting stations for the

## *Bell System Statistics*

There are throughout the United States 9,162 telephone companies and in addition 29,595 rural telephone lines operated mainly on a co-operative basis, which have arrangements with the associated Bell companies for the interchange of toll traffic. These are shown in the table as Connecting Companies and Connecting Rural Lines, and their telephones as Bell-Connecting telephones. All other statistics are for the American Telephone & Telegraph Company and its 24 associated companies combined and do not include data for connecting companies or rural lines.

The Bell System includes more than 50,000,000 miles of wire.

simultaneous broadcasting of programs through the medium of widely separated stations. An example of this was the broadcasting of the speeches at the Radio Industries Banquet in New York through 75 broadcasting stations scattered throughout the United States and connected by the long distance telephone lines of the Bell system. Such extensive broadcasting could not have been done with present methods without the use of telephone wire facilities.

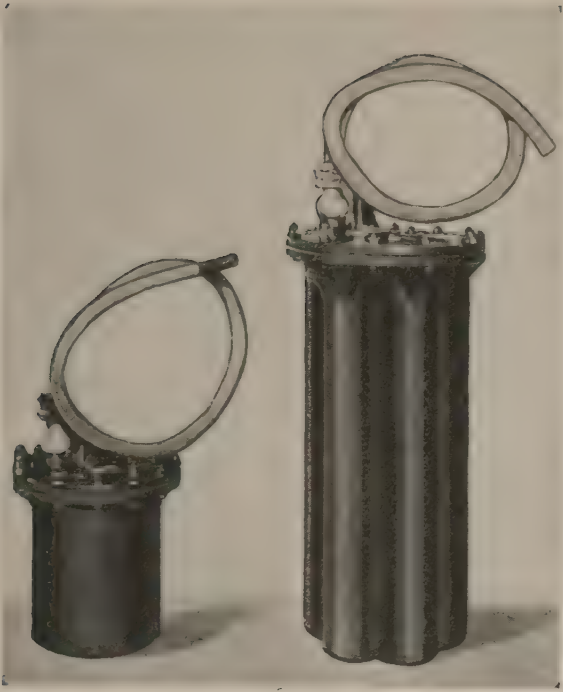
An interesting event of the year was the participation by the Bell system in the Volta Exposition at Como, Italy, held in honor of the centenary of the death of Allesandro Volta, the Italian whose electric pile was the forerunner of modern batteries. In two rooms in the exhibition building were displayed a number of photographs, charts and maps which told the story of the telephone in the United States. In addition, there were models of historical types of telephones and switchboards. A number of papers were presented by American engineers.

Research and development devoted both to physical things and to methods of operation have been perhaps the most important basic factor in the phenomenal growth of the telephone industry in the United States. Many of the results of this work are apparent to the telephone-using public and not infrequently they are spectacular. A very large part of the work is, however, directed to things of which the telephone user is generally quite unaware, the results of such work, though important, appearing only as part of the general improvements in telephone operation.

The development of loading coils, one of the plant items to which important additional contributions have been made in 1927, is an interesting example of the development and research work on all phases of the telephone plant continually carried on by the Bell system.

The commercial application of loading to telephone circuits by means of inductance coils inserted at periodic intervals goes back about 25 years. The principle of "coil loading" was discovered by Professor Pupin of

USE OF PERMALLOY HAS PERMITTED REDUCTION IN SIZE OF LOADING COILS



SMALLER LOADING-COIL CASES PERMITTED BY PERMALLOY

Columbia University and patents were issued to him in 1900. The number of loading coils in the plant of the Bell system on Jan. 1, 1926, was about 1,250,000. By the end of 1927 it is expected this number will be doubled. In order to duplicate, by the use of heavier copper wires, the transmission now obtained by the use of loading in the plant, it would have been necessary to increase the cost of the plant by a vast sum, estimated at $300,000,000. Two-thirds of the saving is in the exchange or local plant as distinguished from the toll or long distance plant.

The term "loading" comes from the mechanical analogy of a "loaded" string, the study of which by a French mathematician was made good use of in developing the theory of loading. If one attaches a light cord, say fifteen feet long, to a rigid support at one end, then shakes the free end, waves much like waves on water are set up. These waves die out rapidly along the cord. Now if small weights, small pieces of wire solder, for example, are placed about six inches apart along the cord and it is again shaken at the free end, waves are set up, but their rate of dying out or attenuation is quite different. The cord is analogous to a telephone line, and the weights to loading coils. The effect of loading is to reduce the attenuation of the mechanical waves in one case and the electrical waves in the other. It makes the line a better path for electrical waves.

Loading telephone circuits has another effect, in addition to reducing attenuation. To reproduce speech requires the transmission of a wide "band" of frequencies. Maintaining the integrity of the complex wave shape of speech means transmitting this range of frequencies with substantially equal attenuation. Loading is used in cables to improve the line in this respect and reduce distortion.

The practical value of loading will be realized from the statement that a loaded circuit in cable may be as good as an unloaded circuit having about eight times as much copper per mile of wire. The development of loading has followed a course much like that of many other inventions. First, there was the application of the principle by extensive design and development work, so that loading coils could be reliably and economically placed in the line. Next, there was the continuous improvement, over a period of nearly 25 years, to better the performance and reduce the cost. The development of the vacuum tube repeater and its application to long circuits brought about the need for extensive changes in loading. For open-wire lines it became evident that, with repeaters, loading coils could be dispensed with, while for cables, new types were required, having a degree of precision and stability not needed before the advent of repeaters.

Of comparable importance with the use of loading coils in the toll cable plant is their increasing application to the local exchange plant. The loading of local trunks has not only resulted in improved service, but has effected large economies by permitting a further extension of the use of small gage cable.

One important phase of the development has been the improvement and reduction in the cost of the core of the loading coil. In an early type of coil, about ten miles of wire no larger than a hair were required for the

core. A later type of core was developed, composed of compressed iron dust, which has many physical advantages over the old and is cheaper.

The latest step forward in the design and construction of loading coils is the direct result of a fundamental scientific discovery on the part of the Bell Telephone Laboratories, Inc., of a material, "permalloy," with new and unusual magnetic properties which are peculiarly suited to the requirements of telephony. The permalloy used in loading coils is an alloy of about four-fifths nickel and one-fifth iron, specially heat-treated. Permalloy is the discovery of G. W. Elmen, of the Bell Telephone Laboratories, Inc. One of the first uses of this new material was for loading transatlantic telegraph cables, but the forms in which the metal was used for this and other purposes were wholly unsuited for loading coils. After continuous experimental work extending over several years, the laboratories and manufacturing experts succeeded in making a core of permalloy dust which permits a great reduction in size of coils for both local and toll use. Not only has there been a substantial reduction in the cost of the coil, but the reduction in size permits economies in potting and space economies in manholes, which are extremely important, particularly in thickly settled areas. Coils of the new types will be used in new construction, but they will not make necessary the replacement of the older types already in the plant or render them obsolete.

The benefits derived from the use of loading coils and other developments, such as improved transmitters and receivers, repeaters, and improved apparatus generally, together with improved cable, are not only permitting the utilization of smaller gage wires than has hitherto been possible, but the economical field for aërial and underground toll cables has been extended into the region which not many years ago it was possible to

serve only with some form of open-wire construction. This is of inestimable value from the standpoint of service.

There has been continued progress in the co-operation between communication and electrical supply companies in working out problems common to both, which arise from the proximity of their wire systems. Studies are being made of the new problems brought up by the construction of superpower lines, also those due to the more rapid introduction of rectifiers in railway operation, as well as many other problems arising out of the growth and development of the electrical arts. The work in 1927 on research under the joint general committee of the N.E.L.A. and the Bell Telephone system promises further important advances in the development of a closer understanding between the utilities, with resulting improvements in safety and economy in their public services.

Illustrating the general improvement in local exchange service is the steady reduction in the number of exchange plant troubles per unit of plant. In 1926 this reduction was 17 per cent. Continuing improvements in handling interoffice calls have been made in the last year and the use of such methods as "straightforward trunking" have been extended. The introduction of the dial telephone system continued in 1927, with the result that the number of telephones in the Bell system operated with dial equipment increased during the year from about 2,000,000 stations to over 2,500,000 stations. Dial equipments are being installed where new switchboard equipment is needed and where consideration of the circumstances makes their use advisable.

### Distribution of Telephone Stock

In the last year there has been an increase in the number of those holding securities of the telephone companies. The most widely-held stock, of course, is that of the American Telephone & Telegraph Company. The accompanying charts show the increase in stockholders of this company and bring out the fact that the average holding per stockholder is small. Many of the stockholders of the American Telephone & Telegraph Company are employees and many more, of course, are customers.

It is particularly true of the telephone business that satisfactory service depends in no small measure upon satisfactory relations between the company and its customers. Efforts have been continued in the last year, not only further to improve the technical features of telephone service, but also to maintain a sympathetic understanding between the users of telephone service and those furnishing that service.

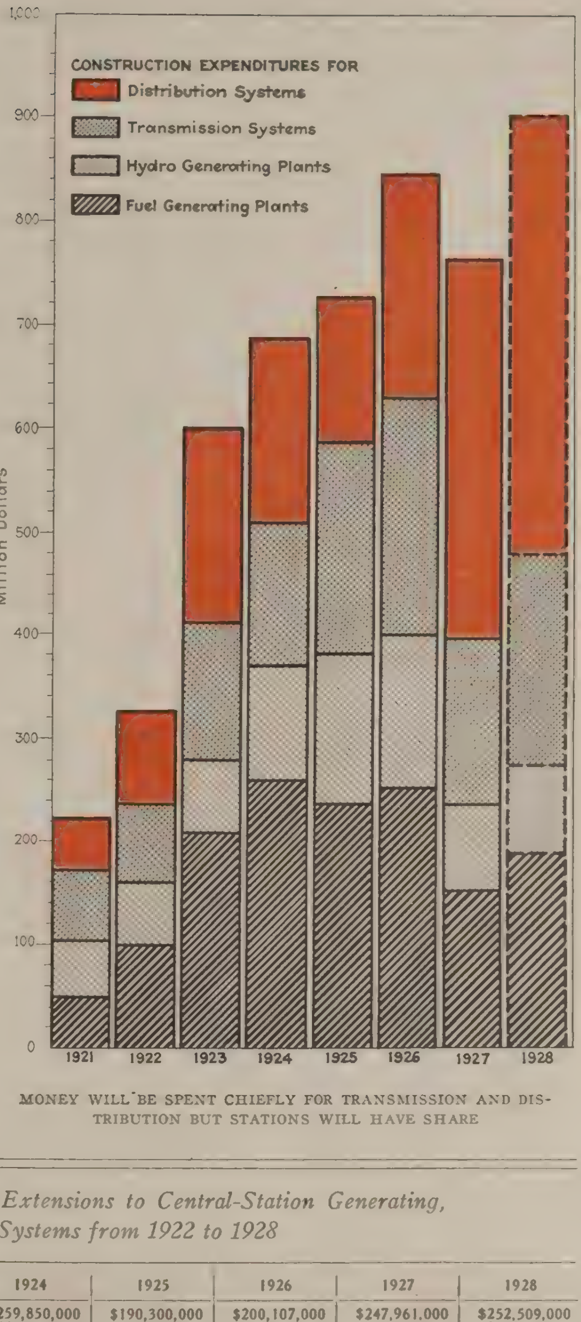
# Utility Budget for 1928 $900,363,000

Revival of building indicated. Expenditures in 1927 aggregate $760,353,000. Distribution expenditures predominate

TELEGRAMS to the ELECTRICAL WORLD from light and power companies indicate a budget of $900,363,000 for 1928. This is the largest expenditure for new facilities indicated in the history of the industry and shows that a decrease in spending for 1927 will be compensated for in 1928.

In every section of the country there are increases in budgets, but the Southern states and North Central states lead in increases. If load densities and age are considered, there is no doubt that the Southern states have embarked upon the largest program of expansion.

For several years the larger proportion of expenditures has been for distribution facilities. During 1927 the sum of $362,316,501 was spent on distribution, and in 1928 this sum aggregates $424,042,695. In 1927 the sum of $163,153,380 was spent for transmission, and in 1928 the budget is $203,396,121. In 1927 the sum



MONEY WILL BE SPENT CHIEFLY FOR TRANSMISSION AND DISTRIBUTION BUT STATIONS WILL HAVE SHARE

*Budget estimates.

of $234,883,000 was spent for generating stations, and the budget for 1928 is $272,924,000.

Expenditures in the utilitiy industry shift in well-recognized cycles. In 1926 expenditures for generating stations and transmission lines reached a peak, and it is logical to expect large expenditures for distribution in 1927 and 1928. When the stations and lines become loaded, another station building period is to be expected that will call for expenditures in excess of those of 1926. But these cycles of building are not extreme, because each year there is a large station building program. Demand for service grows continuously and must be met.

In 1927 a large utility budget was indicated, but many budgets were cut later in the year for divers reasons. Some unsettled political conditions, major efforts to reduce fixed charges, a desire to catch up with the facilities already built and changes in property ownership had an influence to reduce expenditures. But with telegrams from systems sent to the ELECTRICAL WORLD aggregating $800,000,000 for the 1928 budget and with these properties representing only 75 per cent of the generating capacity, it is clearly evident that the light and power industry expects to spend a large sum of money in 1928. Past experience indicates that stopping expenditures during one year merely postpones the day when expenditures commensurate with growth must be made. An example of this is found with one group of properties that spent $44,000,000 in 1927 but has a budget of $106,000,000 for 1928.

In New England the flood damage will result in about $6,000,000 increase in next year's expenditures. In the Middle Atlantic and East-North Central states about $400,000,000 will be spent, with distribution expenditures the largest item. Large expenditures are indicated for the Southern and Southwestern states and between the Mississippi River and the Rocky Mountains. In these regions generating stations will be built in large numbers to supply the needs of these rapidly growing regions.

*Table IV—Value of Additions and Extensions to Transmission and Distribution Systems from 1924 to 1928*

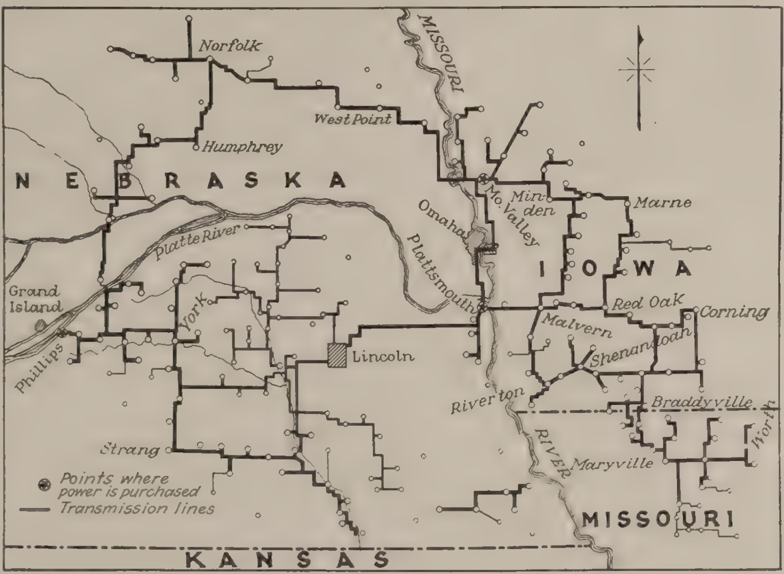
# Interconnection Brings Mergers

Consolidation of light and power properties follows the extension
of transmission systems. Trend to group operation
and ownership continues. Record of mergers

THE business of grouping utility properties has developed so greatly that the economic and operating advantages can be measured in tangible savings. As a consequence, the light and power industry has been very active with mergers and the regrouping of properties during the last year. Low money rates, because of good utility credit, have helped to bring about consolidations that will return savings, and experience with past operations has brought about a technique of consolidation whereby less speculation has been involved in merger transactions and fewer speculative or amateur operators have attempted to develop holding organizations.



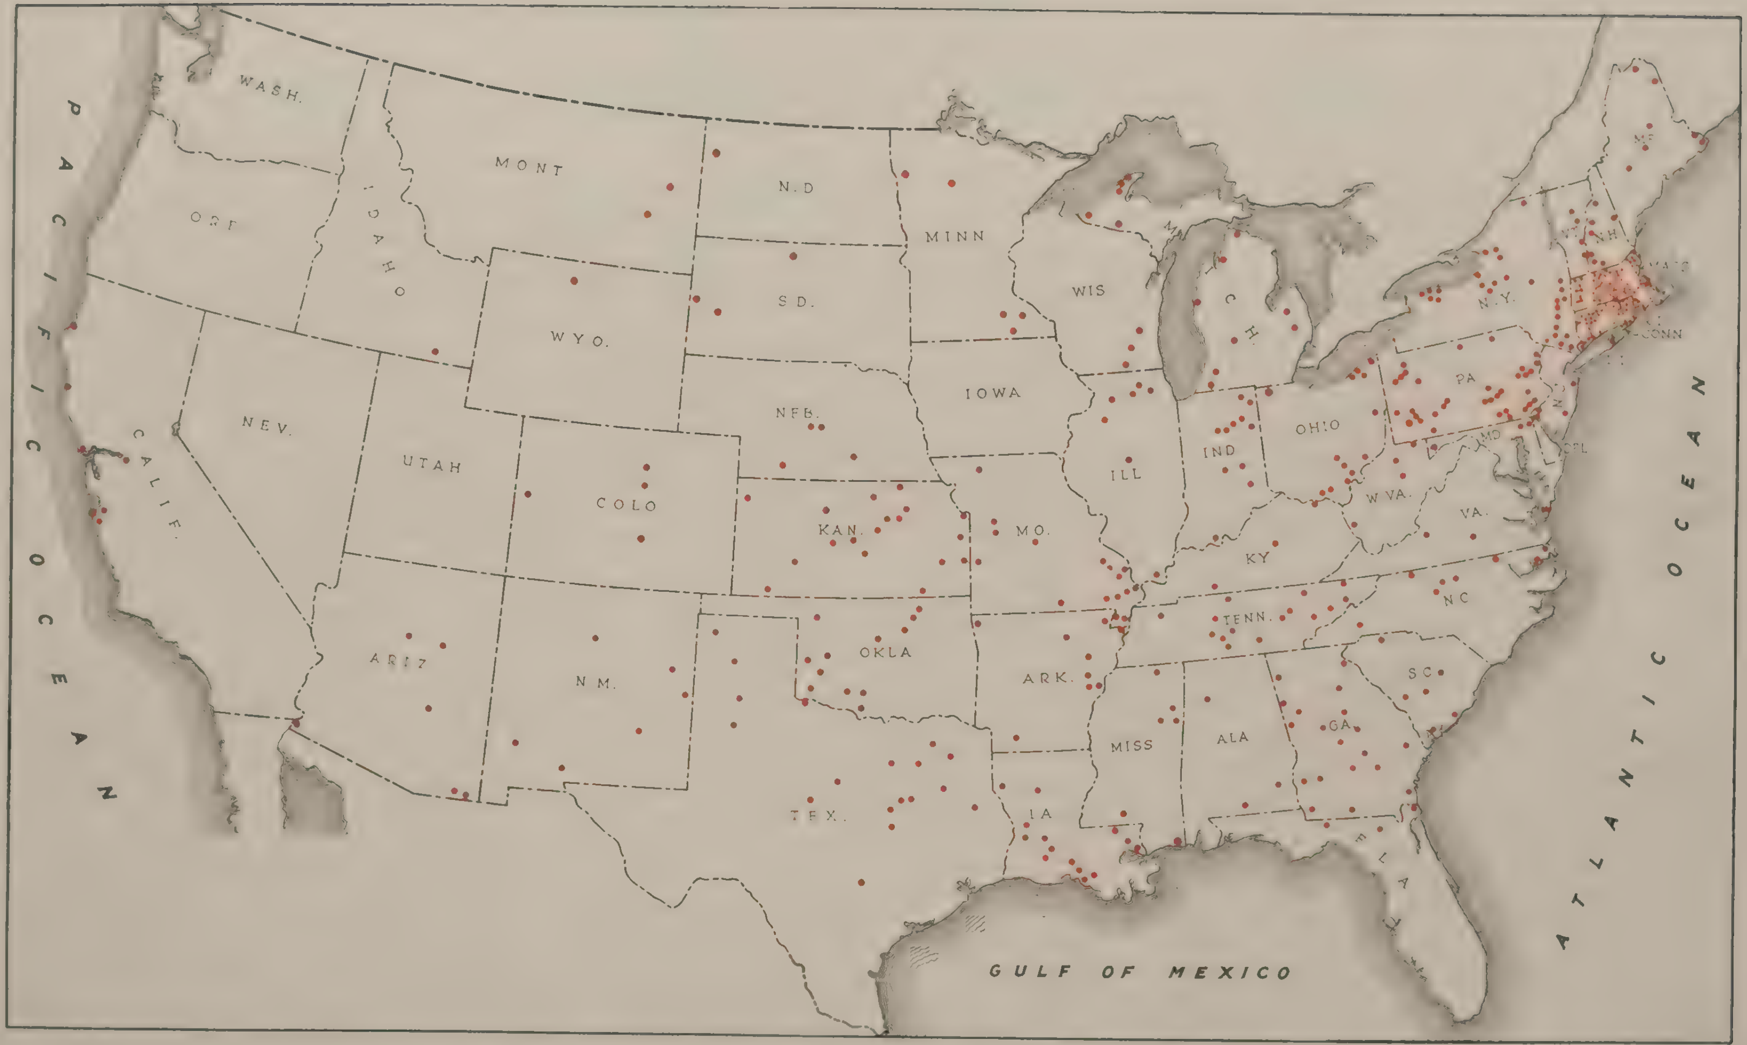
SMALL TOWNS OF IOWA AND NEBRASKA HAVE BENEFITED BY INTERCONNECTIONS

Mergers in the light and power industry are of three or four types. The extension of transmission systems makes it economical to take over small municipal and small private plants adjacent to the extended lines of large utilities. This type of merger has been very active in the South and in the West. Another type of merger is brought about by the purchase of several small properties in different parts of the country. Through consolidated financing and consolidated engineering and management, these properties are tuned up and put on a much more economical basis of operation. Often these properties are later merged into one of the large holding groups. This type of merger has been active in the Southwest and West. Another type of merger has been the formation of a joint control holding company consisting of many small properties, which do not give up their identity or control, but do give to a central organization certain authority for commitments. Massachusetts has developed this type of merger to the greatest extent. There is still another type of merger that has been a recent development and this involves the merging of holding companies themselves and the sale or trade of subsidiary properties, so that each holding company concerned develops a more logical and more profitable grouping of subsidiary properties. During the last year some very large mergers of this type have been made.

During 1927 a total of 828 utility changes occurred. These changes involved direct mergers, change in ownership or change in name and corporate structure. A total of 181 municipal plants were included and these plants were absorbed into large privately owned utilities. This left a total of 647 changes in the corporate name or structure of privately owned properties. States in which municipal plants were taken over to the greatest extent were Georgia, Nebraska, North Carolina and Oklahoma. States in which changes in corporate structures of private plants were carried out to the greatest extent were Massachusetts, New York, North Dakota, Texas, Illinois and Pennsylvania.

There has been great activity in the purchase of small private plants in New England, along the Atlantic seaboard and in the Middle West states. In Georgia, Nebraska, North Carolina and Oklahoma many small municipal plants have been taken over by large transmission systems. The Southeastern Power & Light Company, Middle West Utilities Company, Massachusetts Utilities Investment Trust, Mohawk Hudson Power Corporation and Otter Tail Power Company are holding companies that have been active in purchasing.

The Middle West Utilities Company, through subsidiaries, now serves 1,920 communities in eighteen states with a population estimated at 3,665,000, and, in addition, supplies wholesale energy to 380 other communities with an estimated population of 602,000. It has 204 steam stations and 133 hydro stations to supply energy to a transmission system of 14,454 miles. In Arkansas, Louisiana and Texas, the Southwestern Gas & Electric Company, a subsidiary, has acquired the Gulf States Utilities Company and the East Texas Public Service Company, the eastern Texas properties of the American Public Service Company. In addition, the Southwestern Gas & Electric Company has purchased plants and extended service to Center Point, Cove, DeQueen, Dierks, Foreman, Gillham, Hatfield, Horatio, Locksburg, Mineral Springs, Murfreesboro, Nashville and Winthrop in



## *Where Major Corporate Changes Occurred in Past 18 Months*

The approximate location of each town in which ownership has been changed, or where the utility has been merged with another, or where the holding company has been changed or merged with another is indicated. Towns of less than 2,500 population have not been included. For details the reader is referred to the accompanying tables and the Bonbright survey.

Arkansas. In Oklahoma, the Southwestern Light & Power Co., also a subsidiary, acquired the Elk City and Clinton properties of the Oklahoma Gas & Electric Company and purchased the municipal plants at Bessie, Blair, Fort Cobb, Hinton, Leedy and Martha. The Chickasha Gas & Electric Company has been transferred to this subsidiary.

In Illinois another subsidiary of the Middle West Utilities Company, the Central Illinois Public Service Company, purchased plants at Chesterfield, Hardin and Littleton and the municipal plant at Granville. Other subsidiaries that have been active in extending their systems are the Illinois Northern Utilities, the Interstate Public Service Company in Indiana, the Central Power Company in Nebraska, the Southern New Hampshire Hydro-Electric Company, the New England Public Service Company, the Kentucky Utilities Company, the West Texas Utilities Company, the Central Power & Light Company and the Wisconsin Power & Light Company. The Middle West Utilities Company acts as the financial agent for the subsidiaries and as a consultant in operation and management.

In Oklahoma, the Public Service Company of Oklahoma, a subsidiary of the Middle West Utilities Company, has been active. It has under construction a steam station at Weleetka, which will eventually be connected by a 66,000-volt transmission line with the West Tulsa plant of the Oklahoma Power Company. The Public Service Company sold Guthrie, Mulhall, Langston, Perkins, Coyle and Vinco to the Oklahoma Gas & Electric Company and purchased the Oklahoma Power Company of Okmulgee. These and other changes secured a better arrangement of properties for both the Public Service Company and the Byllesby properties in that state. Interconnections and energy in exchanges between the Public Service Company and the Oklahoma Gas & Electric Company have been arranged that will be advantageous to both properties.

### U.G.I. Expands Greatly

The United Gas Improvement Company greatly extended its utility holdings during the last year, chiefly through purchased control of Day & Zimmermann and the Philadelphia Electric Company. Early in the year, Day & Zimmermann acquired part of the A. E. Fitkin utility interests. The most important properties in the Fitkin group were under the holding of National Public Service Corporation and are the Jersey Central Power & Light Company, Virginia Public Service Company, Tide Water Power Company, Florida Power Corporation, Municipal Service Company, Eastern Shore Gas & Electric Company and numerous subsidiaries. The National Public Service served a population of 1,256,000 in 621 communities. Later the National Public Service was acquired by the Insull interests who thus control all of the Fitkin properties. The U. G. I. Company expanded its holdings in the West, where the Iowa Public Service Company, a subsidiary, acquired the Central Iowa Power & Light Company and the Iowa Light, Heat & Power Company.

In the Philadelphia area, the U. G. I. Company merged the Counties Gas & Electric Company, the Philadelphia Suburban Gas & Electric Company and sixteen smaller units into the Philadelphia Suburban Counties Gas & Electric Company, and recently acquired sufficient stock to control the Philadelphia Electric Company, one of the oldest and largest metropolitan utilities. In Nebraska, the U. G. I. has purchased properties at McCook and Gothenburg. These developments, together with properties already held, place the United Gas Improvement Company in the front rank of large holding organizations.

The Standard Gas & Electric Company sold the Sierra & San Francisco Power Company, the Western States Gas & Electric Company and the Coast Valleys Gas & Electric Company to the Pacific Gas & Electric Company, thus giving the last-named company properties in northern California that will help greatly in making a unified system for further power development. The Oklahoma Gas & Electric Company has co-operated with the Public Service Company of Oklahoma in the rearrangement of holdings in that state. It purchased the Gage and Shattuck plants from the Southwestern Light & Power Company, six plants from the Public Service Company and three municipal plants. This company has added greatly to its generating capacity and transmission system during the year.

MUNICIPAL AND PRIVATE PLANTS SOLD IN 1927

| | Number of Plants | | | Number of Plants | |
|---|---|---|---|---|---|
| State | Private | Municipal | State | Private | Municipal |
| Alabama | 5 | 4 | Nebraska | 23 | 22 |
| Arizona | 5 | ... | New Hampshire | 4 | ... |
| Arkansas | 12 | 3 | New Jersey | 12 | 2 |

| Minnesota | 14 | 5 | Wisconsin | 20 | 3 |
| Mississippi | 2 | 6 | | | |
| Missouri | 20 | 1 | | | |
| Montana | 3 | 1 | Total | 593 | 181 |

In the utility groups associated with the Electric Bond & Share Company, several changes have occurred. The Arkansas Power & Light Company acquired four private plants and three municipal plants, and now serves 107 communities. The Louisiana Power & Light Company acquired the Winnsboro municipal plant, and the Mississippi Power & Light Company took over the municipal plants at Carrollton, Isola and Tupelo. The Nebraska Power Company acquired the electric light and power properties of the Omaha and Lincoln Railway & Light Company. It has taken over several municipal plants, has purchased several properties from the Central West Public Service Company and has extended service to several communities near its transmission lines. The Pacific Power & Light Company, the Texas Power & Light Company, the Houston Lighting & Power Company and the Northwestern Electric Company extended service to private and municipal plants in their respective service areas.

The Southeastern Power & Light Company has been co-ordinating its large system and extending transmission lines into new territory. The Alabama Power Company has purchased a number of properties, including the Gulf Electric Company and the Houston Power Company. The Georgia Power Company acquired Ball Ground, Chamblee-Camp Gordon and eight municipal plants. It merged the properties of the former Georgia Power Company and the Georgia Light, Power & Railways into a co-ordinated unit.

The new company supplies the industrial area of central and northern Georgia, including 89 communities served directly and 48 municipalities that purchase power at wholesale. New transmission lines are being built to interconnect the different Southeastern properties and generating capacity is being added at a rapid rate.

In the American Gas & Electric Company group, the Indiana & Michigan Electric Company of South Bend has bought the Allen County Electric Light & Power Company and the Indiana Power & Light Company. The Atlantic City Electric Company has acquired the Atlantic County Electric Company and the Electric Company of New Jersey, which serves all of southern New Jersey below Camden and Woodbury, and west of the West Jersey & Seashore Railroad.

INTERCONNECTION HAS AFFORDED TERRITORY SOUTH OF THE GREAT LAKES THE BENEFITS OF LARGE MODERN STATIONS

In the East several changes in utility groupings have occurred of major magnitude. The New York Power & Light Corporation was formed by the merger of seven utilities which are subsidiaries of the Mohawk Hudson Power Corporation. The total population served is more than 750,000 and the generating capacity of the system is 230,840 kw. The Massachusetts Utilities Investment Trust was formed by 45 utilities affiliated with the Massachusetts Lighting group and of voluntary associations of groups holding utility shares. The controlled companies serve 94 communities with a population of 600,000. Insull, Son & Company acquired control of the National Electric Power Company, which operates properties in Maine, Pennsylvania, Nebraska, Ohio, Indiana, Michigan, South Dakota, Kansas, Oklahoma and Arkansas, including the Cumberland County Power & Light Company of Portland, Me., the Penn Central Light & Power Company, the Kansas Electric Power Company and others serving a population in excess of 1,125,000 in more than 450 communities. Other important acquisitions of Insull, Son & Company were the Inland Power & Light Corporation, which serves 320 communities in five states and the Western United Gas & Electric Company in southern Illinois. The latest acquisition of the Insulls was the National Public Service Corporation, a former Fitkin property serving 621 communities in Pennsylvania, Florida, Virginia, New Jersey and Georgia and elsewhere with electricity, gas, railway, ice and other services.

Many other changes in utility ownership will be found in the accompanying tables. Some of these changes involve change in ownership, others are mergers under one control and still others represent changes in corporate name and corporate groupings of properties. It is evident that consolidation of utility properties proceeds apace and that the extension of large transmission systems inevitably results in taking over small properties that can be served more economically from large systems.

# Utilities Raise $2,128,000,000

### Low money rates and increased budget demands create unprecedented volume of financing. More than billion added to capitalization. Refunding operations active

By H. M. Cameron

*Financial Editor*

BREAKING the highest previous record in financing by nearly 50 per cent, the power and light industry last year absorbed the stupendous total of well over two billion dollars. Such a program has never been exceeded by any single industry in a corresponding space of time. This large sum represented one-fourth of all the financing done in the public money markets of this country. About half of it represented refinancing at lower rates of interest and the balance was required for expenditures in the properties.

The industry's refinancing program called for $879,000,000. Not only have such operations brought about a huge saving in interest charges—probably ten to fifteen millions annually—but they have also promoted simplification and strengthening of capital structures in a large way. Scores of corporate issues bearing higher interest rates than those now ruling have been retired and replaced by lower-priced obligations. The saving frequently has been as high as 1½ to 2 per cent. Economies of this nature are comparable, in so far as their benefits to the industry are concerned, to lower construction or operating costs; they place the companies in a position to show better earnings on their junior securities. Public utility companies incidentally are able to reap greater benefit from refinancing than most industrial concerns, since a larger proportion of their capital normally is in the form of interest-bearing obligations.

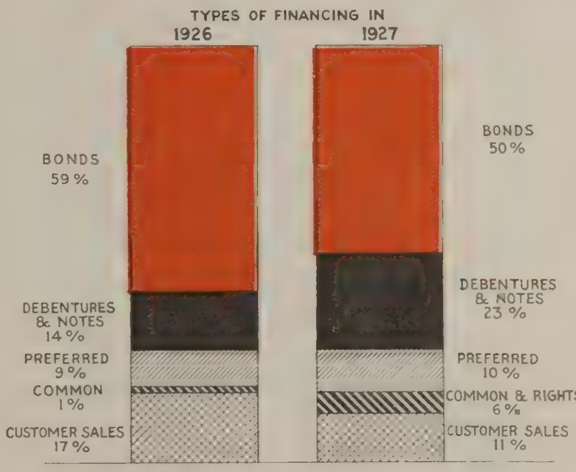
In comparison with the past few years all classes of financing show the downward trend of money rates. Mortgage bonds were marketed at an average rate of 5.00 per cent, against an average of 5.40 per cent in 1926 and of 6 per cent in 1924. A substantial number of large issues were floated during the year on a 4½ per cent basis—a situation until recently without precedent during the present decade. There is little in the current situation to indicate any change in the present downward trend of rates within the near future.



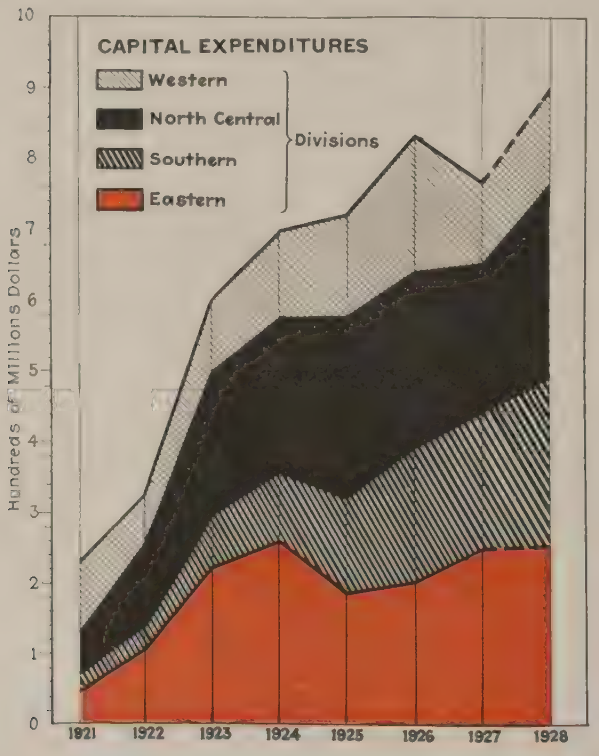
FIFTY PER CENT OF LIGHT AND POWER FINANCING IN 1927 WAS IN BONDS

Debentures were sold at an average yield of 5.69 per cent, against 6.20 per cent in 1926. The average on notes was 4.09, against 5.50 per cent, and on preferred stock 6.16, against 6.84 in 1926.

Despite the unusually favorable bond market that has existed throughout 1927, with the exception of a few weeks in summer when there was a temporary oversupply, bond financing constituted a smaller proportion of the total than in 1926. The percentage of publicly sold issues was 52, against 59. The aggregate dollar value of bonds sold, however, exceeded the 1926 total by $294,000,000. There was only a slight change from the previous year in debenture and note financing, which constituted 17 per cent of the total, against 15 per cent in 1926. Preferred stock sold publicly accounted for 10 per cent of the total, against 8, and the volume of customer sales, as discussed in detail elsewhere, fell off to 11 per cent of the total, against 17 per cent in 1926.

For some years it has been the practice of certain of the power and light companies, as well as leading industrial corporations, to raise a portion of their capital requirements directly from their shareholders by issuing rights or option warrants for the purchase of stock. Although there has been no attempt in our previous annual summaries to compute and include totals for such financing, account of it has been taken during 1927. The aggregate of rights and warrants presumed to have been exercised, or in any event underwritten, was $145,274,564. For purposes of convenience the date of offering is taken as the date of the financing in view of the impossibility of tracing the actual raising of the funds through the execution of the rights. Obviously comparisons with totals for previous years are inaccurate unless account be taken of this item not previously included.

Although much effort has been expended during 1927 toward securing legalization of utility securities for savings bank and trust investment, little of a tangible nature has yet been accomplished. Savings bank and trust company funds available for investment have multiplied rapidly during the past decade, whereas there has been virtually no extension in the volume of securities authorized for such investment. Few would dispute the safety and suitability of power and light company bonds for this purpose, but the general public, and legislators in particular, appear to need much more education along these lines. Institutional buying, however, on the part of insurance companies, investment trusts and other financial and fiduciary institutions has expanded materially during the year.



NORTH CENTRAL AND SOUTHERN UTILITIES PLAN LARGEST INCREASE IN CAPITAL EXPENDITURES, WHILE EAST AND WEST CONTINUE AT PRESENT RATE

*Revenue and Expenses During 1927*

| | Gross Revenue | Operating Costs | Net Revenue |
|---|---|---|---|
| January | $162,000,000 | $63,900,000 | $98,100,000 |

| October | 154,000,000 | 67,400,000 | 86,600,000 |
| November | 159,000,000 | 65,600,000 | 93,400,000 |
| December | 170,000,000 | 69,500,000 | 100,500,000 |
| | $1,783,700,000 | $766,700,000 | $1,017,000,000 |

Supplementing the normal growth of the industry, aggressive business promotion during 1927 produced an 8 per cent rise in gross revenues over 1926. At the same time operating costs increased only 6 per cent, allowing for a growth of almost 10 per cent in net revenues. Gross and net revenue and operating cost figures for the year by months are given in the accompanying table.

A significant trend evident in statistics of the power and light industry over a period is the steady reduction in the operating ratio. During the period covered in the attached statistical analysis, the ratio has been gradually reduced from 50 per cent in 1920 to 43 in 1927. This, in the face of stable if not lowered rates to consumers, may be regarded as an achievement in the administration of the utility industry. It is due in no small part to the economics resulting from merger and interconnection developments. The analysis of revenue received in relation to power generated and customers served shows the earning position of the industry during the period since 1920.

*Six-Year Record of Financing*

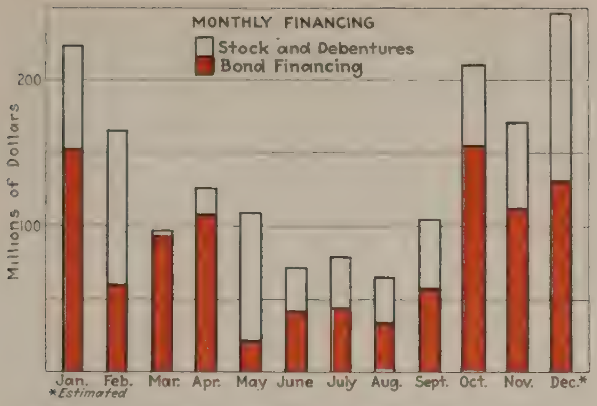
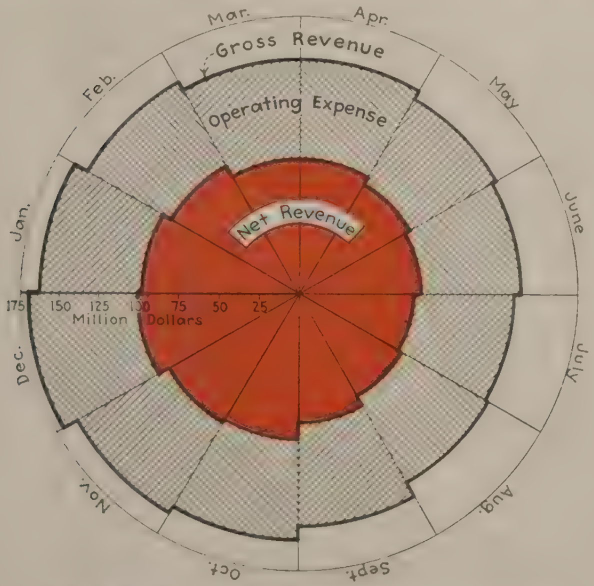
*Average number of customers at beginning and end of year.



VOLUME OF FINANCING REACHED UNPRECEDENTED LEVELS AT END OF 1927

aggregate capitalization of the operating companies and the holding companies. It contains duplication in that the common stock of an operating company is held by a holding company and, in theory at least, the capitalization of the holding company should equal the aggregate amount of the common stocks of operating companies which it holds. Thus this duplication involves the common stock. Another complication occurs in that many holding companies own stocks of industrials, gas companies, water companies and railroads in addition to utilities, so that their capitalization is based on a total stock holding in excess of their operating light and power company stocks. Further, it may be noted that the capitalization used represents face value of securities when issued.

In computing the capitalization figure the census of 1922 was taken as a basis, and for each year since that time annual totals of securities sold are added after that portion used for refunding purposes is deducted. Since many holding companies finance for their operating companies and since many inter-company security holdings exist, it is very difficult to make a tabulation that separates the capitalization of operating and holding companies. The census of this year will make available the capitalization of the operating companies and with those data it will be possible to subdivide the capitalization figure used in this issue. But as an industry statistical fact the total capitalization should be given to show relative changes each year.



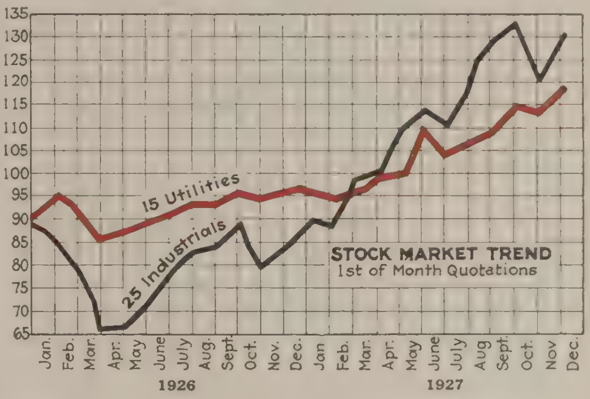
OPERATING COSTS ARE PRACTICALLY UNIFORM, WHILE NET REVENUE IS HIGHEST IN WINTER MONTHS

---

# Markets Forge Upward to New Levels in 1927

### Disregarding threatened market break and possible effect of federal investigation, investors accumulate utility stocks in unprecedented volume

HEAVY investment accumulation of utility stocks in unprecedented volume, forcing averages to new high levels, is the story of the utility markets during 1927. With one or two exceptions, prices reached new high averages every month of the year. Disregarding such factors as a threatened break in stock exchange prices and the possible psychological effect of a federal investigation, investors have shown implicit confidence in the future of the power and light industry and in the soundness of its securities.



UTILITY STOCKS FLUCTUATE WITHIN NARROWER RANGE THAN INDUSTRIALS

Illustrating the action of the markets more specifically, the accompanying graph of the average of fifteen power and light common stocks registers a net advance of 35 points since the beginning of the present movement in April, 1926. Of this advance, approximately 25 points were made during 1927. Collectively, the companies included constitute more than one-third of the industry in gross revenue and may, therefore, be regarded as representative. The importance of this advance, in dollar values, is shown by a study of the change in aggregate market value of these stocks during the period. The total value at the beginning of the period was $1,658,000,000 and at the end $2,136,000,000, showing a net appreciation of $478,000,000, or 29 per cent.

Preferred stocks have shown a steady and consistent appreciation during the year. Levels are now several points above those of last January and investment buying in these issues has shown a definite expansion.

Bond values also registered a steady advance during 1927. Demand for high-grade power and light issues, both for private and for institutional investment, has increased steadily. Under this influence, yields have been steadily reduced until financing has recently been carried on by some of the leading companies on a 4½ per cent basis—the lowest level in nearly twenty years.

# Customers Invest in Industry

## Customer ownership sales approach $240,000,000. Light and power securities widely held. 343,000 transactions in twelve months. Average sale about $700

Despite money market conditions which favored utility financing by the floating of securities in financial centers, the practice of selling stock locally to customers and employees was continued in 1927 at virtually the same pace as in the preceding year. In the twelve months beginning with November, 1926, the total sales, as indicated by monthly reports to the Electrical World, aggregated $248,325,000; the number of transactions was 376,400, and 3,516,000 shares were sold. For the calendar year 1927 it is estimated that sales will amount to $240,000,000 or slightly more in value and that about 3,480,000 shares will have been sold in 343,000 transactions. The average is close to $700 per transaction. The odd average of $69 per share is due to the influence of a considerable number of shares at other than $100 par, notably the large sales of $25 shares by one prominent company.

*Security Sales 1920-1927, Inclusive*

| | Sales by Investment Houses | Sales Direct to Customers | Per Cent Direct to Customers |
|---|---|---|---|
| 1920 | $326,374,000 | $43,000,000 | 11.7 |
| 1921 | 458,917,000 | 80,000,000 | 14.8 |
| 1922 | 589,961,000 | 130,000,000 | 18.1 |
| 1923 | 747,722,000 | 175,000,000 | 19.0 |
| 1924 | 982,421,000 | 254,000,000 | 20.6 |
| 1925 | 982,223,000 | 297,561,800 | 23.2 |
| 1926 | 1,150,965,000 | 236,557,100 | 17.1 |
| 1927 | 1,888,909,000 | 240,000,000† | 11.3 |
| Total 1920–1927 | $7,127,492,000 | $1,456,118,900 | 17.0 |

† November and December estimated.

Comparison with 1926 indicates that the money value of securities sold was about the same in both years, but there was a wider distribution of sales. In the earlier year, according to the report of the customer-ownership committee of the National Electric Light Association, companies reporting sold 2,686,187 shares, valued at $236,557,100 in 248,867 transactions. The shares, therefore, increased by 30 per cent and the number of transactions by 37 per cent.

From the data at hand, a segregation of repeated sales to the same purchaser is impossible. The report previously mentioned gives the number of customer and employee stockholders at the end of 1926 as 1,432,277. Whether these are all different individuals or whether the figure is the sum of the number of sales is not clear. In either case, it indicates broad dissemination of the securities in the territory served.

Adding to the given number the transactions in 1927 results in a total close to 1,800,000. This would mean a stockholder for every ten residential customers, if repeat sales have been excluded; it means, in any event, a sale for every ten present-day customers. Most of this has been achieved since 1920.

Because of the unprecedented magnitude of sales of securities through investment houses, the money raised in 1927 by customer-ownership sales is a smaller fraction of the total than in other recent years: it constitutes about 11 per cent. The average for the seven-year period from 1920 to 1926, inclusive, was 19 per cent. This change of balance is more fully discussed in other articles in this issue, relating to public utility financing.

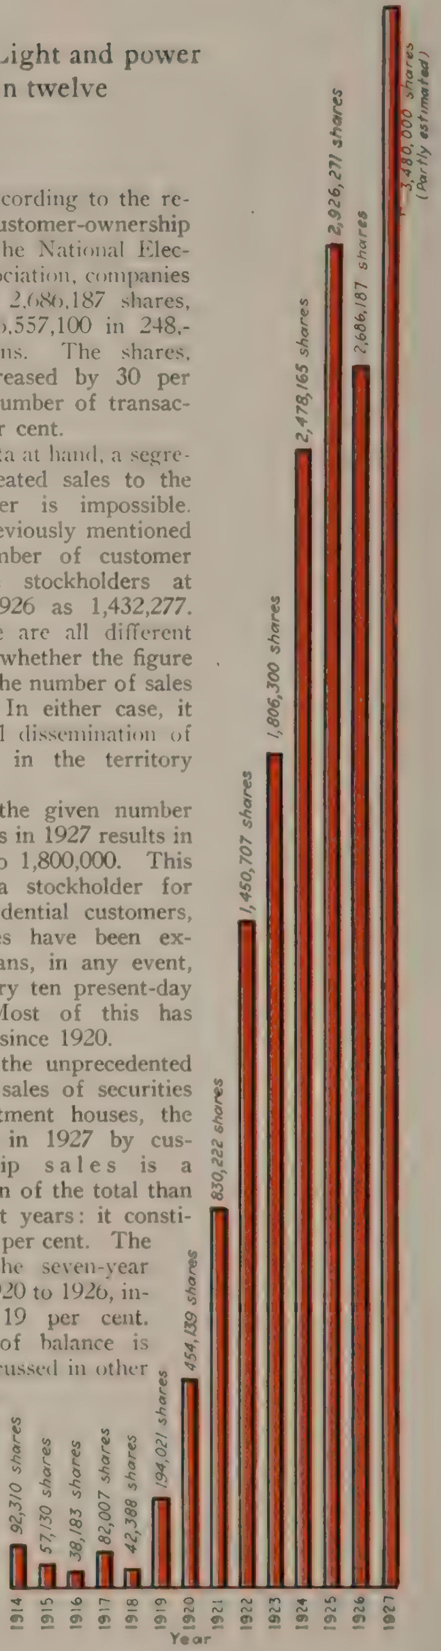
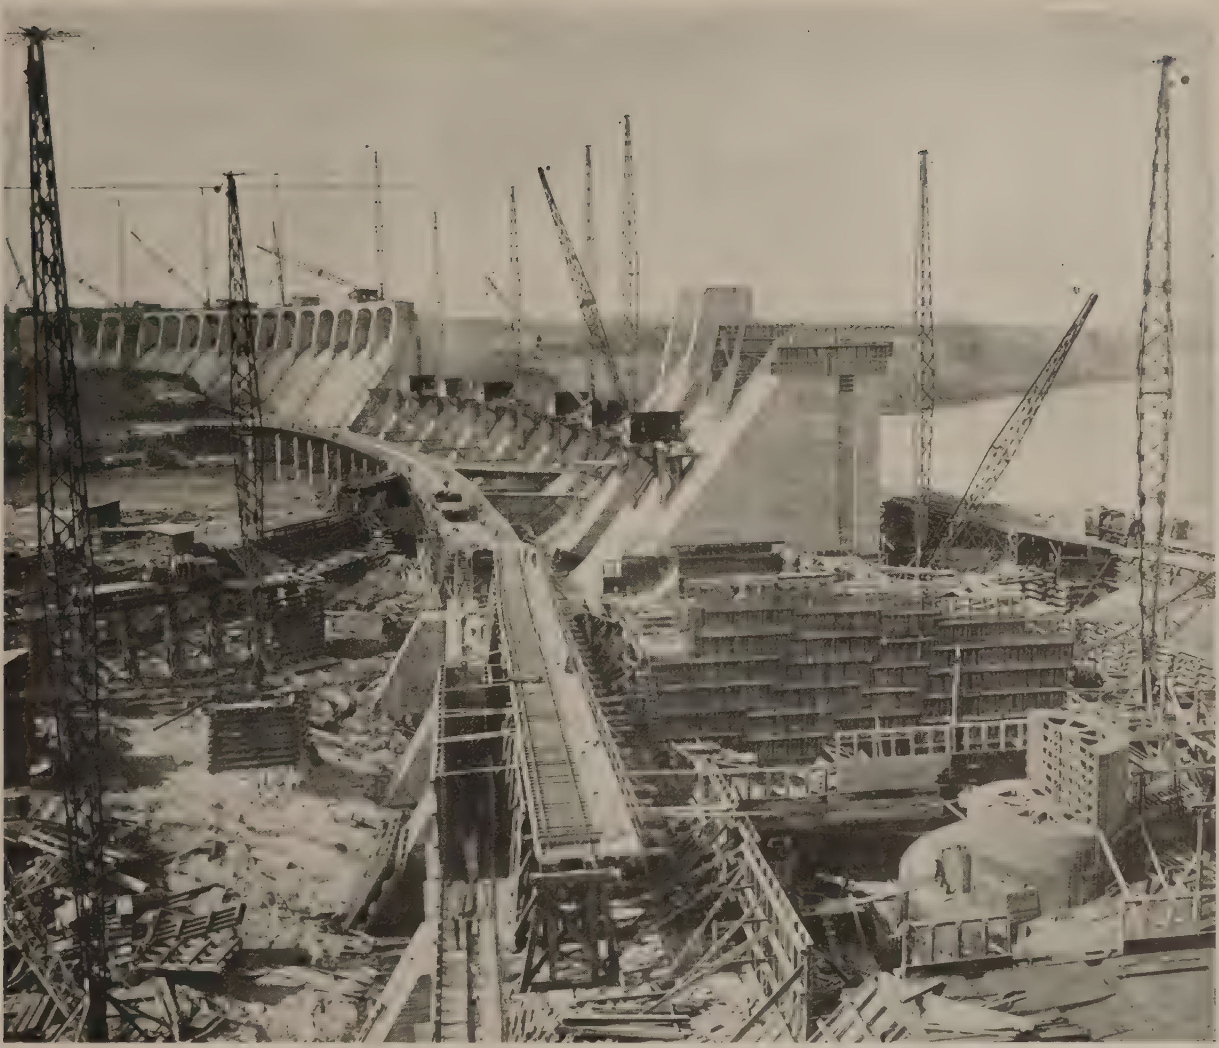
STOCK SALES
To Customers and Employees
(By Years)





JORDAN DAM (ALA.) PLANT TO CONTAIN FOUR 29,000-KVA. UNITS

# $273,000,000 for 1928 Stations

About 3,000,000 kva. to be added to utility generating capacity. Building of plants to occur in all regions. West coast goes to steam stations.

SERVICE demands in the light and power industry increase at a rate that calls for the addition of more than a million kilovolt-amperes to generating stations each year. Budget reports indicate an expenditure in 1928 for power stations aggregating $273,000,000, as compared with $235,000,000 in 1927. The 1928 expenditure will be $183,000,000 for steam plants and $90,000,000 for hydro plants.

Power-plant building occurs in all areas. In several large metropolitan systems the program for 1928 calls for additions to existing stations. In regions of heavy load density new stations are contemplated and in areas where transmission-line building has been active large stations are built to supply the system. With the extension of transmission systems small and inefficient stations in small towns become stand-by or peak-load plants and the bulk of the energy is supplied from large, efficient plants. A striking development for 1928 is the program for building many steam stations on the Pacific Coast and in the South—regions noted for waterpower resources. Two reasons exist for this trend, the chief one being costs and the other being the need for a local power supply to insure reliable service to metropolitan communities served by transmission systems.

Under federal waterpower license a total of 680,826 hp. is scheduled to go into operation in 1928, as compared with 91,194 hp. in 1927. Other large hydro projects are contemplated for the South, and the Conowingo development should start operations. Waterpowers which can be developed economically continue to be in favor, and several large projects await development only because of political or other restrictions.

The accompanying tables give a detailed analysis of power-station building programs for each location, but does not contain certain large stations for which preliminary plans are made and which will be started in 1928. Evidence is available to show that 1928 and 1929 will be very active in power-plant building.

# What of the Future

## *In Producing Electrical Energy from Heat Sources*

By J. C. Parker
*Vice-President Brooklyn Edison Company*

J. C. PARKER

IN ATTEMPTING to forecast improvements in the cost of production of electrical energy from heat sources, a person is tempted first to think about new and weird cycles. While not discounting the opportunity for improvement in these spectacular ways, I am convinced that the big improvements in the next few years will come through more pedestrian enterprise.

Progressively the last ten years have seen stage bleeding, air preheating, economizers and intelligent uses of auxiliary steam come into their own. Water walls and preheat cycles have progressively advanced the economy of steam-power production. We don't hold our breath now when one talks of steam pressures of 1,500 lb., and evaporation at the critical point is just around the corner—reduced to practice on the continent of Europe. At Hartford the mercury cycle has shown itself to be operatively feasible and the use of diphenol oxide has alluring possibilities with all the evidence of being probably practicable.

Strangely enough, most engineering effort has been devoted to the top of the cycle with but little attention to the low temperature end except for sporadic attempts at the use of exhaust steam in certain evaporation processes. I say strangely enough, because the present lost latent heat of vaporization represents by far the biggest part of the heat taken from the boiler room. There is in my mind no question that intelligent economic research will sooner or later find a balanced process wherein this latent heat can be salvaged and our large generating plants correspondingly operated noncondensing.

Engineers who view the significant improvement in combustion brought about during the past few years must recognize that, brilliant as are the developments that have taken place, they shine only by comparison with the work of previous years. The present status of the combustion art is a long way from the ultimate. As an extreme possibility in this connection it may be pointed out that there is a sister industry which buys fuel in large quantities, prepares it for gaseous distribution and has huge quantities of solid byproducts. Clearly, from the combustion viewpoint, there should be considerable and significant possibilities of economy in the cooperative development of gas works, electric supply stations and exhaust steam utilization.

These are things to dream about, or, better, actively to study. Close at hand, however, we have the possibility of design and management improvement following our present basic methods of energy production.

The cost of energy delivered on to the bus depends on three things—investment cost, over-all efficiency and operation management. Great strides have been made with the second of these, so far as concerns the individual unit. I seriously question whether the same skill has been devoted to the development of system efficiency. Most of us, for example, consider the beautifully efficient base-load unit as a thing which has its place on the big interconnected system. What could be accomplished were the companies which operate detached from such systems definitely to design peak-load units primarily with reference to low first costs almost irrespective of operating efficiency with the idea that other units might be operated at load factors approximating 100 per cent and correspondingly designed for the maximum efficiency attainable? Could not the total cost of production significantly be lowered? We have habitually devoted most of our attention to our newer constructions with but little thought to the problem of complete utilization of our older stations as spare or emergency capacity, in spite of the fact that such treatment of the older equipment would enable at once the preponderance of generation by the more modern and efficient equipment and the saving of new construction expenditure.

In spite of the appearance that engineers and operators display when on dress parade, the substantial fact is that we are woefully ignorant of the things that we can do operatively with our equipment, once installed. For example, to obtain a high system economy it is absolutely essential that the least economical equipment be held available for emergency purposes only, yet there is absolutely no quantitative knowledge in the industry or fundamental understanding even of the sequence of events ensuing on the sudden throwing of load on to such stand-by equipment. Operating management is then necessarily curtailed in most fully realizing the best that can be had from the equipment installed. A fraction of

*Total Energy and Fuel-Generated Energy in Public Utility Plants in the U. S. 1919-1927*

Including electric light and power, electric railway, Bureau of Reclamation and certain other plants generating energy for public consumption:

| Year | Kw.-Hr. Generated in all Public Utility Plants (Millions) | Kw.-Hr. Generated from Fuel (Millions) | Coal Consumed (Thousands of Tons) | Coal Equivalent of all Fuel† (Thousands of Tons) Total | Pounds of Coal per Kw.-Hr. |

*Estimate based on ten months' operations.
†Includes oil and natural gas.

the effort which has gone into design development if devoted to operating management research would produce most significant improvements in the steam-generating art.

Granted the most advanced cycle, system design for high efficiency and fundamentally sound operating management, there still remains room for improvement in capital costs. We cannot expect any enormous reductions in the first cost of our turbine equipment or in the boiler equipment per unit of capacity. However, we are learning to use the installed boiler room capacity for duties which a few years ago would have been undreamed. Only yesterday one heard of a boiler being operated at 700 per cent of nominal rating, and the question naturally arises as to when we will throw nominal ratings overboard entirely. Such developments as the result of water-cooled walls and powdered fuel are in the spectacular class, but there is even more significant improvement of capital cost to be had in the detail layout.

Designers have exercised a fiendish ingenuity in pyramiding valves and piping systems, switches and relays and academically exquisite schemes to obtain efficiencies which no routine operation ever could attain because the technical complications have jeopardized reliability.

All great art has distinguished itself through simplicity and straightforwardness of conception and boldness of execution. Admirable as have been the engineering advances in power plant design, it is questionable whether they have been distinguished in this sense. Complication of design not only causes excessive initial cost, but demands labor crews and supervisory effort that may easily be way out of proportion to the paper gains expected. In his entire professional career the writer has never yet discovered that thoughtful simplification did not result in greater dependability and higher economy of operation.

In attempting to predict the immediate future of the steam-generating art, one would be bold, if not foolish, to attempt to say which element will produce signal improvements and to what extent. Could that be done to any degree of certainty, the future would already have become present. However, it is hoped that the foregoing may indicate that the production of electrical energy from the heat of combustion has not attained anything approaching full development but rather that the ensuing few years will produce not only more kilowatt-hours per pound of fuel but even more significantly more kilowatt-hours per dollar expended. The unique attainment of the electrical industry—pushing down the price of its commodity in the face of increased costs for all other elements in living—is going to continue almost without limit into the future.

### *Conowingo Interconnection*

*Right*—The 400,000-kw. Conowingo hydro station of the Philadelphia Electric Company.

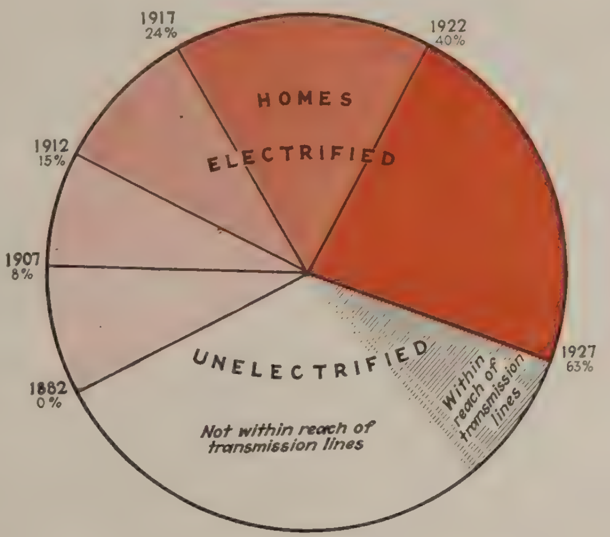
*Below*—Plymouth Meeting substation will interconnect 220-kv. lines of the Pennsylvania Power & Light Company, Public Service Electric & Gas Company and Philadelphia Electric Company.

*Lower Right*—Two lines of these towers carry 220-kv. circuits from Conowingo to Philadelphia.

# 21,694,000 Customers

More than 1,500,000 added in 1927. Residential customers increase by 1,237,000 to nearly 17,600,000. 63 per cent of American homes now served. Rate of growth 7.5 per cent. Peak of increase has been passed

THE beginning of 1928 finds the electric light and power industry serving 21,694,100 customers, classified into 17,596,400 residential, 3,166,570 commercial and 931,140 industrial power users and others. The last-named group includes some miscellaneous customers not listed by companies reporting under any one of the three major classes, but their number is relatively small.



SIXTY-THREE PER CENT OF HOMES ARE ELECTRIFIED. 23 PER CENT SINCE 1922

The net increase during the year 1927 is estimated at 1,515,569, divided into 1,237,111 residential, 203,160 commercial lighting and 75,298 others. The rate of increase was approximately 7.5 per cent; slightly lower if all classes are considered together; a trifle higher for domestic customers alone.

Although individual companies reported gains far in excess of the national average, the greatest regional gains, both numerically and in per cent, occurred in the Middle Atlantic group of states; the rate of growth in that section was 9.4 per cent, rising to nearly 10 per cent in New York and somewhat higher in New Jersey. As in previous years, the influence of the metropolitan area is marked.

The table of customers on page 66 has been critically revised, in the light of all available sources of information. It embodies the results of special surveys, of data collected throughout the year and of much correspondence with all authorities in the various states from whom authentic data might be had.

The returns for 1927 corroborate the inference drawn from similar statistics in recent years: the period of maximum increase in number of customers has been passed; growth from now on will probably be more and more gradual. Residential customers constitute by far the largest group numerically—about four-fifths of the total—and since the number of those using electricity is approaching two-thirds of all the homes in the country, it is reasonable to suppose that the rapid increase observed a few years ago could not long continue.

It might be urged that the data are not entirely homogeneous; customers, consumers, number of meters and number of open accounts are variously reported when an effort is made to ascertain the number of light and power customers. These terms are not equivalent, but the data thus gathered are the best to be had at this time; while the differences would no doubt preclude a fair comparison of the operations of certain individual companies, the effect on state and national totals is not great. Some of the errors tend to balance out, and the resulting figures represent the number of families, of business places and of power-consuming establishments with reasonable accuracy for practical purposes.

Assuming, then, that a residential customer is substantially equivalent to a family electrically served, and basing the estimated number of families on census statistics for the year in question, it appears that nearly 64 per cent of our national population now have central-station service in their homes. This excludes isolated plants not classed as public utilities, in particular farm-lighting sets which are estimated at 350,000.

In the past the net increase in customers has far outrun the growth in population. The turning point appears to have been reached in 1924; the gain that year was about 2,000,000 customers of all kinds. In the next three years it was successively, in round numbers, 1,700,000, 1,700,000 and 1,500,000. The residential growth presents the same picture, only the figures are a little smaller — namely, 1,600,000, 13,500,000, 13,500,000 and 12,400,000, respectively, again in round numbers.

The accompanying table summarizes the changes that have taken place in twenty years. The electrical industry was by no means insignificant in 1907, but in retrospect the figures of that day look small. In two decades the increase in customers has been more than tenfold. The number has trebled in a decade.

Data for the earlier years are reprinted from the United States Census of Central Electric Light and Power Stations. Those subsequent to 1922 have been critically revised in the light of the best available information. In addition to statistics received directly through the co-operation of the companies themselves, generous assist-

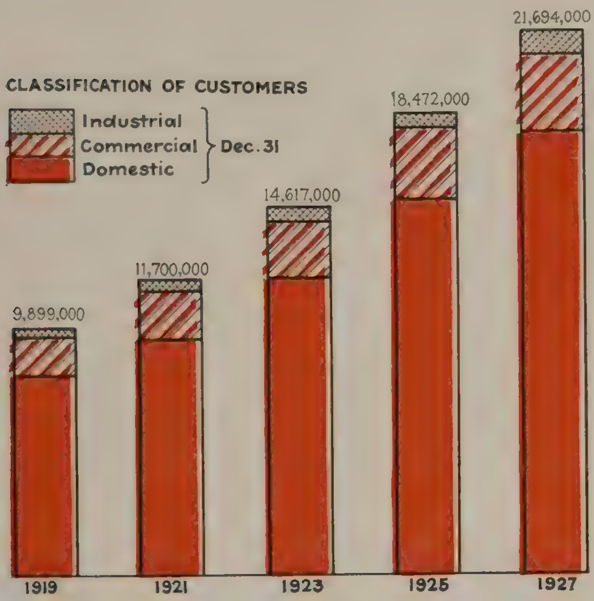
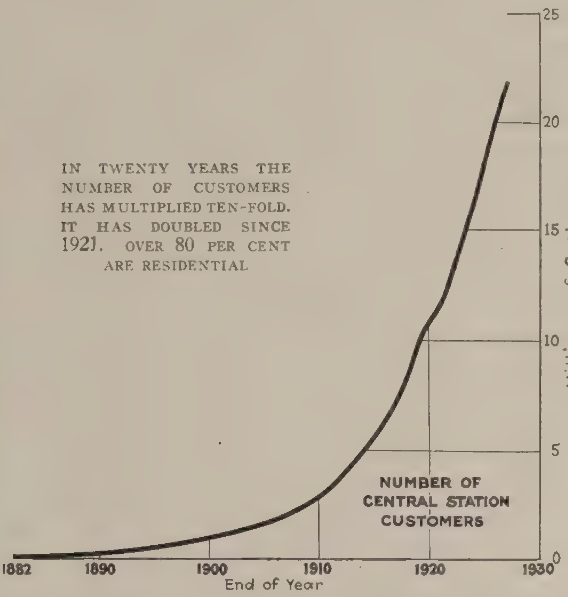
*Includes District of Columbia. †Includes Delaware and District of Columbia ance has been rendered by the public utility commissions of many of the states and by committees on public utility information. Credit for new figures is indicated in the table. Where official figures were obtainable, they have been substituted for the ELECTRICAL WORLD estimates previously published, except where they were known to be incomplete. A number of state commissions were able to give data for private companies, but had no jurisdiction over municipal operations, so that data had to be combined.

In most instances the changes thus introduced were surprisingly small. The net result was an upward revision of about 2 per cent, evidence of the successful operation of the policy of estimating as accurately as possible, but of leaning toward the conservative side wherever judgment had to be exercised in interpreting data. The diminishing margin between the number of potential and of actual customers, particularly in the residential field, shows the growing need of developing greater use per customer, if growth is to continue.





# Water Power of the World

THE DEVELOPED water power of the world, according to estimates made by the United States Department of the Interior through the Geological Survey, was about 33,000,000 hp. at the end of 1926, an increase of 43 per cent in six years. It was 23,000,000 hp. in 1920 and 29,000,000 hp. at the end of 1923. About three-fourths of the increase for the last three years has been in the English-speaking section of North America. Europe made a brief spurt during and after the World War but has now slowed down appreciably in its construction of hydro-electric power plants.

It is difficult to co-ordinate estimates of water power for the several countries, particularly estimates of potential water power, because of differences in their elements and character and in the completeness and accuracy of the data on which they are based; but the estimates here given are considered sufficiently accurate to afford a rough idea of the potential water-power resources of the world and the extent of their development. The figures for the developed water power represent the rated capacity of water wheels or turbines installed, and the figures for the potential power represent the total power that could be obtained at ordinary low water, including the power already developed. The installed capacity usually amounts to from two or three times the power available at low water.

In the accompanying tables the potential power for the United States represents the power available 90 per cent of the time at 70 per cent efficiency.

TABLE I—SUMMARY OF POTENTIAL AND DEVELOPED WATER POWER IN NORTH AMERICA BY COUNTRIES (1926)

| Country | Horsepower | |
|---|---|---|
| | Developed | Potential |
| Mexico | 300,000 | 6,000,000 |
| United States | 11,721,000 | 35,000,000 |
| Alaska | 43,000 | 1,000,000 |
| Newfoundland | 160,000 | 400,000 |
| Canada | 4,556,000 | 18,250,000 |
| Costa Rica | 15,000 | 1,000,000 |
| Guatemala | 4,000 | 1,500,000 |
| Honduras | 3,000 | 1,000,000 |
| Nicaragua | 400 | 800,000 |
| Salvador | 2,700 | 200,000 |
| Panama | 13,300 | 500,000 |
| West India | 19,350 | 150,000 |
| Total | 16,837,750 | 65,800,000 |

TABLE II—WATER POWER RESOURCES OF CONTINENTS

| | Developed Hp. | Potential Hp. |
|---|---|---|
| North America | 16,800,000 | 66,000,000 |
| South America | 750,000 | 54,000,000 |
| Europe | 13,100,000 | 58,000,000 |
| Asia | 2,100,000 | 69,000,000 |
| Africa | 14,000 | 190,000,000 |
| Oceanica | 240,000 | 17,000,000 |
| Total | 33,004,000 | 454,000,000 |

# News of the Industry

## State Commissions to Oppose Walsh

### Their Representatives Expected to Object to Federal Investigation of Companies Regulated by Them—How Muscle Shoals Bills Shape Up

By Paul Wooton
*Washington Correspondent of the* Electrical World

BEFORE considering the action it will take on the Walsh resolution, which proposes a minute inquiry by a special committee of the Senate into virtually every phase of the public utility business, the committee on interstate commerce, as already reported, plans to hold public hearings, to begin Jan. 16. Apparently it will be developed at these hearings that the state public service commissions will not be in accord with the Walsh proposal. The feeling among the state utility commissions, it was stated at the headquarters of their association in Washington, is that there is no need for additional regulative machinery. They look upon the utilities as essentially local enterprises. To have the federal government concerning itself with electric power and gas, of which only a small proportion of the total moves interstate, seems to them an instance of the tail wagging the dog.

At the hearing it is expected that witnesses representing the state commissions will emphasize the position that the matter is one of state rather than federal concern. It will be pointed out that the utilities, including the holding companies and their earnings and securities, are subject to the plenary power of the states, which is being exercised effectively. It will be emphasized that the states have not sought the proposed investigation and that no reason exists for the transfer to Washington of complaints which in the usual course would be taken up by the state commissions. It is expected also that some of the executives and other officers of the power companies will answer Senator Walsh's charge of overcapitalization of the industry and exorbitant rates to consumers.

One of the points which will be brought out at the hearing is the almost unlimited scope of the proposed investigation. It would include banks, insurance companies, educational institutions and other concerns affiliated with companies owning public utility stocks. Engineering and construction companies, as well as financial concerns, are specifically included in the resolution, as are non-utility companies that have even remote connections with a utility.

While the committee has taken no action on the resolution so far other than to fix a time for its consideration and the probable beginning of hearings, there is no disposition on the part of any members, so far as is known, to delay a report to the Senate beyond the time necessary for proper consideration of the resolution. Under the procedure the committee may report the resolution favorably or unfavorably, or may report it recommending its passage in an amended form. If the committee should accept the view taken by the representatives of the state commissioners as indicated at the offices of the association of commissioners here, the tendency undoubtedly would be to restrict the proposed inquiry to the interstate business engaged in by the utilities.

One of the principal points expected to be brought out at the hearing is that the state commissions and the courts, in dealing with valuations to be made the basis of rate fixing, pay no attention whatever to the amount of capitalization of the companies or the outstanding securities. It is expected that the representatives of the power companies will categorically deny the charge of overcapitalization and will present figures sustaining their denial. At the same time it will probably be shown that the question of overcapitalization is one which affects investors rather than consumers of power, inasmuch as the commissions and the courts nowadays totally disregard such questions in fixing rates.

Judging from the language of the Walsh resolution its proponents are not willing to accept the determinations of the state authorities. This is a factor in the proposed investigation that is sure to claim the attention of the leaders of an administration pledged to economy. The cost of checking the underlying data of capital issues aggregating $9,500,000,000, of evaluating the even larger and more intricate property accounts, to say nothing of the analysis of the corporate structure of more than a hundred holding companies, would be great. In view of all of this it is not thought likely that the committee will approve the resolution in its present form.

The fact that the Potomac Electric Power Company has reduced its rates 41 per cent in the last three years in the city which is the residence of national legislators during the sessions of Congress should have an important bearing on the proposed investigation of the electric industry, officials of the Potomac company think. They feel that the conduct of the electric utility in the national capital has been of such a character as to create a good impression among members of Congress, and it is pointed out that the household rate in Washington is among the lowest in the country and is lower than that in Buffalo, where hydro-electric power is available. The low rates prevailing in Washington are in spite of the stringent local regulations, which require the almost exclusive use of underground conduits.

#### Three Muscle Shoals Bills

To bring up to date the Muscle Shoals situation as it presents itself to Congress, it may be still of interest to make it clear that a bill is being prepared to put into legislative form the recommendations of the President and of the Secretary of Agriculture for the disposition of Muscle Shoals. While the exact provisions of the bill have not been announced, it is understood that they will call for the sale of the power at a reasonable price and the use of the funds thus received in conducting experiments in the production, distribution and use of concentrated fertilizers.

Two propositions are now pending in Congress. One, by Senator Norris, is before the Senate committee on agriculture. It is essentially a government operation and ownership plan both with respect to fertilizer production and generation, distribution and sales of power. It authorizes appropriations for additional power equipment that would cost perhaps $15,000,000. Pending before the military committee of the House is a bill by Congressman Madden authorizing the execution of a contract with the American Cyanamid Company for a fifty-year lease of the Muscle Shoals properties on condition that the United States expend an additional sixty-five or seventy million dollars for building two additional power plants, one at dam site No. 3 and the other at the Cove Creek site near Knoxville, Tenn. The contract proposes that the lessee shall engage in fertilizer production on various stipulated conditions. Mr. Madden has just issued a statement calling attention to the fact that no less than 63 "improvements" have been incorporated in the bill by agreement between the committee and the American Cyanamid Company and declaring: "As the legislation is now drawn it is my judgment that it represents a most effective instrument for securing to the country those benefits to national defense and agriculture which we sought to secure when we passed the national defense act in 1916."

Each of these measures—the Norris bill and the Madden bill—will provoke strong opposition in both houses.

# Governor Smith Reiterates Power Views

### But Suggests that His Desired Power Authority Prove the Economic Soundness of Its Plan Before Legislative Sanction Is Given

GOVERNOR SMITH in his eighth annual message to the New York State Legislature, submitted on Wednesday of this week, renews his request for the establishment of a New York State Power Authority, but he has again shifted his position somewhat in that he suggests that such authority when created prepare a comprehensive plan dealing with the production and distribution of hydro-electric energy which before any development would be undertaken would be written into the statutes by the Legislature in the same manner that a comprehensive plan for the development of the port of New York was enacted in detail in the law giving that body power to function.

In respect to power development the message says in part:

> In 1921 the Legislature saw no obstacle to the setting up of the Port of New York Authority, and to the approval of a comprehensive plan for the development of that port which, when carried into effect, will cost upward of three hundred million dollars. Even more recently the Legislature did not oppose amending that plan and conferring upon the Port Authority the power to issue its bonds for the construction of bridges between New York and New Jersey, to cost more than one hundred million dollars. All of the bonds sold for the progress of this great public work have been offered to the public upon the basis of the ability of these improvements to earn interest and sinking fund charges.
>
> What is the difference between a joint undertaking like the development of the Port of New York and the construction of these bridges and the development of water power at sites now in possession of the people of the state? I see none. In fact, I am convinced that the economic worth of such development can be as easily demonstrated to prospective bondholders as can the economic worth of the developments at the Port of New York. Moreover, I have such confidence in this method of financing that I believe that unless and until such economic proof is forthcoming, no move should be made by any authority set up by the state to offer its bonds to the public.
>
> Following, therefore, the charted path and taking a lesson from actual experience, why should we not set up in this state a New York State Power Authority which would be a public corporation, municipal in character, having no stockholders, deriving its powers from the state and having duties specifically imposed upon it to take over and develop the power resources of the state? Such a corporation should be given the power to issue bonds exempt from state taxation and secured by the revenues to be derived from the improvements when made.
>
> The Power Authority should be directed in the first instance to prepare a comprehensive plan for the development of our water-power resources and submit it, with the economic proof of its soundness, to the Legislature just as the Port Authority submitted its proposals to develop the Port of New York. . . . Should it develop that they were unable to prove the economic soundness of any plan they may propose, it will remain within the power of the Legislature to reject the plan and the question will be definitely settled for all time. But, before the fact is established, to alienate the resources, to lease them to private control for a lifetime, would be a deliberate and willful waste of a great God-given resource that should be developed in the interest of the people.
>
> The question of water-power development at the present time is receiving nation-wide attention. Giant power combines naturally will stand against the proposal of a public authority, but it is difficult to be in sympathy with their viewpoint because it is purely selfish. On the other hand, there is today an insistent and growing demand for the development of these power resources by the rightful owners—the public themselves. . . .
>
> There is one sure way to get the full benefit of hydro-electric energy for the small storekeeper, the small home-owner and the people on the farm, and that is to have the state retain the ownership not only of the source of the power but of the development works. The comprehensive plan prepared by the Power Authority can deal with the distribution after study and research. It will have to be a part of the plan, which in turn will have to receive legislative approval before it can be effective. No harm can come to the state by a trial along the same lines already adopted for other great public developments by means of such an authority. Nobody can honestly and conscientiously oppose it unless they belong to that reactionary Bourbon group who are against public ownership or public development of any resource.

After referring to the two state-owned hydro-electric plants on the Barge Canal, the Governor concludes:

> There are but two roads upon which we can travel. There is no middle course. We must either take a chance and lease these properties for a term of years, which really means giving them away with the possible right of recapture after we are all dead and gone, with all the consequent litigation attendant thereon, or declare for ourselves at once, retaining not only our full and complete ownership of these properties but the right to make contracts at rates favorable to the real owners of the power—the people of the state.

### PUBLIC UTILITY REGULATION

Upon the subject of public utilities the message repeats recommendations of former years, saying:

> All along I have stood for the right of a locality to regulate a public utility operating wholly within its borders upon the theory that the service is being rendered to the people of a single city and the elected officials of the city are held responsible in the first instance. The people look to them and not to the state. Further, local officials have been prone to blame the state when service and rates are not what the people believe they should be.
>
> There is also no reason why the state should not delegate its police power for the regulation of public utilities to the properly elected officials of a municipality. There are many cities in the state which may not desire that power. In order not to infringe upon their home-rule prerogatives, it might be well to frame a statute in such a form that it would require the municipality to take an affirmative stand and by resolution of its local common council seek permission to exercise the state's authority over public utility corporations entirely within its corporate limits. In the absence of a specific request, the control should remain with the state.

---

# New York State Mayors Ask for State Hydro Power

The New York State Conference of Mayors, sometimes called the "third house" of the Legislature, meeting last week, recommended that the Legislature provide for the state development of undeveloped hydro-electric power. It will supplement the Governor's message by sending to the Legislature its recommendations. Regarding utility legislation, the conference says:

"We urge the Legislature to enact legislation of a permissive character which will give to the municipalities the right to acquire, construct, own, lease and operate within or without their corporate limits any public utility, product or service which is or is to be supplied to the municipality or its inhabitants, or to enter into contract for such product or service."

---

# High Bridge Plant at St. Paul Meets with Accident

Referring to press reports of an explosion in the plant of the Northern States Power Company in St. Paul on the afternoon of Jan. 3, Robert F. Pack, vice-president and general manager, made the following statement:

"Shortly before 3 o'clock in the afternoon of Jan. 3 there was a flashover in generator No. 2 at the High Bridge station, putting this unit out of commission. With the exception of very minor injury to two employees, no persons were injured and no damage was done to any property other than the company's. The plant was slightly damaged by fire, and there was an interruption in some sections of St. Paul for approximately half an hour. Speedy resumption of the service was made possible owing to the interconnection of different plants of the Northern States Power system into the power loop that surrounds the Twin Cities. There is ample generating capacity to supply all requirements until repairs to the damaged generator can be made."

---

# Central Maine Power Reports Excellent Outlook

Further expansion of the Central Maine Power Company system is now under way after the best year in the history of this utility. In a statement made on Jan. 1 President Walter S. Wyman said that work has begun on the 5,500-hp. hydro-electric station to be built on the Androscoggin River at Deer Rips. It is expected that the new Deer Rips plant will be completed next fall.

During 1926 the company supplied service to more than 600 additional rural homes and also established a new schedule of rates in several districts which will save its customers substantial amounts. Work is being pushed at top speed in the construction of a 110-kv. line, the first in the state, from Lewiston to Windsor and from Rockport to Thomaston, principally for supplying power to a new cement plant in the latter town. Mr. Wyman says that the chief regret of 1927 is that favorable action upon the exportation of surplus power from the state was withheld by the Legislature.

## Purchases and Mergers

*H. C. Orton of Interstate Power Explains Further the Coming Transfer of Federal Public Utilities to Utilities Power & Light*

PLANS for the purchase (alluded to under this heading last week) by the Utilities Power & Light Company and other interests of the holdings of the Federal Public Utilities Company, which include the Northeastern Iowa Power Company, formerly owned by Davenport interests, have been explained by H. C. Orton, Dubuque, vice-president and general manager of the Interstate Power Company, a subsidiary of the Utilities Power & Light. Mr. Orton said that the transaction has been pending for some time and that its consummation is now only a matter of time. That the purchase will include the merging of the Northeastern Iowa Power Company with the Interstate Power Company was denied by Mr. Orton, who stated that the plan is to operate all of the Federal Public Utilities Company's holdings as a separate unit. Mr. Orton will continue as vice-president and manager of the Interstate company, and the administrative offices of the new chain of utilities will also be in Dubuque under his direction.

The properties involved, which, as previously announced, have a valuation of approximately $15,000,000, include, besides the Northeastern Iowa Power Company, the Central Light & Power Company of North Dakota, the Southeastern Missouri Public Service Company, the Missouri Power & Development Company, the Arkansas Public Service Company and utility companies in Oklahoma, Texas, Alabama, Louisiana, Michigan, Minnesota and New Brunswick, Canada.

The United Gas Improvement-Philadelphia Electric Company merger will become effective Feb. 14, according to announcement by the special committee of stockholders.

Interests usually associated with Charles H. Tenney & Company, Boston, have made an offer of $125 per share for the stock of the Gloucester Electric Company, serving the Cape Ann district of Massachusetts. Outstanding shares total 20,500 of $25 par value. About 35,000 in population is served by the company. The Tenney interests quite recently enlarged the sphere of their operations by acquiring the Newburyport company and merging it with the Haverhill Electric Company.

The Pennsylvania Edison Company of Easton, Pa., has acquired the Saylorsburg (Pa.) Light & Power Company. Both are General Gas & Electric properties. The Monongahela-West Penn Public Service Company, Fairmont, W. Va., is negotiating for the purchase of the Webster Springs (W. Va.) Electric Light Company.

A certificate merging the Portville Utility Company with the Niagara, Lockport & Ontario Power Company has been filed at Albany, N. Y.

A certificate has been filed in the office of the Secretary of State at Albany merging the Lebanon Valley Lighting Company, Katonah Lighting Company, Amenia Electric Light & Power Company and Morgan Valley Electric Light & Power Company with the Harlem Valley Electric Corporation.

Taxpayers of Yuma, Colo., at a special election on Dec. 27 voted 141 to 53 against the selling of its municipally owned electric light plant to the Commonwealth Utilities Corporation for $90,000.

Application of the Otter Tail Power Company to purchase the electric property at Great Bend, N. D., from the Great Bend Light & Power Company has been approved by the North Dakota commission. The General Service Company has been authorized to buy the electric property at Sanish from J. E. Brusel.

Purchase of the light and power plant at West Fork, Ark., is announced by officials of the Southwest Power Company, McAlester, Okla. The plant will be connected with a transmission line from Fayetteville.

The Southern Indiana Light & Power Company, of which Henry F. Clevenger of Columbus, Ind., is president, has bought the Winterrowd Electric Company holdings at Flatrock.

The Inland Utilities Company is reported negotiating for purchase of the municipal electric light plant and waterworks at New Albany, Miss.

An offer to pay $3,500,000 for the power and distribution plant and the railway at Saskatoon, Saskatchewan, and to divide net profits from their operation with the city has been made by the Dominion Electric Light & Power Company, New York.

Indorsation of the Public Utilities Board of Nova Scotia for a merger of four Annapolis Valley light and power companies into one, to be known as the Annapolis Valley Electric Company, Limited, is being sought. The companies are the Lawrencetown Light, Heat & Power Company, Paradise West Electric Company Bridgetown Electric Light, Heat & Power Company and the Bear River & Digby Electric Light, Heating & Power Company.

## Philadelphia Electric's New Building Illuminated

From his home in West Orange, N. J., Thomas A. Edison on New Year's Eve, by tapping a telegraph key, sent an impulse over 90 miles of Western Union wire that inaugurated the floodlighting of the Edison Building, at Ninth and Sansom Streets, Philadelphia—the Philadelphia Electric Company's just completed office building. The upper nine floors of the 22 that the building contains were painted all the colors of the rainbow.

This floodlighting is to continue daily. It is unusual in that moving colors have been used. The spectacle on New Year's Eve showed two of the primary colors in use, red and green, in honor of the Yuletide season. These two colors were shot along the nine upper floors. Green was used along the lower floors and red on the top. White lights were thrown against these, and during the cycle of a half minute every shade in red and green, from a delicate violet to a rose pink, was seen.

## Furnace Uses a Million Kw.-Hr. Monthly

*Milwaukee Electric Railway & Light Makes Installation for Its Largest Industrial Customer to Serve Heat-Treating Unit of Great Size*

WHAT is asserted to be the largest resistance-type electric heat-treating furnace yet manufactured has just been placed in operation by the A. O. Smith Corporation, the Milwaukee Electric Railway & Light Company's largest industrial power customer. The furnace is rated at 3,000 kw. and will use in the neighborhood of 1,000,000 kw.-hr. per month under normal operating conditions. Large oil-refinery stills or vessels weighing as much as 175 tons each will be heat-treated or annealed in the furnace, where the temperature will be maintained at a maximum of 1,650 deg. Fahr. The oil stills are charged into the furnace on special sand-sealed-type furnace cars 12 ft. wide and 70 ft. long.

The furnace is heated by means of heavy cast-nickel-chrome-alloy T-grid heating elements in the side walls of the furnace chamber. The heating elements are divided into six separate circuits, each of which is separately and automatically controlled. Provision has been made by means of special transformers to vary the rate of power or heat input into the equipment over a wide range. The complete furnace installation takes up a floor space approximately 20 ft. wide and 250 ft. long. The heating chamber, car transfer pit and cooling chamber are each 80 ft. in length.

Three 1,000-kw. single-phase transformers connected in closed delta for taking energy at 26,000 volts, three-phase, are used for supplying energy to the furnace. These transformers are contained in an outdoor-type substation which is 12 ft. wide and 60 ft. long. The substation was designed by the distribution engineering division of the Milwaukee company and installed by the installation division of the electric distribution department. The underground division of the same department installed the 26,000-volt underground cables and conduits to the substation. The furnace was designed by and erected under the supervision of the Electric Furnace Company of Salem, Ohio, which also furnished the complete electrical equipment and material necessary for constructing the furnace or heating chamber. The A. O. Smith Corporation designed and built the cooling chamber and the cars and car transfer mechanism.

# Briefer News

COLUMBUS, OHIO, WILL ADD 16,000 STREET LAMPS TO ITS SYSTEM.—To improve the city's street lighting system in the coming year, the Columbus (Ohio) City Council has authorized the purchase of 16,192 additional electric lamps.

SAND SPRINGS (OKLA.) POWER COMPANY HAS PROGRAM OF EXPANSION.—A program for expansion, in which $2,500,000 will be expended by the Sand Springs (Okla.) Power, Light & Water Company, has been announced by E. M. Monsell, vice-president. "While the time for the announcement may be somewhat premature," he is quoted as saying, "the $2,500,000 will be ultimately spent."

INCREASED VOLTAGE HELPS BUFFALO SUPPLY OF ENERGY.—Substation No. 2 of the Buffalo General Electric Company has been changed over to handle power at higher voltage. Formerly receiving its power supply from Terminal B at 11,000 volts, it now is supplied from Terminal D at 22,000 volts. The change has enabled the station to serve an increasing industrial area without any interruption of power service.

UTILITY COMPANY'S PROTEST BRINGS BIG TAX REDUCTION. — Suits brought by the Northern Ohio Power & Light Company, Akron, Ohio, in the federal court at Cleveland enjoining the collection of the 1925-26 utility taxes in Summit and other counties of Ohio have been settled out of court. Under the settlement the company saves about $125,000 on its Summit County taxes for the two-year period involved. The Northern Ohio contended that its property was listed for taxation at virtually its full value, while other property was listed on a basis of 40 to 50 per cent. The utility company made it plain that it had no desire to evade its taxes, but maintained that the valuation of its property should be reduced or the valuation of other property be raised.

NEW HYDRO PLANTS ON UPPER NEW YORK STREAMS.—The Northern New York Utilities, Inc., will have a market this year for 24,500 additional horsepower, according to General Manager H. G. Davis. The company owns power houses on the Raquette, Beaver, Black and Oswegatchie Rivers. A total of 17,000 of the extra horsepower was taken on Jan. 1 by the St. Regis Paper Company for operation of its mills at Norfolk, Norwood and Raymondsville, all on the Raquette. The rest will be used by the Rome Brass & Copper Company in the operation of a new plant. Jan. 15 will see the completion of power plants at Raymondsville and Norfolk, the former to develop 3,000 hp. and the latter 5,000 hp. A 5,000-hp. plant at Norwood will be finished about Feb. 1, and a plant at East Norfolk of 7,000 hp. some time later.

OLD CINCINNATI RATES SUSTAINED IN LOCAL COURT.—The dispute over rates in Cincinnati has brought a decision in the Common Pleas Court overturning that of a master commissioner and directing the company to re-establish the 1925 rate which the city had endeavored to supersede by new ones designed to save consumers $750,000 a year. (See ELECTRICAL WORLD for Oct. 29, page 904). The Common Pleas Court found a referendum petition on the 1925 rates illegal and the Council's action void. The company charges confiscation and has a suit pending in the federal courts. The city will appeal from the local court's decision just noted.

BOSTON EDISON TALKS WITH, NOT AGAINST, TIME.—By adding a motorgraph talking sign to an illuminated electric clock which has occupied a conspicuous place in the Back Bay district for many years, the Edison Electric Illuminating Company of Boston has enhanced popular interest in its service. The message of the sign can be read for over a half-mile, and the installation now contains 6,300 15-watt and 2,260 25-watt lamps, the larger size being used in the motorgraph message. This clock weighs 17 tons, is 58 ft. high x 54 ft. wide, has numerals 5 ft. high and minute and hour hands 18 ft. and 14 ft. long respectively.

DETAILS OF NEW COLUMBIA RIVER PROJECT. — Preparatory steps for the seven-million-dollar development projected for the generation of 50,700 electrical horsepower for mining and manufacturing purposes have just been taken in Washington State by the Pend Oreille Lead & Zinc Company of Spokane. An appropriation of 7,000 sec.-ft. of water from the flow of Clark's Fork of the Columbia River is asked for this development, which would be located within the town limits of Metaline Falls, in the northeast corner of the state just below the Canadian border, and be known as the Metaline Falls project. The development would further require 70,000 acre-feet of water storage, providing a total fall for power uses of 80 ft. The diversion dam, to rest upon solid rock formation, will be of rock-filled concrete, 110 ft. high with a top length of 400 ft. and a bottom length of 100 ft. The Clark's Fork River, draining the Pend Oreille lakes in Idaho, would be one of the chief contributory streams to the proposed gigantic Columbia River irrigation project, and because of this proposed future federal undertaking, consent of the United States government as well as of the state must be secured.

KANSAS CITY HAS NEW "WHITE WAY."—Twelfth Street, Kansas City, Mo., has just added to the nation's "great white ways" by installing 80 lamps rated at 120,000 cp. in the area between Wyandotte and McGee Streets. The old lamps had a total of only 19,800 cp. The new ones are set 19 ft. above the sidewalk. They will burn each night from sunset until 1 a.m. and will be turned on again a little before dawn.

LIVELY ELECTRICAL TIMES IN A SMALL COMMUNITY.—Roland, Iowa, a town of only a thousand souls, has held five elections in six months on franchise issues. In the latest a proposal to continue to purchase power from the municipal plant at Story City was defeated by fifteen votes. Two weeks previously a franchise was awarded to the Iowa Railway & Light Corporation by one vote. Litigation threatens to upset this arrangement, although the company immediately cut in its service.

PHILADELPHIA UTILITY OFFICIALS GATHER.—With Arthur W. Thompson, president of the United Gas Improvement Company; Samuel T. Bodine, chairman of the board; Edward T. Stotesbury, Thomas N. McCarter and about twenty other directors acting as hosts, the U.G.I. gave a reception and luncheon on Dec. 30 to the officials of Day & Zimmermann, Inc., and the Philadelphia Electric Company, both now allied with the company first named. Almost every officer and director of the three companies was present, including Walter H. Johnson, president Philadelphia Electric, and John E. Zimmermann. Better mutual acquaintance was the object of the gathering, which may become an annual affair.

TWO NEBRASKA PROJECTS.—The Niobrara Power Company, composed largely of the same group that recently developed the Northern Nebraska Power hydro-electric plant near Spencer, Neb., has been organized for the purpose of constructing a plant on the Niobrara River several miles distant. The company has not yet incorporated, but has made surveys and estimates of cost.—— Power companies serving Nebraska have named a committee of engineers to investigate the feasibility of what is known as the Tri-County project in Adams, Gosper and Frontier Counties. This development, initiated as a public ownership proposition by land owners and business men in the district, who sought to place the credit of the state behind the necessary thirty-million-dollar bond issue, failed in the Legislature. It is now proposed to carry out the plan with private capital if the project is declared feasible and a market for the energy can be found.

Rating of Iowa Falls Plant Goes to 30,000 Kw. — The Central States Electric Company has started work upon an extension of its steam turbine plant at Iowa Falls, Iowa, to cost $300,000. The first unit to be installed will be of Westinghouse make with a rating of about 3,000 kw. The plant is designed for an eventual capacity of 30,000 kw.

New Dam for the Ouachita.—Its second dam across the Ouachita River in Montgomery County, Ark., to be known as the "Couch Dam," is to be constructed by the Arkansas Power & Light Company at Ola. Soundings have been made, and the company is ready to begin construction as soon as all the necessary land is acquired.

New Orleans to Have Electrical Show.—The Electrical League of New Orleans announces that it is preparing to sponsor a Louisiana Electrical Exposition, to be held at the Delgado Trades School. It is the intention to organize the exposition on a large scale, and it will have the backing of the New Orleans Public Service, Inc. Dates set are March 5 to March 10.

Growth of Montana-Dakota Power Company. — Completion of its high-tension-line construction program for the year 1927 reveals that the Montana-Dakota Power Company has added thirteen towns to the number previously served and has built 103 miles of line. This company now furnishes electrical energy to 70 cities and towns in western North Dakota and eastern Montana through 700 miles of line. It has constructed a power plant at Glendive, Mont., and is building one south of Columbia, N. D.

New Public Service Building at Portland, Ore.—On Jan. 3 there was a public dedication of the new Public Service Building at Portland, Ore., which has been occupied since Dec. 19 by the three affiliated companies for which it was built. All but six floors of the sixteen-story tower structure flanked by three-story wings are occupied by the Portland Gas & Coke Company, the Northwestern Electric Company and the Pacific Power & Light Company. The building is faced with white stone and has a colonnade course around the top floors. The Northwestern company and the Pacific Power & Light occupy the fourth, fifth and sixth floors respectively; the treasury departments of the three companies are on the seventh and eighth floors, and the presidents' offices and those of the legal department and the directors' room are on the fifteenth. Special attention was given to the lighting of the offices and salesrooms, both of which have a higher intensity than other commercial establishments of their kind in the city.

Decatur (Ill.) Service Improved. —The Illinois Power & Light Corporation last year expended $500,000 in improvement of its electric service in Decatur, Ill., the completion of two new transmission lines, making three interconnecting lines into the city, being the outstanding development. Seventy miles of lines were added to the distribution system, and a new substation, housing a 5,000-kw. synchronous condenser, was another improvement.

Riverside (Cal.) Municipal Plant Lowers Rates.—A reduction in lighting rates that is calculated to save city consumers $25,795 annually has been adopted by the City Council of Riverside, Cal. This saving is based on a reduction from 8 cents to 7 cents per kilowatt-hour. Accumulation of funds in the light and water department has been the cause for much dissatisfaction among consumers who believed rates should be reduced even if taxes were raised in consequence.

Samuel Ferguson on Floods and Interconnection. — Samuel Ferguson, president of the Hartford Electric Light Company, in speaking of the unprecedented November floods in New England, said recently: "The floods in New England have proved beyond question the value of interconnecting electric systems in maintaining service under conditions which must have incapacitated isolated generating plants. A few years ago the flooding of the great Vernon plant of the New England Power Company would have been a disaster to thousands. When it was flooded recently it made no difference at all to the company's customers owing to its interconnection with other plants in New England, New York and elsewhere, which enabled it to keep the service going."

## Coming Meetings

[A complete directory of electrical associations, with their secretaries, is published on page 80 of this issue.]

American Engineering Council—Washington, D. C., Jan. 9-11. L. W. Wallace, 26 Jackson Place, Washington.

Empire State Gas and Electric Association—Electric Section, Niagara Hotel, Niagara Falls, N. Y., Jan. 12 and 13. C. H. B. Chapin, Grand Central Terminal, New York.

Electrical League Conference — 30 North Dearborn Street, Chicago, Jan. 16 and 17. Society of Electrical Development, 420 Lexington Avenue, New Yprk.

New England Electrical Credit Association—Boston, Jan. 17. C. A. Kane, 176 Federal St., Boston.

N.E.L.A. Commercial Section—Edgewater Beach Hotel, Chicago, Jan. 18-20. A. J. Marshall, 420 Lexington Avenue, New York.

National Electrical Manufacturers' Association — Supply Division, Hotel Commodore, New York, Jan. 23-27. S. N. Clarkson, 420 Lexington Ave., New York.

Artistic Lighting Equipment Association—Winton Hotel, Cleveland, Jan. 25-28. G. P. Rogers, 711 Graybar Bldg., New York.

Northwest Association of Electrical Inspectors—Olympic Hotel, Seattle, Jan. 26-28. F. D. Weber, 414 Lumbermen's Building, Portland, Ore.

American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16. F. L. Hutchinson, 33 West 39th St., New York.

Rocky Mountain Division, N.E.L.A.—Albuquerque, N. M., Feb. 14-16. O. A. Weller, 900 15th St., Denver.

Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21. J. C. Plankington, Northwestern Electric Company, Portland, Ore.

Texarkana (Ark.) Plant to Be Doubled. — Material improvements in the power plant of the Southwestern Gas & Electric Company at Texarkana are under way. They include an addition to the boiler house and the installation of two boilers with a total rating of 1,520 hp.; a concrete stack 200 ft. high, an addition to the turbine room, where a 5,000-kw. turbo-generator will be installed, and various auxiliary equipment. The total capacity of the plant will be more than doubled.

Bureau of Mines Will Lend Electrical Films.—From the Pittsburgh experiment station or any distributing center the Bureau of Mines of the United States Department of Commerce will lend freely motion-picture films produced under the bureau's direction and showing mining and manufacturing processes. Several are of interest to electrical men, including three covering the "Story of Coal," three on the "Story of an Electric Meter," two on "Water Power," and two on the "Story of a Storage Battery."

St. Lawrence Rapids Development Is Broached.—Notice has been filed at Ottawa by the Montreal & Western Canada Company that the company will apply at the forthcoming session of the Canadian Parliament for authority to develop the rapids in the St. Lawrence River below Cornwall, Ontario. The proposed scheme is a very ambitious one. The company would build a 30-ft. waterway between Cornwall and Montreal and exploit the power incidental thereto. Those connected with the company are not mentioned in the notice.

New Braunfels (Tex.) Plant's Generating Capacity Will Be Doubled.—Plans already hinted at have been finally adopted for doubling the capacity of the electric power plant at New Braunfels, Tex., of the Comal Power Company, subsidiary of the San Antonio Public Service Company, at a cost of $1,500,000, according to E. H. Kifer, general manager. In addition to its own service, the Comal Power Company sells power to the Texas Power & Light Company and the Central Power & Light Company. The San Antonio company will also spend in its home city $750,000 for laying underground cables and construction of substations. The South Texas Public Service Company, another subsidiary, will spend $150,000 for constructing rural transmission lines and connections.

# News About Men of the Industry

L. P. Hite has been appointed manager of the Paducah district of the Kentucky Utilities Company to succeed R. A. Becker, who resigned because of ill health. Mr. Hite has been superintendent of production in charge of western Kentucky power plants, with headquarters at Earlington since last spring, and for a year previous to that connection he was manager of the Morganfield district. He affiliated himself with the company in March, 1926, after being in charge of the municipal electric plant at Henderson, Ky. W. C. Shields has been selected to succeed Mr. Hite as superintendent of production for Western Kentucky.

Andrew C. Erwin, president of the Athens Publishing Company, has been elected director of the Georgia Power Company to succeed the late J. Billups Phinizy. A native of Athens and a graduate of the University of Georgia, Mr. Erwin became prominent when he re-organized the Citizens Bank of Athens and later was made president of the Commercial National Bank. He has served the city of Athens as mayor and also as president of the Chamber of Commerce.

K. T. Kone has been appointed sales manager of the Panhandle Power & Light Company, Borger, Tex., which is controlled by the United Light & Power Company. Mr. Kone has engaged in sales work for the United companies since 1922.

George Barber has been named sales manager for the southern district of the Puget Sound Power & Light Company, with headquarters in Chehalis, Wash. He is succeeded as sales manager in the northern district by R. W. Lindley.

J. Paul Clayton, vice-president of the Central Illinois Public Service Company, Springfield, Ill., has been appointed chairman of the industrial development committee of the Illinois Chamber of Commerce. Mr. Clayton was formerly a director and vice-president of that same organization.

Horace B. Stout, counsel for the Railroad and Public Utilities Commission of the State of Tennessee for the past three years, has resigned. Mr. Stout has recently formed a law partnership and is leaving the commission to devote his time to private practice.

W. G. Gay, formerly industrial sales engineer of the Baton Rouge Electric Company, has been appointed sales manager to succeed H. P. Geisler, Jr. Mr. Gay started with the Stone & Webster organization in 1910 at the Boston office. He began power station work in Minneapolis and subsequently became chief engineer at New London, Conn., in 1916. Later he removed to Pawtucket, but he was transferred to Baton Rouge in 1919, where he served as chief engineer until he was made industrial sales engineer in 1926.

## *J. C. Guild Succeeds Edgar in Chattanooga*

J. C. Guild, Jr., has been appointed general manager of the Tennessee Electric Power Company to succeed the late B. C. Edgar, according to an announcement made by President B. C. Cobb. A native of Chattanooga and a graduate of Vanderbilt University, Mr. Guild has been serving as vice-president of the company for several years.

R. L. Kirk has been appointed assistant to the system development manager of the Duquesne Light Company, Pittsburgh. A graduate of the Carnegie Institute of Technology, Mr. Kirk was first employed by the Duquesne organization prior to the United States' participation in the World War. In 1922 he returned to the company, where he has occupied successively the positions of designer, section engineer, general engineer, assistant to the vice-president and work progress engineer.

James W. Reed, for three years manager for the Kentucky Utilities Company at Carlisle, has been transferred to Clinton in the capacity of manager. F. J. Hardesty of the Fulton staff of the company has removed to Carlisle as manager.

C. I. Isley, formerly local manager at Florence, S. C., for the Carolina Power & Light Company, has been transferred to the Asheville (N. C.) division of the company in the capacity of appliance sales manager.

L. H. Knapp, formerly connected with the industrial electric heating department of the General Electric Company, Schenectady, N. Y., has been appointed industrial electric heating engineer of the Hartford (Conn.) Electric Light Company.

H. S. Chandler, who has been connected with the Georgia Power Company at various times for the past 20 years, has been appointed sales manager for the Illinois Power Company at Decatur.

Bond P. Geddes of Washington, D. C., has been appointed executive vice-president of the Radio Manufacturers' Association to succeed L. S. Baker, resigned. Mr. Geddes brings to his new position a background of seventeen years of experience in press and public relations work in and outside of Washington. In addition to his newspaper, press association and public relations experience, Mr. Geddes has had legal training and is a member of the bar of the District of Columbia and a graduate of Columbia University. He assumed his new duties Nov. 1 at the Eastern headquarters of the Radio Manufacturers' Association in New York.

Herman Mezger has recently joined Stone & Webster, Inc., as an engineer in the electrical division. He was formerly with the Brazilian section of the Foreign Department of the Allgemeine Elektrizitäts Gesellschaft of Berlin. Since coming to this country he has been with the Westinghouse Electric & Manufacturing Company at East Pittsburgh.

Wallace S. Wick of Des Moines has been named as manager of the Oskaloosa properties of the Iowa Power & Light Company, succeeding J. H. Porter, resigned.

Earl Utley has been appointed local manager for the Kentucky Utilities Company at Clay, Ky., to succeed C. E. Utley, his father, who resigned Dec. 1 to enter other business.

W. R. Jessup is the new superintendent of the Lake Andes (S. D.) division of the Northwestern Public Service Company.

W. M. Flook, chairman of the board of the American Brown Boveri Electric Corporation, has been elected its president.

A. W. Atwater, for the past two years a partner in the engineering contracting firm of the Martin & Warlick Company, Chattanooga, Tenn., and formerly in the power-plant engineering field at Columbus, Ohio, has joined the mechanical engineering division of Stone & Webster, Inc., at Boston.

Edward Dickson has been appointed manager of the Trezevant plant of the Kentucky-Tennessee Light & Power Company.

## Obituary

Harry E. Hayes, for many years assistant engineer on the electrical staff of Charles H. Tenney & Company, Boston, Mass., died Dec. 30 at his home in Stoneham at the age of 62. He was a native of Madbury, N. H., was educated at Harvard College and the Massachusetts Institute of Technology, and in recent years had specialized in underground construction work for the North Boston Lighting Properties.

W. F. Harvey, president of the Porcelain Insulator Corporation, Lima, New York, died suddenly Jan. 4 at his home in Lima.

# Financial and Statistical News

## December Breaks All Financing Records with $303,332,500 Total

WITH A total of well over $300,000,000, December broke all previous records of monthly financing by power and light companies. In line with the relative proportions of refunding and new money existing during the previous eleven months, approximately half of this was for refunding purposes. December's figure constituted more than 14 per cent of the year's total.

The cost of money continued its downward trend during the year so that by December, financing could be carried out on a very favorable basis. Six of the sixteen bond (or note) issues sold were on a 4½ per cent basis, and on eight of these the yield was less than 5 per cent.

Among the largest issues of the month were two $40,000,000 issues, one sold by Alabama Power Company and the other by Duke Power Company, and a $60,000,000 issue sold by Philadelphia Company. Each of these three has a life of 40 years. Most of the month's financing was relatively long term.

An analysis of the year's financing will be found elsewhere in this issue.

AMERICAN WATER WORKS ISSUES DEBENTURES.—During the first week of January, 5 per cent gold debentures of the American Water Works & Electric Company were offered in the amount of $3,000,000, the price being 95 and interest. These debentures, dated Dec. 1, 1927, and maturing Dec. 1, 1975, will be direct obligations of the company. Proceeds will be used to reimburse the company in part for expenditures in connection with the acquisition of additional properties, for additional working capital and for corporate purposes.

## British Energy Consumption Up 57 per Cent in Five Years

The latest available figures for consumption of electricity in Great Britain are given in the annual report of the Electricity Commissioners for the period April 1, 1926, to March 31, 1927, which has just been issued. They show that the sales of energy by authorized undertakings to consumers amounted in 1926 to 5,723,000,000 kw.-hr. and represented an increase of about 57 per cent on the sales in 1922. This was an average consumption of about 130 kw.-hr. per head of the estimated population of the United Kingdom in 1926. The sales of electricity for power purposes increased during five years from 2,499,000,000 kw.-hr. to 3,760,000,000 kw.-hr., or by 50 per cent. Sales for lighting and other domestic purposes increased from 582,000,000 kw.-hr. to 1,244,000,000 kw.-hr., or by over 113 per cent. Those figures do not take into account the supply for traction purposes and the supply con-

SECURITY ISSUES OF ELECTRIC SERVICE COMPANIES IN DECEMBER

| Name of Company | Amount of Issue (Par Value) | Period Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |

Total amount actually realized ........ $293,415,102

Rights ........ $41,100,325
Total financing for December ........ $334,515,427

sumed in manufacturing and trading operations derived from privately owned generating plants. At the beginning of 1920 the number of bulk supplies which had been taken or arranged for was 120—namely, 70 by local authorities and 50 by companies. On March 31, 1927, the number of such supplies actually taken or arranged for had increased to 351—199 by local authorities and 152 by companies.

## Northern States Power Shareholders Offered Rights

ADDITIONAL capital is being secured by Northern States Power Company through the issue of rights to shareholders. Holders of class A and class B common stock have been offered the privilege of subscribing for the new stock to the extent of one-quarter of their present holdings.

To make provision for the new issue, the directors have authorized the sale of additional class A stock to the extent of one-quarter of the aggregate amount outstanding at the close of business Jan. 3. Additional B stock is being issued on a similar basis. The proceeds of the issue will be used for extensions and additions to the company's property. The offering, it is announced, has been underwritten without cost to the company.

Common stock class A now outstanding amounts to $17,967,600. The addition of one-quarter this amount would bring the total up to more than $22,000,000. Class B stock outstanding totals $5,000,000 and the addition of one-fourth this amount would bring the total to $6,250,000.

## Electricity Supply in Roumania

According to a recent official return, there are now 146 electric power stations in operation in Roumania. Of the total, 31 plants, or about 21 per cent, are hydro-electric; 44, or 28 per cent, are steam-operated, while 71, or approximately 50 per cent, utilize internal-combustion engines for the generation of power. The total installed capacity is about 174,300 kw. There are 86 plants with a combined capacity of 26,500 kw. producing continuous current, three single-phase alternating-current plants totaling 5,200 kw., two two-phase stations producing 10,000 kw. and 55 three-phase stations with an aggregate of 132,600 kw.

BIGGEST JAPANESE ELECTRIC COMPANIES UNITE.—The terms for consolidating the Tokio Electric Light and the Tokio Electric Power companies are now practically complete, according to the latest Japanese announcement. The companies constitute 15 per cent of the total capital of the electrical industry of Japan, and 19 per cent of the generating capacity.

Prolonged rate-cutting in the Tokio area prompted financial interests to exert their influence in effecting this amalgamation. Another important factor in negotiating the merger was the consideration that further foreign capital, which the industry requires, would be difficult unless competition was eliminated. The basis of the fusion is nine shares of the light company to ten of the power company.

IDAHO POWER SELLS PREFERRED.—The sale in thirty days of an entire new issue of 10,000 shares of preferred stock, mainly to customers, was an accomplishment of the Idaho Power Company, Boise, in the latter part of last year. The stock, which was a $6 cumulative no par stock, offered at $100, brought $1,000,000 into the company treasury for improvements and additions and other corporate purposes. It was absorbed locally, principally in small blocks sold by employees. The issue was authorized by the former stockholders and given the same position in the financial structure with respect to rights and privileges as is enjoyed by the older issue of 7 per cent preferred stock, all of which had been sold out long since. The new stock is callable at $110.

BUFFALO, NIAGARA & EASTERN INCREASES DIVIDEND RATE.—The board of directors of the Buffalo, Niagara & Eastern Power Corporation has authorized an increase in the dividend rate on common stock of that company. The increase is from 25 cents to 30 cents per share in the quarterly dividend. This increase will be received by common stockholders in the dividend checks which are sent out on Dec. 31.

## Immobility a Prime Factor in Plant Valuation

IN DISCUSSING "The Valuation of Public Utilities" before the American Economic Association, Arthur Twining Hadley, president emeritus of Yale University, among other things said:

"Valuation and assessment are quite distinct things. An assessment is a price fixed by a constituted authority for its own purposes. A valuation is an attempt to determine what a piece of property is worth. A value is created by public demand, not by political authority. It is calculated on the basis of 'fair market price.'

"Until recently the words value and valuation had their definite meaning in American law, as they still have it in American business usage. But about 30 years ago, Senator La Follette, in his attempt to find a basis for judging whether rates were reasonable, assessed the cost of duplication of the railroads concerned and called the result physical value.

"Was he justified in applying the old and well-understood name value to such an assessment? Those who say yes base their answer on three different grounds.

"The first group says that they have discovered another kind of value, a physical value as distinct from a commercial value. The obvious answer is that there was no such thing to discover. Physical value is a contradiction in terms. Value is a social phenomenon, not a physical one. Value is not a thing inherent in goods themselves. It is a result of their adaptation to the needs and wants of the people; in other words, of demand.

"The second group sees that physical value is a fiction, but holds that duplication cost furnishes a good measure of value. The answer is that it is a very bad measure. We can find many railroad lines whose cost of duplication would be more than ten times as great as their commercial value to their present owners or to any other owners. A yardstick that is liable to an error of over 1,000 per cent cannot be called a good measuring rod.

"A third group, more intelligent than the other two, sees that cost is not a kind of value, and is not a good measure of value as it is, but says that it is a good measure of value as it ought to be. If an ordinary merchant, investing prudently, finds it hard to make over 6 per cent, 6 per cent on prudently invested capital ought to be enough to allow the investors in large corporations.

"The difficulty with this answer is that large investments in progressive industries are subject to risks from which merchandise is free. You cannot limit the profits of the successful concerns to the ordinary rate of commercial discounts without preventing developments and improvements. We have had a signal example of the failure of the attempt in the history of railroad development in recent years.

"If there is not enough demand for a given sort of merchandise in one place, it can be sent to another. If there has been an over-production of that merchandise which makes prices too low everywhere, the surplus supply can soon be used up. The consequence is that the price of merchandise seldom falls very far below cost. But in the case of fixed investment, the matter is different.

"The capital, once invested in a power plant or railroad, must stay where it is and cannot go somewhere else. If the local demand falls short of the expectation, the risk involved in locating a plant in a new territory is very great. The risk in developing new processes with it is greater still."

NEW YORK UTILITY REDUCES NUMBER OF SHARES.—The New York State Gas & Electric Corporation, Ithaca, has filed a certificate in the office of the Secretary of State reducing the number of shares of its no-par-value stock from 125,000 to 100,000.

# Business News and Market Conditions

## Electrical Exports Show Normal Growth

### Increase for 1927 is nearly 4½ per cent. European markets expand, while Western Hemisphere shows a decrease of $4,000,000

By Marshall T. Jones
Chief Electrical Equipment Division,
Bureau of Foreign and Domestic Commerce, Washington, D. C.

EXPORTS of electrical equipment for 1927 show an ever-increasing trend over former years. The total value of materials shipped abroad in 1926 was $98,495,245, as compared with $94,243,813 exported during the first eleven months of 1927. Details for the first 10 months of 1927 are shown in the accompanying table and compared with 1926. If the average for the first eleven months is taken to cover December shipments, the total for 1927 will run to $102,811,432, or an increase of 4.4 per cent over 1926.

As regards commodities, exports of direct-current and alternating-current generators and parts, including steam turbine sets, show a slight loss for 1927, amounting to about 7½ per cent, predicating this percentage on the basis of twelve months. The largest percentage loss was shown in the transformer classes, amounting to 25 per cent, in value nearly $900,000. Watt-hour, volt, and other meters also showed a slight loss of about 5 per cent. Domestic heating and cooking devices registered about an 11 per cent loss. Telephone equipment was another item that fell off to the amount of about 25 per cent. Gains, however, are shown for such items as motors, electric fans, lamp bulbs, motor-driven household devices, and electric light fixtures. The most startling gain was shown in the exports of domestic washing machines, amounting to 45 per cent, in value a gain of $424,000. Next come motor-driven household devices, such as vacuum cleaners, etc., showing a gain of 35 per cent, or $608,000 in value.

Radio receiving sets and equipment show a gain of only 2 per cent, amounting roughly, to $138,000, but this class of material amounts to approximately 8 per cent of the total exports, constituting the largest single class item. Flashlights and flashlight batteries have shown a decided increase as regards their exportation, gaining nearly $1,000,000 in value over 1926 figures.

Canada is our outstanding export market, consuming roughly 20 per cent of our total exports. Shipments to Canada during 1927 show a 10 per cent increase over those of 1926. The Western Hemisphere, owing to the fact that Canada is included therein, takes half of the total shipments, with Europe consuming about 14 per cent, the balance going to the remainder of the countries of the world. For the first eleven months of 1927 an increase of shipments to Europe over the total for 1926 is already shown, amounting to more than $1,000,000, whereas shipments to the Western Hemisphere have decreased by about $4,000,000. Our largest loss is shown in our trade with Japan, which is only a little more than half the figure shown for 1926. Australian trade has

| United Kingdom | 14,336 | 133,354 | 34,978 | 52,125 |
| Total | $696,463 | $860,237 | $694,267 | $598,474 |

also slightly decreased, as well as that with New Zealand and India. The Philippine Islands, however, have made up for some of this loss in the Far East. South and Central America, with the exception of Argentina, Brazil, and Colombia, show slight increases, whereas our Chilean trade has dropped off $3,000,000.

Virtually every European country has taken more electrical goods from us than they did in 1926, showing that our market there is slowly developing and furthermore that such growth is about equally distributed among all the countries. In general, the year's trade shows a normal growth along a great many lines, indicating that American manufacturers are slowly but surely pushing ahead to develop their foreign markets.

## Energy Consumption Per Domestic Customer

The accompanying table giving the energy consumption per domestic customer is based on kilowatt-hours sold to domestic customers and number of customers reported by 72 companies for the year 1926.

| Section | No. Companies Reporting | Minimum | Average | Maximum |
|---|---|---|---|---|
| New England | 6 | 259 | 339 | 440 |
| Middle Atlantic | 10 | 161 | 399 | 680 |
| South Atlantic | 4 | 256 | 404 | 550 |
| East North Central | 20 | 231 | 380 | 569 |
| West North Central | 7 | 275 | 383 | 468 |
| East-South Central | 5 | 298 | 337 | 371 |
| West-South Central | 6 | 268 | 334 | 384 |
| Mountain | 5 | 129 | 338 | 518 |
| Pacific | 9 | 122 | 463 | 815 |

## Imports of Electrical Apparatus Into United States

With this issue of the Electrical World a compilation giving the imports of electrical apparatus into the United States by commodity and by country of origin for the first, second and third quarters and the last two months of this year is presented. The figures for the first and second quarters have appeared previously, and figures for every succeeding quarter will be printed as soon as available. No particular articles stand out prominently in the table, nor is there an abnormal amount of any particular commodity imported. For the first half of the year Switzerland heads the list with $459,845, Germany comes second with $382,840 and Japan is third with shipments of $259,743.

## *Appliance and Merchandise Sales for 1926 and 1927*

(Compiled by *Electrical Merchandising*)

Note: These figures were compiled by *Electrical Merchandising* from sales records of associations and manufacturers and from estimates made by association executives and leading manufacturers.

| Appliance and Merchandise | 1926 Number Sold | 1926 Retail Value | 1927 Number Sold | 1927 Retail Value |
|---|---|---|---|---|
| Cleaners | 1,065,000 | 65,000,000 | 1,028,000 | 49,344,000 |
| Clocks | 90,000 | 2,250,000 | 95,000 | 2,500,000 |
| Cookers (660 watts and under) | 175,000 | 1,750,000 | 200,000 | 1,800,000 |
| Dishwashers | 6,500 | 1,040,000 | 9,000 | 1,440,000 |
| Fans | 1,000,000 | 15,250,000 | 750,000 | 11,250,000 |
| Fixtures, residential | 13,000,000 | 78,000,000 | 13,000,000 | 75,000,000 |
| Flashlights and renewal batt's | ....... | 40,000,000 | ....... | 44,000,000 |
| Floor polishers | 90,000 | 5,400,000 | 100,000 | 6,000,000 |
| Heating pads, etc | 230,000 | 1,840,000 | 255,000 | 1,657,500 |
| Hot plates, grills and table stoves | 300,000 | 1,800,000 | 315,000 | 1,890,000 |
| Ironing machines | 57,000 | 8,835,000 | 68,000 | 10,880,000 |
| Irons | 3,000,000 | 16,000,000 | 3,000,000 | 14,250,000 |
| Lamps, incandescent | 500,000,000 | 170,000,000 | 538,000,000 | 160,000,000 |
| Lighting units, commercial | 2,000,000 | 24,000,000 | 1,800,000 | 22,000,000 |
| Percolators | 400,000 | 6,000,000 | 450,000 | 5,400,000 |
| Portable lamps and shades | 6,000,000 | 80,000,000 | 6,000,000 | 72,000,000 |
| Plugs, pural | 3,000,000 | 1,200,000 | 3,000,000 | 1,200,000 |
| Radiators and heaters | 448,000 | 2,688,000 | 450,000 | 2,475,000 |
| Ranges (except wall outlet) | 110,000 | 16,500,000 | 110,000 | 17,600,000 |
| Ranges, wall outlet | ....... | ....... | 10,000 | 500,000 |
| Refrigerators, domestic | 248,000 | 65,200,000 | 365,000 | 82,125,000 |
| Sewing machines | 315,000 | 29,925,000 | 350,000 | 33,250,000 |
| Toasters | 600,000 | 2,250,000 | 625,000 | 2,343,000 |
| Vibrators | ....... | ....... | 150,000 | 1,150,000 |
| Violet ray outfits | 125,000 | 2,000,000 | 145,000 | 2,250,000 |
| Waffle irons | 180,000 | 2,160,000 | 300,000 | 3,300,000 |
| Washing Machines | 843,000 | 124,000,000 | 790,000 | 118,500,000 |
| Total | | 763,088,000 | | 744,104,500 |

# Market Conditions

OPTIMISTIC reports regarding sales this year are borne out by the encouraging trends directly reported by manufacturers as to the current business. Inquiries in New England presage good future sales, and electric illumination is attracting much attention. Central-station business closed in the Eastern district includes the purchase of $500,000 worth of substation equipment by the Brooklyn Edison Company and inquiries for more of such material from other companies. The United States Shipping Board also has contracted for electric drive marine equipment totaling close to $550,000. Wire and cable business gives an indication of being a feature of the demand during the next few weeks. Industrial plant sales have been exceptional and there are indications that they will continue.

An industrial company in Tennessee has ordered part of the equipment for a million-dollar hydro-electric plant. Central-station buying in the Southeast is only for immediate requirements. The Georgia Power Company has announced a budget of $12,755,000 for 1928. In St. Louis activity is mainly in the southwestern part of the territory. Two pole contracts for $60,000 each were placed on the Pacific Coast. Extensive campaigns are planned by the power companies to cover home lighting, heating and cooking.

## *Copper Prices Stiffen Despite Inactive Market*

Markets for the non-ferrous metals have been very quiet. Copper, however, has shown strength and is virtually established at 14⅛ cents delivered. Lead is unchanged in New York and slightly firmer in St. Louis, whereas zinc is a shade weaker. Tin prices are off a fraction of a cent in the domestic market.

NEW YORK METAL MARKET PRICES

| | Dec. 28, 1927 Cents per Pound | Jan. 4, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14 | 14⅛ |
| Lead, Am. S. & R. price | 6½ | 6½ |
| Antimony............ | 10⅞ | 10⅞ |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots............ | 6 | 5.95 |
| Tin, Straits........... | 57⅛ | 10¾ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper price Jan. 4, 1928, 15¾ cents.

## *Business Shows Revival in Eastern District*

The turn of the year has brought an encouraging tone in the New York market and other Eastern centers. Central-station business shows definite signs of revival, with actual commitments on the part of one leading utility company and projects for early maturity among other power interests in this territory. The Brooklyn Edison Company has divided an order for about $500,000 worth of substation equipment between two large manufacturers. The New York Edison Company has work under way on three new substations, and others are projected. The Public Service Electric & Gas Company, Newark, plans the erection of a substation at West Orange, N. J., and is expected to place orders for equipment within 60 days. The United States Shipping Board has contracted with a large manufacturer for electric drive marine equipment totaling close to $550,000, being a part of an appropriation of $15,000,000 available for machinery of this kind and the first order to be placed. Business in wire and cable gives indication of being a feature of demand during the next few weeks.

A leading manufacturer of industrial equipment reports very satisfactory business and says that sales in this line for more than a month past have been exceptional with indications of continuance on this basis for several weeks to come.

Forthcoming construction projects in the Eastern district include the following: Dwight P. Robinson & Company, New York, will handle an expansion program at the plant of the Gulf States Steel Company at Alabama City, Ala., including installation of power plant with capacity of 10,000 kw., complete electrification of drives on present rod mill, and other equipment electrification at an estimated cost of nearly $2,000,000. The Quartermaster, Second Corps Area, Governor's Island, New York, is asking bids until Jan. 16 for one air-injection or solid-injection full Diesel marine-type engine, two-cycle or four-cycle. The Huntoon Ice Company, 91 Seventh Avenue, New York, has filed plans for a three-story addition to its plant. C. Hoffberger & Company, Baltimore, Md., plans an eleven-story ice and cold-storage plant to cost about $850,000. The West Penn Power Company, Pittsburgh, plans the erection of a one-story equipment storage and distributing building at Charleroi, Pa.

## *Tennessee Industrial Plant Places Large Order*

Orders placed by an industrial company in Tennessee for waterwheels, turbines, generators and transformers for a 90,000-kw. hydro-electric generating plant which when complete will cost in the neighborhood of $1,000,000 were the most important business transacted in the Southeast. Central-station companies are purchasing for only immediate requirements, but, considering the season of the year, the volume of business is reasonably satisfactory. One company placed orders for 45,000 lb. of weatherproof solid-copper wire and $6,800 worth of creosoted pine poles.

Construction plans are as follows: The Central Florida Light & Power Company, Dunnellon, Fla., plans the construction of an ice plant at Iverness, Fla. Miami Beach, Fla., plans an ornamental lighting system on portion of Collins Avenue. The Georgia Power Company, Atlanta, has purchased the municipal power station and ice plant at McRae, Ga., and will build a transmission line and local substation. The Stimpson Computing Scales Company, Louisville, Ky., plans a new plant to cost about $100,000. The Carolina Power & Light Company, Raleigh, N. C., plans extensions in the Asheville district, to cost about $200,000. The Electric City Ice Company, Anderson, S. C., plans a 30-ton ice plant. The Railway Ice Company, 309 South La Salle Street, Chicago, plans an ice plant at Memphis, Tenn. The Carolina Cement Company, Port Huron, Mich., recently organized, plans a mill on the Trent River, near New Bern, N. C., to cost more than $2,000,000.

## *Business Accelerates in the Middle West*

The Middle West is entering the 1928 period with confidence founded on a prosperous year. The acceleration of business noticeable during the last quarter of 1927 is expected to continue throughout most of the coming year, at least through the first quarter of 1928. Jobbers' sales were generally satisfactory. Appliances are moving readily, particularly vacuum cleaners, one order being placed for 1,000 machines.

The Continental Ice Company, Savanna, Ill., will build an ice plant, estimated to cost $300,000. Kendallville, Ind., will take bids in January for a municipal power plant to cost about $85,000. Cedar Rapids, Iowa, plans an ornamental lighting system on 20 blocks in the business section. The Central States Electric Company, Cedar Rapids, plans a hydro-electric power plant on the Des Moines River, near Fort Dodge, to cost about $1,000,000, with transmission lines. Lansing, Mich., will erect a municipal power and water station to house present equipment and proposed additional machinery. The Swedish Hospital, Minneapolis, will build a power plant in connection with its proposed hospital unit, to cost $500,000. The Waldorf Paper Products Company, St. Paul, is asking bids until Jan. 10 for a power-plant and paper-mill addition, to cost about $200,000. St. Paul, will install an ornamental lighting system on portions of Hatch, Thomas and Albert Streets. The Universal Portland Cement Company, Chicago, plans a cement mill in the Cuyahoga River Valley near Cleveland, Ohio, to cost $2,000,000. The Department of Public Welfare, Cleveland, plans a power plant at the boys' farm at Hudson, estimated to cost $75,000. The Ohio Public Service Company, Elyria, Ohio, plans a one-story equipment storage and distributing plant to cost about

$75,000. New Philadelphia, Ohio, plans an ornamental lighting system on Ackley, Park and other streets. The Northwestern Public Service Company has been granted a franchise at Columbia, S. D., and will build a transmission line to that district. Madison, Wis., will install an ornamental lighting system on University Avenue and adjacent streets to cost about $24,000.

### *Sales Mainly in Southwestern Part of St. Louis District*

All of the activity in the St. Louis district seems to be centered in the southwestern part of the territory. Contracts noted are for six high-tension transformers amounting to $59,000; 65 motors of 35 hp., 50 hp. and 65 hp. for oil-well pumping at a cost of $67,000 and a switchboard for $5,300. An order for a small lot of motors, 25-hp. and 35-hp. units is reported as placed by a St. Louis company at a total cost of $5,750.

Construction projects in the district are as follows: The Arkansas Cold Storage Company, Little Rock, Ark., plans a three-story addition to cost $100,000. W. S. Merkle, St. Louis, has plans under way for a hydro-electric power project in the south-central portion of the state, to cost in excess of $1,000,000. Muskogee, Okla., plans an ornamental lighting system in the business district to cost $50,000. The Texas Central Power Company will build a power plant at Brownsville, Tex., to cost about $50,000. The Gulf States Utilities Company, Beaumont, Tex., is arranging an expansion program in 1928, to cost $1,200,000, including additions in the power plant at Orange. The Houston (Tex.) Lighting & Power Company will build a two-story substation on Peden Avenue, to cost approximately $35,000. The Central Power & Light Company, San Antonio, plans a lighting system at Bandera, Tex.

### *Two Large Pole Contracts Closed on Pacific Coast*

Yearly pole contracts were placed on the Pacific Coast by the Pacific Gas & Electric Company and the San Joaquin Light & Power Corporation. Each approximating $60,000, for delivery early in 1928. Power-company orders were mainly composed of emergency or small stock orders. Private pole-line jobs were reported from Morgan Hill, Jasper, Watsonville and Turlock, each on the basis of about 50 to 100 poles. Street-lighting business is excellent, orders are being placed for units in Sacramento, a Stockton order for about 80 is under consideration, and specifications are being written for 87 standards for Los Banos.

Business in the Seattle and Puget Sound centers was quiet, while inventory was taken. Few motor sales are reported, these being small and distributed about equally between lumber mills, allied industrials and dealers. The following projects will come up after the first of the year: Traffic-signal system for Yakima, boulevard lighting system in Olympia, underground wiring for police and fire-alarm system for Bellingham, and a second transmission line from the Puget Sound Power & Light Company plant at Concrete to Everett, a distance of more than 100 miles. A 120-ton pulp and paper mill costing $3,000,000 is proposed for Seattle, and Kelso and South Bend also announce proposed pulp mills.

Construction plans are as follows: Alhambra, Cal., plans an ornamental lighting system on Fremont, Hellman and other streets. Garden Grove, Cal., plans an ornamental lighting system in the downtown district. Karpen & Brothers, Inc., Chicago, plan a four-story furniture plant at Los Angeles, Cal., to cost $350,000. The Southern California Edison Company, Los Angeles, will build a power substation near Irvine, estimated to cost $110,000. The Pacific Gas & Electric Company, San Francisco, plans a substation at Yuba City, Cal., with initial capacity of 3,000 kw. Santa Barbara, Cal., plans an ornamental lighting system on State Street. South Pasadena, Cal., plans an ornamental lighting system on Milan Avenue and other streets. Grand Junction, Colo., plans an ornamental lighting system on Seventh Street.

### *Inquiries Increasing in New England District*

Inquiries received in the New England district forecast an encouraging trend. Central-station material orders have fallen off to some extent, though the amount of regular scheduled material sold compares favorably with the business of last year. Transformer inquiries are increasing, meter sales are fair, and control equipment is selling well.

The New England Telephone & Telegraph Company will expend $2,500,000 in expanding service in its territory. Plans for improvement of the Boston Elevated service will be presented to next legislature and include proposed expenditures amounting to $40,000,000. Factory expansion is announced by the Boston Gear Works. Building construction in view shows a trend comparable to that of last year. The Worcester Electric Light Company, Worcester, Mass., has filed plans for improvements and alterations in its station on Foster Street, estimated to cost $75,000.

# Activities of the Trade

## Servel Company Reorganizes as Servel, Inc.

All of the related Servel companies, which have been under receivership since August, 1927, have been reorganized and will go forward with the manufacture and sale of its compression and absorption refrigerating units. Colonel F. E. Smith, who was receiver for the original company and has been active in its reorganization, is president of the new concern, which is known as Servel, Inc. The other officers are: W. F. Thatcher, vice-president; D. L. Adkins, secretary; F. O. Cummings, controller, and H. W. Foulds, general sales manager. Colonel Smith in discussing the reorganization with a representative of the ELECTRICAL WORLD said that it was the aim of the new company to develop the refrigeration business and to co-operate with both the ice and the mechanical refrigeration industry.

Two new subsidiaries have been formed, one, Servel Sales, Inc., which will handle the marketing of the refrigerating units, and the other, Hercules Products, Inc., which will take care of gas-engine and commercial body sales. The reorganization committee, comprising G. W. Davison, N. F. Brady, C. M. Kittle, A. H. Wiggin and Murray Coggeshall, announced that Jan. 16 has been set as the last day when deposits of the five-year 6 per cent convertible notes of the Servel Corporation and claims against it and its subsidiaries will be received without penalty. Undeposited common shares of the corporation will be received up to that date on payment of two installments of $1 a share each, now past due, plus interest on the installments at 6 per cent annually.

## Williams Oil-O-Matic Holds Oil-Burner Training Schools

For the purpose of instructing dealers in proper installation and servicing of its oil-burner house-heating equipment the Williams Oil-O-Matic Heating Corporation, Bloomington, Ill., is conducting a series of regional training schools during January and February. Two-day sessions are being held in sixteen cities, and the schools will be open to central-station men, even though they do not sell oil burner equipment.

The schools are being held under the supervision of Earl Nesmith and R. D. Marshall, factory representatives of the corporation, and the schedule is as follows: Minneapolis, Minn., Jan. 3-4; Omaha, Jan. 6-7; Indianapolis, Jan. 9-10; Lansing, Mich., Jan. 12-13; Toronto, Jan. 16-17; Montreal, Jan. 19-20; Boston, Jan. 23-24; Rochester, Jan. 26-27; New York City, Jan. 30-31; Philadelphia, Feb. 2-3. Training schools will also be held in the following cities on dates to be announced later: Richmond, Va.; Charlotte, N. C.; Atlanta, New Orleans, Memphis and St. Louis.

# Directory of Electrical Associations

Printed in the First Issue of Each Volume

American Association of Engineers. Secretary, M. E. McIver, 63 East Adams St., Chicago, Ill.

American Electric Railway Association. Managing director, Lucius S. Storrs. General secretary, J. W. Welsh, 292 Madison Ave., New York City.

American Electrochemical Society. Secretary, Colin G. Fink, Columbia University, New York City.

American Engineering Council. Executive secretary, L. W. Wallace, 26 Jackson Place, Washington, D. C.

American Engineering Standards Committee. Secretary, P. G. Agnew, 29 West 39th St., New York City.

American Institute of Consulting Engineers, Inc. Secretary, P. W. Henry, 111 Broadway, New York City.

American Institute of Electrical Engineers. National secretary, F. L. Hutchinson, 33 West 39th St., New York City. Board of directors meets bi-monthly. Sections and branches meet monthly in the principal electrical centers throughout the country. Three national and several regional conventions held each year.

American Institute of Mining and Metallurgical Engineers. Secretary, H. Foster Bain, 29 West 39th St,, New York.

American Society for Testing Materials. Secretary-treasurer, C. L. Warwick, 1315 Spruce St., Philadelphia, Pa.

American Welding Society. Secretary, M. M. Kelly, 29 West 39th St., New York.

Arkansas Utilities Association. Secretary-treasurer, R. I. Brown, Arkansas Power & Light Co., Little Rock, Ark.

Artistic Lighting Equipment Association. Managing director, G. P. Rogers, 711 Graybar Bldg., 420 Lexington Ave., New York City.

Association of Edison Illuminating Companies. Secretary, Preston S. Millar, 80th St. and East End Ave., New York.

Association of Electragists International (formerly National Association of Electrical Contractors and Dealers). Secretary, Laurence W. Davis, 15 West 37th St., New York City, N. Y. Direct membership throughout the United States and Canada.

Association of Iron and Steel Electrical Engineers. Managing director, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

Association of Railway Electrical Engineers. Secretary-treasurer, Joseph A. Andreucetti, Room 413, C. & N. W. Terminal Station, Chicago, Ill.

Canadian Electrical Association (affiliated with N.E.L.A.). Secretary, H. W. Lyster, 712 Power Bldg., Montreal.

Colorado Utilities Association. Secretary-treasurer, O. A. Weller, Public Service Co. of Colorado, Denver, Col.

East Central Geographic Division, N.E.L.A. Secretary, D. L. Gaskill, Greenville, Ohio.

Eastern Association of Electrical Inspectors. Secretary, E. P. Slack, fifth floor, 85 John St., New York City.

Eastern Geographic Division, N.E.L.A. Secretary, Harold A. Buch, Telegraph Building, Harrisburg, Pa.

Electric Association (Chicago). Manager, R. Bourke Corcoran, 30 North Dearborn St., Chicago, Ill.

Electrical League of Colorado. Executive manager, George Bakewell, Jr., Gas & Electric Bldg., Denver, Col.

Electrical League of Utah. Field secretary, R. E. Folland, Newhouse Hotel, Salt Lake City, Utah.

Electrical Manufacturers' Club. Secretary, Walter F. Field, Safety Cable Co., New York City.

Electrical Supply Jobbers' Association. Executive secretary, E. Donald Tolles, 165 Broadway, New York City.

Electrical Supply Jobbers' Association, Pacific Coast Division. Secretary, Albert H. Elliot, 502 Flatiron Building, San Francisco, Cal.

Empire State Gas and Electric Association. Secretary, Charles H. B. Chapin, Grand Central Terminal, New York City.

Florida Engineering Society. Secretary, J. R. Benton, Gainesville, Fla.

Georgia Electrical Association. Secretary-treasurer, J. J. McDonough, Georgia Power Co., Dublin, Ga.

Great Lakes Geographic Division, N.E.L.A. Secretary-treasurer, R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

Illinois State Electric Association. Secretary-treasurer, R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

Illuminating Engineering Society. General secretary, L. H. Graves, 29 West 39th St., New York City.

Illuminating Glassware Guild. Assistant business manager, C. H. Ferris, Stevenson Corp., 19 West 44th St., New York City.

Indiana Electric Light Association. William Stokes, acting secretary, 1547 Consolidated Building, Indianapolis, Ind.

Institute of Radio Engineers. Secretary, Alfred N. Goldsmith, 37 West 39th St., New York City.

International Association of Municipal Electricians. Secretary, H. N. Lang, Box 1864, Orlando, Fla.

International Electrotechnical Commission (international body representing various national electrical engineering societies contributing to its support). General secretary, C. le Maistre, 28 Victoria St., Westminster, London, S. W., England.

Iowa Section, N.E.L.A. Secretary and treasurer, H. E. Weeks, Davenport, Iowa.

Kansas Section, N.E.L.A. Secretary, H. Lee Jones, 401 National Reserve Building, Topeka, Kan.

Kentucky Association of Public Utilities. Secretary, E. F. Kelley, Louisville Railway Company, Louisville, Ky.

Maryland Utilities Association. Secretary, G. S. Williams, United Railways & Electric Co. of Baltimore, 1005 Continental Bldg., Baltimore, Md.

Michigan Electric Light Association. Secretary, Herbert Silvester, Edison Bldg., Ann Arbor, Mich.

Middle West Geographic Division, N.E.L.A. Secretary-treasurer, T. A. Browne, 1519 O St., Lincoln, Neb.

Missouri Association of Public Utilities. Secretary-treasurer, F. D. Beardslee, 315 North 12th St., St. Louis, Mo.

National Association of Electrical Inspectors. Executive secretary, T. H. Day, 59 Deerfield Ave., Hartford, Conn.

National Association of Railroad and Utilities Commissioners. Secretary, James B. Walker, 270 Madison Ave., New York.

National Committee on the Relation of Electricity to Agriculture. Director, E. A. White, 1120 Garland Bldg., Chicago.

National Electric Light Association. Managing director, Paul S. Clapp, 420 Lexington Avenue, New York City.

National Electrical Credit Association. Secretary, Frederic P. Vose, 1008 Marquette Building, Chicago, Ill. Central, New England, New York, Middle and Southern Atlantic States and Pacific Coast Divisions.

National Electrical Manufacturers Association. (Consolidation of Associated Manufacturers of Electrical Supplies, Electric Power Club and Electrical Manufacturers' Council.) Managing director, Alfred E. Waller, 420 Lexington Ave., New York City.

National Fire Protection Association. Chairman of electrical committee, A. R. Small, 109 Leonard St., New York City.

National Safety Council. Managing director and secretary, W. H. Cameron, 108 East Ohio St., Chicago, Ill.

Nebraska Section, N.E.L.A. Secretary-treasurer. T. A. Browne, 1527 Sharp Building, Lincoln, Neb.

New England Geographic Division, N.E.L.A. Secretary, Miss O. A. Bursiel, Statler Building, 20 Providence St., Boston, Mass.

New Jersey Electric Association. Secretary-treasurer, J. Hall Truman, Eastern New Jersey Power Co., Asbury Park, N. J.

New Mexico Utilities Association. Secretary-treasurer, Bernard L. Wiles, Albuquerque, N. M.

New York Electrical League. Secretary, David T. Brown, 270 Canal St., New York City.

New York Electrical Society. Secretary, H. E. Farrer, 29 West 39th St., New York City.

North Central Electric Association (Geographic Division N.E.L.A.). Executive secretary, J. W. Lapham, 803 Plymouth Bldg., Minneapolis, Minn.

Northwest Electric Light and Power Association (Geographic Division N.E.L.A.) Secretary, Berkeley Snow, 1208 Spalding Building, Portland, Ore.

Oklahoma Utilities Association. Manager, E. F. McKay, 1020 Petroleum Building, Oklahoma City, Okla.

Pacific Coast Electrical Association (Pacific Division N.E.L.A.). Secretary, Samuel H. Taylor, Suite 729-730, 447 Sutter St., San Francisco, Cal.

Pennsylvania Electric Association (State Section N.E.L.A.). Managing director, A. B. Millar; secretary-treasurer, Harold A. Buch, Telegraph Bldg., Harrisburg, Pa.

Public Utilities Association of Virginia. Secretary, A. H. Herrmann, Virginia Electric & Power Company, Richmond, Va.

Public Utilities Association of West Virginia. Secretary, A. B. Tunis, 306 Securities Building, Charleston, W. Va.

Radio Club of America. Secretary, Thomas J. Styles, 55 West 42d St., New York City.

Rocky Mountain Geographic Division, N.E.L.A. Secretary, O. A. Weller, Public Service Co. of Colorado, Denver, Col.

Society for Electrical Development, Inc. President, W. W. Freeman; chairman executive committee, C. L. Edgar; secretary-treasurer, J. Smieton, Jr., 420 Lexington Ave., New York. Annual meeting second Friday in September; directors' meetings second Friday in March, June, September and December; executive committee meetings every thirty days.

Society for the Promotion of Engineering Education. Secretary, Prof. F. L. Bishop, University of Pittsburgh, Pittsburgh, Pa.

Society of Industrial Engineers. Secretary, Geo. C. Dent, 608 South Dearborn St., Chicago, Ill.

Southeastern Geographic Division, N.E.L.A. Secretary, C. M. Kilian, 402 Wynn-Claughton Bldg., Atlanta, Ga.

Southeastern Water and Light Association. Secretary-treasurer, W. F. Steiglitz, Columbia, S. C.

Southwestern Geographic Division, N.E.L.A. Secretary, S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Southwestern Public Service Association. Secretary, E. N. Willis, 403-4 Slaughter Bldg., Dallas, Tex.

Vermont Electrical Association. Secretary-treasurer, F. J. Sisco, St. Albans, Vt.

Western Section, International Association of Electrical Inspectors (successor to Western Association of Electrical Inspectors). Secretary, W. S. Boyd, 175 West Jackson Blvd., Chicago, Ill.

Western Society of Engineers. Secretary, E. S. Nethercut, 1735 Monadnock Block, 53 W. Jackson Blvd., Chicago, Ill.

Wisconsin State Association of Electrical Contractors and Dealers. Chairman and secretary, L. W. Burch, 202 East Washington Ave., Madison, Wis.

Wisconsin Utilities Association. Executive secretary, John N. Cadby, 432 Broadway, Milwaukee, Wis.

Wyoming Utilities Association. Secretary, L. J. Meyer, Mountain States Telephone & Telegraph Co., Cheyenne, Wyo.

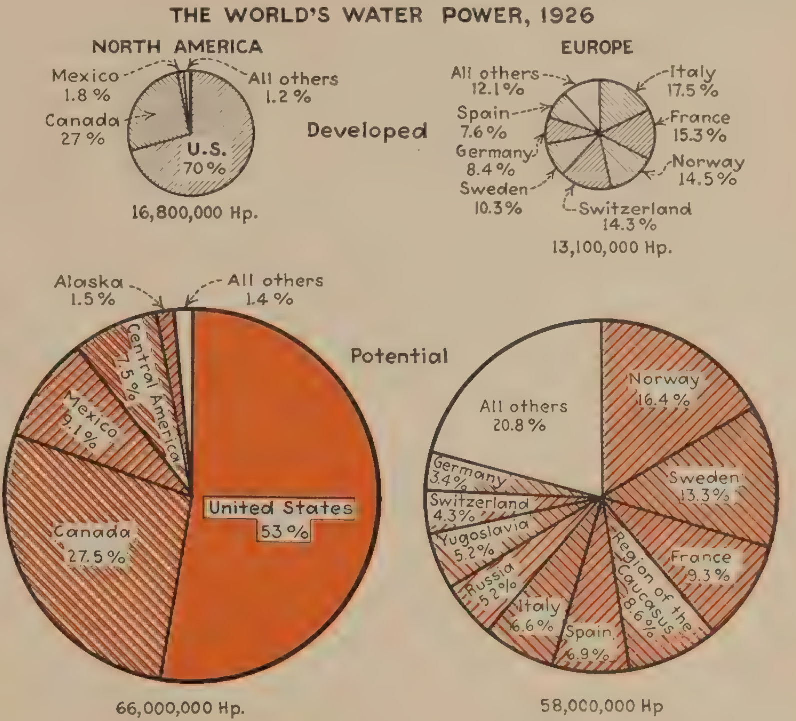
## A Hundred Niagaras

NEARLY half a billion hydraulic horsepower still awaits development before the world's known sites shall have all been put to use. The total potential horsepower has recently been estimated at 454,000,000; installed plants aggregate only 33,000,000 hp. Since the installed capacity may well amount to two or three times the power available at minimum flow, it is evident that a billion horsepower is not too high an estimate of the ultimate possibilities.

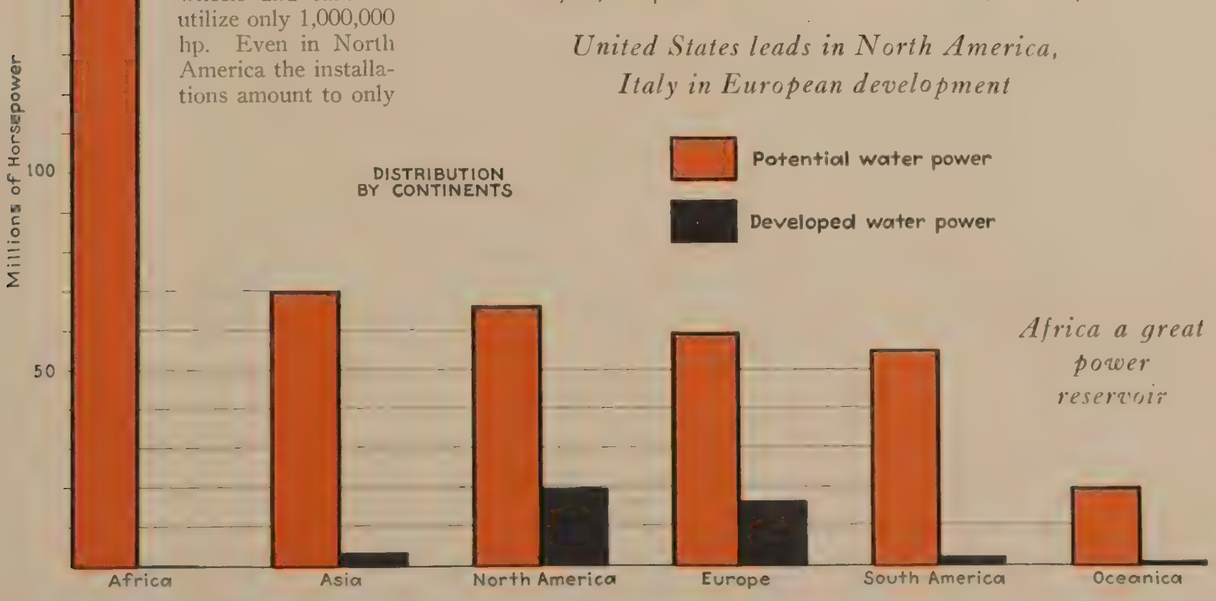
Toward the utilization of this great and continuously replenished storehouse of power dwellers in the North Temperate Zone have made a beginning, but compared with what may eventually be done the world's water-power resources have barely been tapped. Their greatest exploitation still awaits man's conquest of the tropics.

Of the available total, fully 40 per cent, or 190,000,000 hp., is in Africa. Asia has 69,000,000. South America 54,000,000. On those three great continents hydraulic wheels and turbines utilize only 1,000,000 hp. Even in North America the installations amount to only one-fourth of the low-water flow, and perhaps a tenth of what may ultimately be installed. The same may be said of Europe.

So long as the present economic balance continues between fixed charges on hydro-electric developments and the cost of energy from fuel, so long will mountain fastness and forest continue to resound to the roar of great waters not yet shackled.



*United States leads in North America, Italy in European development*



*Africa a great power reservoir*

# Southern States Continue High Production

IN ACCORDANCE with trends established in past years the manufacturing plants of the Southern States have been operating during the fall months at a rate materially exceeding that reported during the first half of the year. Productive activity in November was about on the same level as in September and October, but was 2 per cent over November, 1926.

During November three of the primary industrial groups of the Southern States—textiles, lumber and its products, and stone, clay and glass—witnessed productive activities over those reported for November, 1926. On the other hand, three other important industrial groups—fertilizers, rolling mills and steel plants, and paper and pulp—reported operations at a rate under those of 1926. The textile plants of the section, which have been operating at a comparatively high rate since September, 1926, continued to report near-record operations, the rate of activities in November having been exceeded only during January, 1927. An opposite trend was reported by the textile mills of New England, however, the rate of operations in that section during November being 14 per cent under October and 13 per cent under November, 1926.

*Indexes of Productive Activity in the Southern States*

All Figures Adjusted for Number of Working Days

| | Nov. 1927 | Oct. 1927 | Nov. 1926 | Average for First Eleven Months of 1927 | Average for Full Year 1926 |
|---|---|---|---|---|---|
| All industries | 137.0 | 134.6 | 134.2 | 127.6 | 115.9 |
| Fertilizers | 106.2 | 97.0 | 238.0 | 108.2 | 184.3 |
| Metals group | 111.4 | 117.4 | 145.0 | 128.2 | 129.5 |

## *Era of Electrification at Hand*

AMERICAN railroads have come back. They have survived the attempt at governmental operation, a period of inadequate rates and years in which their credit and their business were in the doldrums. Railroad executives had the courage to overcome heavy obstacles, and national thanks are due them for their remarkable achievements.

The end is not yet, for in a recent statement General W. W. Atterbury pointed out many things which should be done to better transportation and make it more economical. Among these he put electrification, and well-founded rumors presage a major electrification program for the Pennsylvania Railroad in the near future. Other railroads are also ready for electrification in that several systems have worked out a fundamental plan and analysis to show where and when electrification is warranted. The Illinois Central terminal electrification in Chicago is going to be followed by other terminal electrifications because published results of electric operations in Chicago are convincing.

Not all railroad lines should be electrified. But heavy-traffic terminals in large cities, heavy-traffic main lines and lines with steep grades are prospects for electrification over which the electrical industry can keep busy for several years. Energy will be purchased from light and power systems in most cases, and the requirement of automatic train control makes it necessary to revise signal and structural arrangements on all railroads so that electrical overhead systems will be readily installed. The time is ripe for a major electrification program.

## *Creation of Markets Opens Engineers' Fields*

ENGINEERS, as distinguished from scientists and technicians, justify their profession to the extent that they apply science to economic and social needs. In so doing they will enhance civilization as measured by the extent to which people enjoy happiness and can adapt themselves to the conditions of the time.

Particularly of late, there has been wider recognition of the fact that engineers must consider not only technical problems but economical organization or administration, finance and production. Each is essential, but a warning must be sounded not to make a fetish of organization, which is only a skeleton or framework into which individual human effort must be fitted. Through the recent revolution in financing methods every man on the street has become a capitalist, making corporate and public relations the concern of all. Production is the foundation of wealth and civilization, so that a community will enjoy both only as the average individual contribution of effort is high. Therefore engineers will do well to think of their mission in life as one to increase the productivity of their fellow men through scientific applications rather than to magnify the means to the end.

Even though our country affords the proof that substituting mechanical slaves for human slaves has brought the average laboring man the highest standard of living existent anywhere, some nations are being held back industrially and socially because of labor's belief there that increasing the productivity per worker through machinery will permanently displace workers. Obviously, there will be no work for those displaced unless something has been done to increase the need for workers. This something has involved increasing the demand for products and the development of new products through research. Merchandising, therefore, is an all-important activity which engineers must add to the already recognized factors influencing engineering development. Without an outlet for things produced or service made available, there is little need for production, and hence the engineer. There is no danger of "overselling" the American public so long as the productivity per worker is increased and thus the ability to augment his income.

## *Governor Smith's Futile Water-Power Program*

GOVERNOR SMITH in his annual message to the Legislature of New York made an admirable presentation of his accomplishments as the chief executive of the Empire State. As a report of work done and hopes deferred the Governor's message merits commendation. That many of his recommendations have come to naught is not indicative of any lack of sincerity on his part, but of the fact that the Legislature has had a different view. In a measure it is well that this has been so, because some of Governor Smith's recommendations indicate a socialistic rather than a democratic tendency, and the plausibility with which he presents and argues for them makes them all the more insidious. For example, his recommendation for a state Water Power Authority empowered to use its own securities against the proved economic value of state water-power development is unsound and reveals the politician rather than the statesman. There is a tendency toward a super-government in the shape of "authorities," which apparently owe no responsibility to the people or to the Legislature and some of which are not even performing the work for which they were created.

The Port Authority, to cite one notable example, was appointed to wrestle with the port problem. To date it has done absolutely nothing along that line, but has taken up work like bridge building, which, however laudable, was never contemplated in the original legislation, and it has issued securities for that purpose at very low rates because people believe that the credit of the state is back of them. This is contrary to the fact. The proposed Water Power Authority would add to the existing bureaus, and although it might not have power to assess those benefited, as do the river control authorities, it would nevertheless be able to float securities on proposals which might conceivably be of questionable merit, for how can one prove the economic value of water-power development not in existence?

In addition, the Governor proposes to rob the Public Service Commission of some authority, because the Water Power Authority would have full control of rate regulation and of other problems arising in connection with state ownership and state control of water power. Further encroachment on state regulation is suggested by permitting localities to fix rates for public utility services within their borders. These are blemishes on an otherwise admirable record and it is fortunate for the public as well as for the public utilities operating in the state that the Legislature has not heretofore seen eye to eye with Governor Smith concerning these ideas. As a matter of practical politics also there is little likelihood of the present Republican Legislature passing many of the proposed measures or in any other way giving aid or comfort to a Democratic Governor with presidential aspirations.

## *Efficient Service and Satisfied Personnel*

LABOR rarely has been a subject of controversy in the electric light and power industry. This has been so chiefly because the industry does not require much labor in the manufacture of its product and also because it realizes that efficient electric service largely depends upon a satisfied and efficient personnel. It is vain to expect alert, courteous, conscientious and willing service from employees inadequately paid or whose faithfulness to duty is unappreciated or unrecognized. Public utility service is vital to home, community and industrial life, and wherever possible every effort should be made to make that service better and more reliable. Adequate wages are, of course, essential; but faithful and intelligent effort is entitled to something more. The first may be demanded as a matter of right; the second will not be withheld by a wise management.

There are in existence among electric public utility and manufacturing companies many plans for improving employee relationships. Some involve pensions, others profit sharing, and still others employee partnership. One of the most successful plans is that followed by the Brooklyn Edison Company. In 1910 that company adopted a system of sharing its profits with its employees, and it has followed it ever since. More than half a million dollars was voted for that purpose recently. every employee who has served the company faithfully for two years receives, in addition to his regular pay, a percentage of his salary, depending on length of service, ranging from one-quarter to the full dividend rate paid on the capital stock. This is invested in the securities of the company, and as a result the Brooklyn Edison Investment Fund held, at the end of 1926, 2,338 shares of stock and $722,000 in bonds for the benefit of 5,200 employees. In addition, 1,100 employees individually owned 8,779 shares of stock, making a total of 11,117 shares of stock held either directly by or for the benefit of employees.

There are, of course, other ways of obtaining and holding the loyalty of employees which are just as democratic and effective in building up esprit de corps. Indeed, the Brooklyn Edison Company itself shows its interest in its employees' welfare in many other ways. The essential feature of any plan, however, must be a frank and just recognition of diligence and faithfulness on the part of employees, with no suggestion of condescension or paternalism. Employees should be able to feel that they can make public service their life's work. It is a great tribute to the management of any company to be free from labor troubles, but it is a much greater accomplishment to possess a satisfied, loyal, enthusiastic and willing organization, and such an organization management may obtain if it merits it.

* * * *

## *Intangibles in Purchasing*

AS THE art of electrical design develops, intangible factors assume greater importance to the discriminating buyer, be he a representative of the industry or a customer of one of its branches. In the machinery and apparatus fields the purchasing agent is considering many other points besides price, and slowly the general public is coming to realize that other elements than first cost ought to be weighed in sales transactions. It is a handicap that no common unit of measurement is available in dealing with many of the indefinite factors which influence buying, but an approach is being made by the use of the point system in balancing intangibles after the arithmetical elements in competitive bids have been listed and analyzed.

The point system has the advantage of being simple to apply, although the values obtained by its use are likely to vary widely among buyers. Individual judgment largely determines the weight given in specific cases to such items as the reputation of the manufacturer, the amount of previous experience the buyer or others in the industry have had with the product offered, the probable life of the equipment or commodity in question, value of accessibility, safety aspects, absence, or presence of fire risk, effect on the contentment, welfare and efficiency of employees, appearance of the design, and adaptability to further improvements. This is not as serious an obstacle to intelligent purchasing as might appear on the surface. The personal equation of the buyer affects the prorating of points, but such prorating can be made virtually free from bias where the purchasing agent is untrammeled by his superiors and accustomed to attacking the buying problem in a scientific manner.

In other words, a fair comparison can be made on the point system of even extremely elusive factors bearing upon the selection of a particular commodity or service, just as essays are evaluated point by point in prize competitions decided by committees working first as individuals and then in camera. In harmonizing individual interpretations of intangible value into unanimous or majority group action, as in discussing bids in a conference attended by the purchasing agent, engineering staff representatives and executives, it is only necessary to agree upon the number of points to be accorded to particular items and then to eliminate as fast as possible items valued alike or approximately alike by those in session, following with items in dispute. Upon final vote the last item in disagreement should be disposed of and the docket cleared for a fair decision taking into account all known elements in the purchase task.

## Outdoor Advertising a Revenue-Builder

ELECTRICAL advertising contributes about 4 per cent of the gross revenue which central-station companies receive from lighting in this country. This amounts to nearly forty million dollars, or to about one month's residence lighting bill. When we think of electrical outdoor advertising, the spectacular sign comes to mind and the bulletin and poster boards remain in the background. The latter are less spectacular, but they greatly predominate in the field. Even now the illuminated board contributes more revenue than the spectacular electric sign. It has the advantage of smaller cost and greater flexibility. The so-called electric sign is largely a night-shift worker. The illuminated bulletin board works two shifts—day and night—and its low cost makes it possible for it to invade many communities where the spectacular sign cannot be justified economically.

The revenue-building possibilities of bulletin boards are found in various directions. A large percentage of them are not illuminated and therefore are not working when they can be most effective. An illuminated board has high value as an attractor of attention because it stands out relatively alone. The distracting and competitive surroundings and background are largely lost in darkness. Then there is the matter of intensity of illumination. Contrast is of primary importance in obtaining attention. By increasing the amount of light the contrast is increased, and the speed of vision is likewise favorably affected.

Finally, there is a great field of development in the use of artificial light sources and lighting to add touches of the so-called electric sign to the illuminated board. The running border of light sources has already arrived. Trademarks and other devices may be emphasized by transparencies or by light sources. Silhouette letters and many other devices besides floodlighting are available. Complete effective development of the bulletin board is still to come. It is a logical movement which will bring to each locality electrical advertising in which economic considerations and visual appeal are justifiably blended.

## The Metermen's Goal

THE extensive adoption of the four-wire, three-phase system of distribution, whether primary or secondary, has brought with it a number of problems for the meterman, as the choice of the proper meter to use on this system cannot be decided without considerable investigation of what equipment is available and what is best suited to the conditions. In the case of the Memphis Power & Light Company, where a large four-wire, three-phase network system is in operation, all of the possible schemes of metering received consideration. The final choice, as pointed out in an article elsewhere in this issue, was made on the most expensive method in so far as first cost is concerned. The reasons can all be given in one word—accuracy. It is the first consideration of a meterman. Of course he must consider the cost, but it never pays to sacrifice real accuracy for a small saving of investment cost.

As an indication of what modern metering requirements are, a case may be quoted from one utility that supplies a customer with 18,000 kw. at a high load factor and with a high power factor. The metering is done at 44,000 volts and is somewhat complicated because of the necessity of totalizing the power used on two feeders and measuring the maximum simultaneous kilovolt-ampere demand. The customer rather seriously questioned the accuracy of the equipment that was being used and finally spent about $6,000 purchasing and installing entirely independent equipment to meter the consumption by a different method and with apparatus of a make different from that used by the utility. The latter's equipment was in nowise disturbed. At the end of a week's operation the customer' meter showed 0.15 per cent less power than the utility's meter. The customer had been looking for a difference of from 12 per cent to 15 per cent. Such accuracy is not always secured, but a difference of less than 1 per cent between metering equipments can certainly be consistently secured by proper metering methods.

* * * *

## Commercial Versus Theoretical Research

RESEARCH has become a necessary auxiliary to management and operation in the industrial organism. More than a thousand companies have research divisions, 70 trade associations spend about $15,000,000 a year in research, 152 colleges spend about $1,500,000 for the same purpose, and several government departments participate. About $200,000,000 annually is now spent for research in this country. Electrical men have contributed greatly to the cause. Their industry is fortunate in that it deals with a new science which can be put to work only by the use of imagination and precision measurements. They have learned by experience that research is a profitable commercial activity and that it acts as the key to market supremacy. As a consequence research is an established auxiliary in all branches of the industry.

Commercial research should be divorced from theoretical research. They mix like oil and water. Commercial research should be tied directly to production and market objectives and must measure itself in dollars and in other commercial values. This class of research requires men who know manufacture and marketing as well as science. Their work must be focused on visualized objectives in the factories and on the properties. But general theoretical research should have no commercial ties. It is a job for scientists who sit on top of a mountain and try to pierce the unknown in every direction. These men are fact finders through the application of principles. Only general fields of science may be outlined for their guidance, and results depend entirely upon their individual limitations and upon interpretation of chance discoveries.

In the world of industry commercial research is needed by all groups and is an auxiliary to progress in every branch. But theoretical research is the true research and should not be placed second in any industry program. Each business should support some commercial research as part of its activities, but in addition industry should support theoretical researches. In the colleges an admirable atmosphere for the growth of this type of research exists, but they are too poor to do the tasks, and frequently they are too busy teaching to be concerned with research. Both the government and industry should study the research situation in order to provide means to place pure or theoretical investigation on an adequate basis. It only has permanent value and it deserves the utmost in co-operative support.

# *Oxford Shoals Plant*

## *of the Southern Power System Nearing Completion*

THE 45,000-kva. hydro-electric development of the Duke (formerly Southern) Power Company on the Catawba River between the existing Rhodhiss and Mountain Island plants will probably be placed in operation next April. On Nov. 1 about 100,000 cu.yd. of concrete had been poured out of the total required (200,000 cu.yd.) and 80 per cent of the total excavation (more than 100,000 cu.yd.) had been completed. The dam is 1,600 ft. long and the normal operating head will be 90 ft. The power-house structure will contain two 22,500-kva. generators and their corresponding 6,600/110,000-volt transformers installed as a unit. Switching will be performed on the high-tension side of the transformers.

# Unit-type Pulverizers Used in Kalamazoo Plant

New Michigan power house combines excellence in design with speed in construction. First use of powdered fuel by Consumers Company is unit type. Turbine bleeding in fullest use

By J. W. Mackenzie and W. E. Jacobs
*Consumers Power Company, Jackson, Mich.*

THE placing in operation of the new Kalamazoo steam plant of the Consumers Power Company on June 1, 1927, was marked with special interest by the members of that company and others not only because it was the first venture of the company in pulverized-fuel operation but also because it represented a new high standard, at least for that company, in the way of rapid plant construction. To build a 20,000-kw. plant, including foundations, between Oct. 1 and June 1 meant a very unusual construction period. Early deliveries became an important part of all contracts. The closest possible co-operation among the designing engineers, the construction department and the operating department was necessary in order that decisions might be reached early and plans scheduled in such a way as to deliver to the construction department all drawings in the order in which they were required for work. On the evening of June 1, 1927, the turbine was synchronized on the line and took its share of the system load.

### Factors Determining Station Design

The site of the new Kalamazoo plant was decided upon because the load studies of the system showed that additional capacity was required in this portion of the state. Also, sufficient transmission line facilities were already in service to take care of any excess power at this point. Railway service and an adequate supply of water for condensing operation were available here. The location of a plant at this site, together with three transmission lines, would insure the greatest possible reliability of service to the city of Kalamazoo. The company already owned the necessary property, and as there was a small plant at this location, it would not be necessary to provide an entirely new plant organization.

The other steam plants of the Consumers Power Company are stoker-fired, but in the design of this plant it was decided to use pulverized fuel for the following reasons:

1. In view of the results obtained from pulverized fuel in other companies, it was decided that this company should get some definite information of its own on this subject, and as the Kalamazoo plant would be built for its ultimate capacity, anything that was done in this plant would not commit the company in future design.

2. The present plants of the company were all equipped with underfeed stokers and furnaces arranged to use only high-grade West Virginia coal, and although it is possible to design this equipment for burning lower-grade coals, the present stokers do not adapt themselves readily to the use of Ohio, Indiana or Michigan coals. Accordingly it was thought that by designing the Kalamazoo plant for pulverized-fuel operation it would be possible to use some of the low-grade coals at such times as the coal market made their use economical.

3. Since this plant would have a single generating unit, it was possible to bleed the high stages of the turbine for feed-water heating without the complications that exist where more than one turbine is used. This made the use of economizers undesirable, and the installations of a high boiler and an air preheater without economizers would result in preheating the air to temperatures higher than was thought desirable to use with underfeed stokers. It will be noted from the cross-section, and also from the piping diagram that this plant is extremely simple to operate. A boiler pressure of 400 lb. was decided upon, because the standards for this pressure were well established, and although it was realized that efficiences would not be so good as in plants utilizing higher pressures or a reheat cycle, it was felt that, with a plant of this size and character of loading, these added complications could not be justified.

The generating equipment consists of a 20,000-kw.. bleeder-type, three-phase, 60-cycle turbo-generator, which feeds directly to the 5,000-volt bus from which all distribution circuits are taken. Any generation not required for the local load is taken from the main bus through three sets of transformers to the 40,000-volt and 140,000-volt transmission systems.

### Full Turbine Bleeding Used

The turbine receives steam at 350 lb. gage and 725 deg. F. total temperature. It is a fourteen-stage impulse machine arranged for bleeding from the fourth, seventh and eleventh stages for furnishing steam to operate a make-up water evaporator and to heat the feed water. The turbine exhausts into a two-pass surface condenser of 25,000 sq.ft. cooling surface, 23,500 sq.ft. of which is in the main condenser and 1,500 sq.ft. in an external air cooler. The condenser is equipped with a set of steam ejectors, which consists of two primary and two secondary jets together with inter- and after-condenser units for condensing the steam of the jets, condensate from the main unit being used for this purpose.

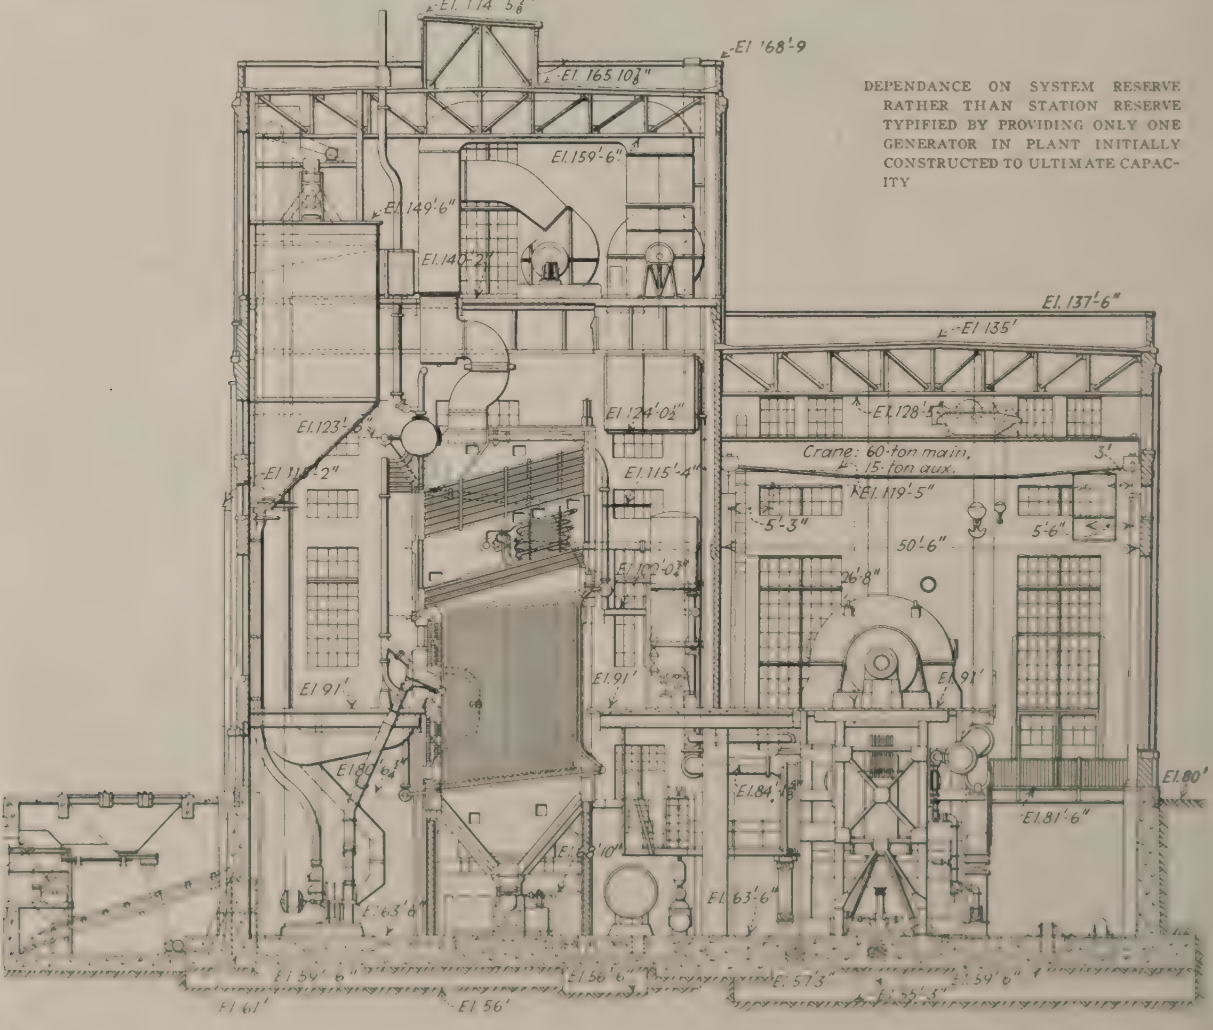
An underground concrete duct takes water from the Kalamazoo River after it has passed through traveling screens, which are installed in a separate screen house located about 130 ft. from the plant, and conducts the water to the plant for condenser cooling and for the plant raw water service. The circulating water is supplied by either or both of two centrifugal pumps of 15,500-gal.-per-minute capacity each, which are driven by 440-volt, 125-hp., constant-speed alterating-current motors direct connected to the pumps. These pumps are located in the turbine room basement and below river level.

The condensate from the main unit is handled by either of two 600-gal.-per-minute centrifugal hot well pumps driven by constant-speed alternating-current motors. The condensate passes through the ejector condensers and then through the eleventh stage bleeder heater to the boiler-feed pumps. From these pumps it passes in turn through the seventh and fourth stage heaters to the main boiler-feed header. Any heater may be bypassed and cut out of service, and in case of emergency the boiler-feed pumps can discharge directly into the auxiliary boiler-feed header without passing through the seventh or fourth stage heaters. Normally the water is fed into one end of the boiler drum through a single feed line fitted with a Venturi meter, a constant differential pressure control valve and a Copes boiler-feed regulator, or in emergencies, it may be fed by hand control through an auxiliary line into the other end of the boiler drum.

To assure de-aëration of the condensate, the condenser is equipped with a special type of hot well guaranteed to reduce the dissolved gases in the water to below the danger point. In order that the make-up may also be free from oxygen and corrosive gases, special arrangement is made for taking the make-up water from an outside pure water storage tank and spraying it into the top of the condenser. A surge tank is located in the top of the boiler room and is connected to the boiler-feed header. When the level in this tank falls below a safe working level, a float-controlled regulator opens a valve in the line from the storage tank to the condenser and make-up is drawn into the condenser by the vacuum. If the level in the surge tank rises nearly to the point of overflowing, the float-controlled mechanism opens a valve in a line joining the discharge of the condensate pumps with the outside storage and some of the condensate is pumped into the outside tank.

The boiler-feed pump equipment consists of two six-stage motor-driven and one four-stage turbine-driven centrifugal pumps, each designed to deliver 600 gal.-per-minute at a total head of 1,185 ft. with a positive head of 35 ft. on the suction. The motors are 440-volt, 1,150-r.p.m., 300-hp., constant-speed alternating-current, motors, and the turbine is a 300-hp. non-condensing turbine operating at 2,400 r.p.m. The turbine-driven pump is held as a spare for immediate service in case of trouble with the motor-driven pumps.

The fourth stage of the turbine is bled to furnish steam



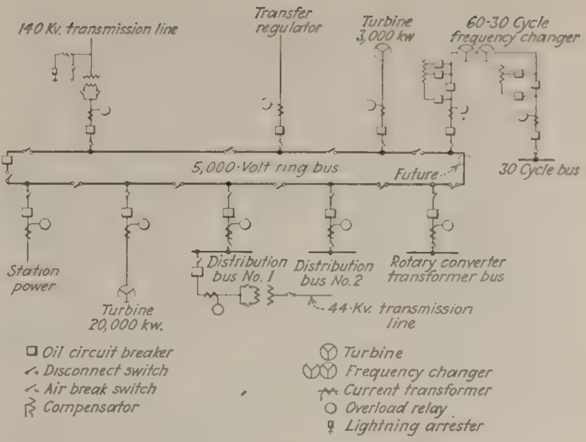
DEPENDANCE ON SYSTEM RESERVE RATHER THAN STATION RESERVE TYPIFIED BY PROVIDING ONLY ONE GENERATOR IN PLANT INITIALLY CONSTRUCTED TO ULTIMATE CAPACITY for heating the feed water in the high-pressure heater and for the evaporator. This heater, as well as the intermediate or seventh stage heater, is of the floating-head closed type built for 150 lb. steam pressure and 600 lb. water pressure. The drips from this heater are trapped into the intermediate or seventh-stage heater.

The evaporator is of the single-effect submerged-coil type, having a capacity of 12,000 lb. per hour. The vapor is piped into the seventh-stage heater, as is also the coil drain. The raw-water supply is obtained from an open heater and is pumped into the evaporator by means of a 50 gal. per minute motor-driven centrifugal pump through a float-controlled valve, which maintains a constant level in the evaporator shell. The open heater receives exhaust steam from the reciprocating house-service pump and also from the steam-driven boiler-feed pump when it is in operation.

The eleventh stage heater receives the drips from the seventh-stage heater and steam from the turbine bleeder and passes its drips into a small motor-driven hot well pump, which discharges into the boiler-feed pump suction header. In case the drip pump is out of service, the drips can be passed through a 15-ft. sealing loop into the hot well of the main condenser. Each heater is vented into the heater next lower in pressure or all of the heaters may be vented into the main condenser.

The boiler equipment consists of three 1,536-hp. cross-drum boilers designed for 400 lb. working steam pressure, which are set so as to be fired under the downtake end. The boilers are 24 section (two tubes per section) in width and are twenty tubes high, fourteen rows above and six rows below an intercheck superheater. One tube in each of the four bottom rows in each section is omitted, thus forming a slag screen to prevent slag bridging across the bottom tubes annd restricting the gas passage through the first pass. The omission of these tubes makes it the equivalent of a standard eighteen-tube high boiler. The boilers are baffled so as to make three passes, the horizontal baffle being above the lower deck of tubes, thus exposing the entire deck to radiant heat from the furnace.

In addition to the boiler heating surface, the side and rear walls consist of fin tube water-cooled surface, and a Lopulco type water screen is provided across the bottom of the furnace to prevent clinkering of the ash. The total water-cooled surface around the furnace is approximately 1,770 sq.ft., all of which is a connection into the boiler circulation, thus giving a boiler unit having 17,130 sq.ft. of heating surface.



MAIN STATION BUS ARRANGEMENT

Above each boiler is a large plate-type air preheater with 21,600 sq.ft. of effective heating surface and having 150 elements, the plates of which are 16 ft. high and 5 ft. wide, both air and gas passages being ½ in. in width. It is expected that this preheater will reduce the flue gas temperature below 300 deg. F. at the normal boiler ratings and will preheat the air to about 425 deg. F.

The coal-pulverizing equipment consists of two four-ton per hour capacity Type 5-A Simplex unit pulverizers per boiler located on the boiler room basement floor. The mills are driven by 440-volt, 100-hp., constant-speed alternating-current motors operating at about 1,150 r.p.m. The fans on the end of the mill shaft draw about 800 cu.ft. of air per minute through the mill and about 12,000 cu.ft. per minute from the hot air duct, the two streams of air joining at the discharge of the mill and constituting

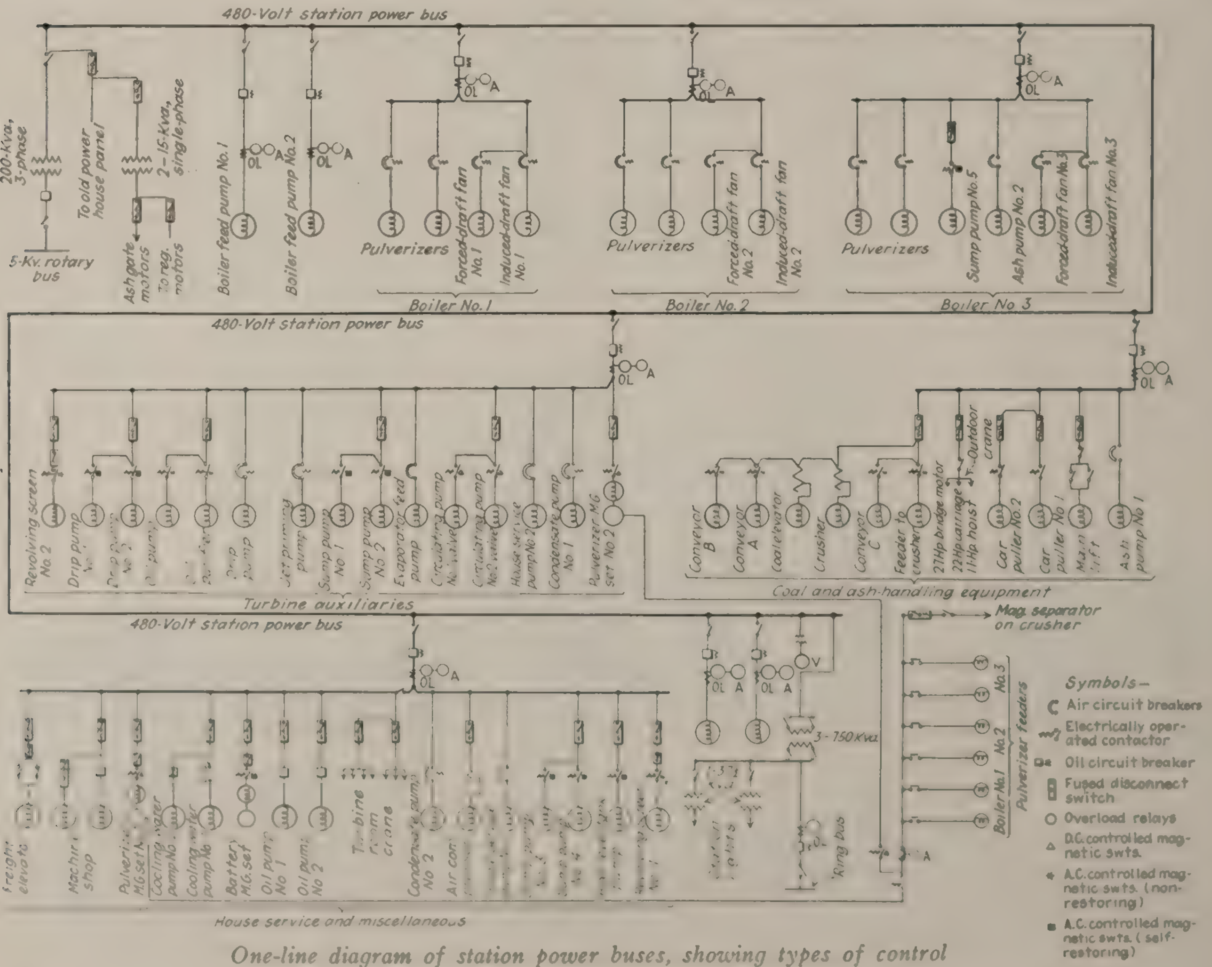
KALAMAZOO PLANT OF CONSUMERS POWER COMPANY the primary air supply to the burners. The primary air is from 35 to 70 per cent of the total air for combustion, depending upon the amount of coal being burned.

There are four horizontal turbulent-type burners per boiler located in the front wall of each furnace just above the boiler room floor and arranged with the axis of the burners inclined downward 20 deg. from the horizontal, two burners to each pulverizer. Each boiler is equipped with individual forced and induced-draft fans, which are located on the air preheater floor above the boilers. The forced draft fans take air from the top of the boiler room and force it through the air preheater and through two large ducts per boiler down the front of the boiler room to the burners. These fans have a capacity of 55,000 cu.ft. per minute at 100 deg. F. They are driven by 440-volt, 125-hp., alternating-current slip-ring motors with a maximum speed of 1,150 r.p.m. and a speed variation of 50 per cent. The induced draft fans take the gases from the air preheater and discharge them into a breeching leading to a single concrete stack. These fans each have a capacity of 100,000 cu.ft. per minute at 380 deg. F., and are driven by 440-volt, 250-hp., alternating-current slip-ring motors with a maximum speed of 585 r.p.m., and a speed range of 50 per cent. Additional draft control is obtained by means of electric-operated dampers in both the forced and induced draft ducts controlled by push and pull-buttons located on the boiler control panel.

Coal is received at the plant in hopper-bottom cars on either of two tracks, each of which is fitted with a track hopper. One track is between the coal storage pile and the boiler room and the other is located on the other side of the storage pile. The outside track hopper is connected to the discharge of the nearest hopper by means of an underground belt conveyor. From the track hoppers coal is fed to a 50-ton capacity rigid hammer type crusher and then to a bucket elevator, by means of which it is elevated to the top of the boiler room and discharged to a distributor belt, which distributes it to the three bunkers. At the receiving end of the distribution belt the coal passes over a Merrick weightometer for automatic weighing. Bailey coal meters are also installed in the coal spouts to the pulverizers in order to weigh the coal to the individual pulverizer units. · An overhead bridge-type crane, equipped with a 2-yd. bucket, spans a coal unloading trestle, the storage pile and one of the track hoppers, thus providing facilities for handling coal from the cars to storage and reclaiming from storage to the track hopper.

Motor-operated ash gates, located at the bottom of the furnace hopper below the water screen, drop the ash into a sluiceway through which part of the condenser circulating water is passed. The sluiceway discharges into a pit, from which the water and ash are picked up by two 8-in. dredge pumps and discharged on adjoining low ground. Here the ash settles out and the water slowly drains back into the river.

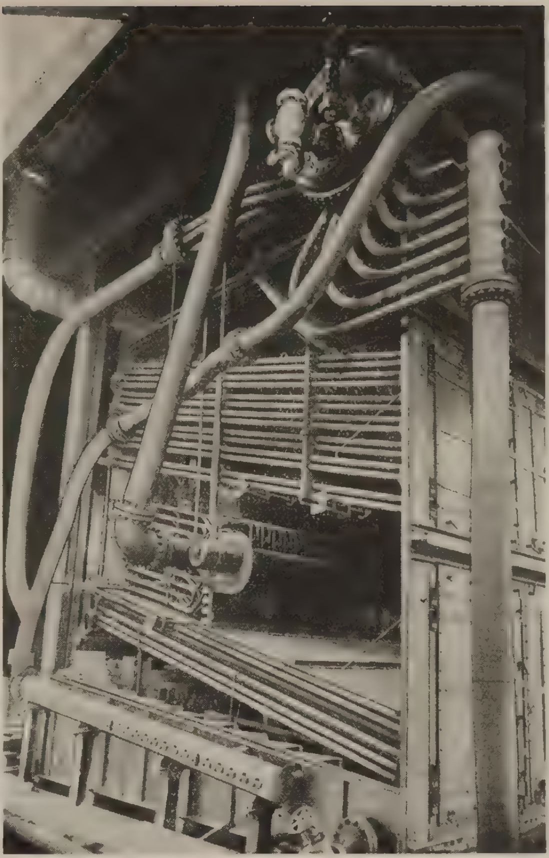
The various station power auxiliaries are arranged in



*One-line diagram of station power buses, showing types of control* six groups, each connected to the main station power bus through an oil-circuit breaker as shown on the drawing. This arrangement is expected to reduce interruptions to the station power by permitting only the oil-circuit breaker controlling the group at fault to trip. The station power bus is supplied with power at 480 volts by two banks of transformers. One bank consists of three 750-kva. single-phase transformers and connects directly to the station ring bus through an automatic oil-circuit breaker. The other bank consists of one 200-kva. three-phase transformer and is connected to the rotary connecter transformer group bus, as shown in the diagram. The three-phase transformer is installed for stand-by and plant shutdown service.

The diagram of the station power layout shows the methods used to connect the various motors to the group buses. These are four different types of contactors used for motor starting, a contactor with an alternating-current closing coil which must be reclosed by hand in case the alternating-current power fails, a contactor with an alternating-current closing coil which will reclose the contactor upon the return of power after a failure, a contactor with a direct-current closing coil which will hold the contactor closed so long as there is a direct-current power, and a manually operated contactor. All motors are started across the line. The control for the oil-circuit breakers to the group buses, the oil-circuit breakers on the two circulating pump motors and other miscellaneous auxiliaries having electrically controlled contactors is centered on a station power switchboard, which is conveniently located in the generator room at the end of, and at right angles to, the main switchboard. On this board are also located the relays for the automatic oil-circuit breakers.

Two 10-kw. motor-generator sets, one of which is a reserve, each connecting to a different station power group bus, furnish direct-current power for the operation of the magnetic separators, the dampers and the pulverizer feeder motors. The control for these two motor-generator sets is so arranged that should the group bus to which the set being used is connected become de-energized, the other set will immediately start up, providing the group bus to which it is connected is energized.



BOILER, SUPERHEATER AND WATER-WALL CIRCULATING PIPING BEFORE BRICKING-IN

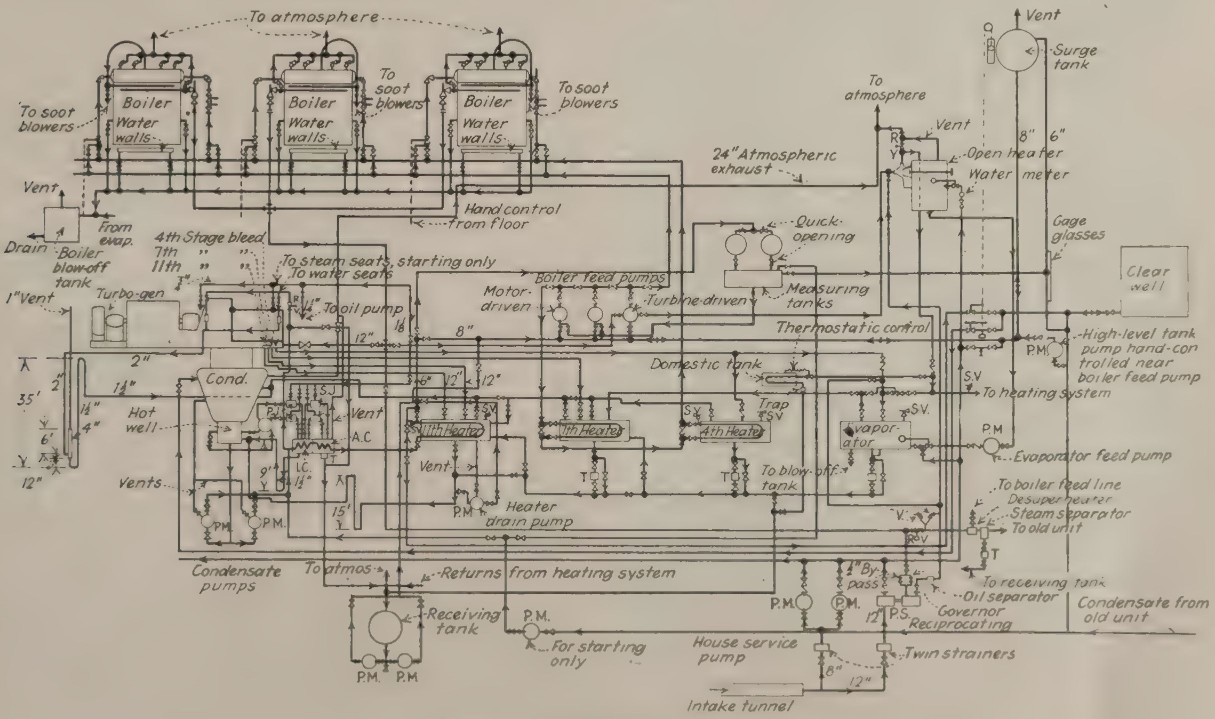


Diagram of Main Station Layout

The motors on the drum controllers for the forced and induced draft fans are operated from the station storage battery. It is necessary to operate these drum controller motors from the storage battery because in case the station power fails the drum controllers must return to starting position, all resistance in, before the fan motors can be started.

The generating rating is 25,000 kva., 5,000 volts, 2,890 amp., three phase, 60 cycle. The generator is excited by a 135-kw., 250-volt, direct-connected exciter, which, in turn, is excited by a 2-kw., 115-volt pilot exciter mounted on the frame of the main exciter. The two exciters insure stable operation under conditions that make it necessary to carry a weak field on the generator. The grounding system layout, including all motors in the plant, is very complete. At present the generator neutral is not grounded. Ground plates connected by pigtails to the ground network were located in each motor base when it was poured. Each motor frame is grounded with a copper cable to the ground plate. The generator is protected at all times against a fault in the windings by differential relays which trip both the generator oil-circuit breaker and the field switch. These are located on a separate panel apart from the main switchboard. The generator is protected against overload only during synchronizing. The tripping circuit from the overload relays is through a contact on the synchronizing switch.

The main station bus is built in ring form with disconnects between the points where the various circuits tap on. At present there is only one bus tie oil-circuit breaker, but ultimate plans call for two. There is a set of disconnects located where the future bus tie breaker will be installed, and this set is usually open, thus permitting the ring bus to be split by the other breaker.

From the sketch of the ring bus it may be seen that with the disconnects open between the frequency changer and the rotary converter transformer group, the bus tie oil-circuit breaker can be opened during cases of transmission line trouble, leaving the 20,000-kw. turbine on the half of the bus with the local distribution. The 140-kv. transmission line and frequency changer would then be left on the other half. A transfer regulator connecting to the main ring bus, a transfer bus and transfer oil-circuit breakers on each distribution circuit provides a means of transferring any distribution circuit to the transfer regulator. A 44-kv. transmission line connects to the distribution group bus instead of to the main ring bus. This allows for carrying this group bus off this transmission line while the group oil-circuit breaker is being removed for inspection or repair. The station lights may be supplied from either of two banks of 37-kva. transformers, which are connected to the station power bus or from the steam-driven exciter, which is an auxiliary for the 3,000-kw. generator.

As previously stated, the plant was started on June 1, and although some starting troubles were experienced, these troubles were not serious, and after a few days' time the plant was put into regular full-load operation and has operated according to system demands since that time. Although the boiler efficiencies are not yet all that was expected, due to some adjustments that are necessary in connection with the fuel-burning equipment, these troubles are not serious nor anything that should be difficult to overcome. The plant efficiency is much better than has been the experience of this company with a plant so soon after it was started. At the time of the design of the plant it was contemplated it would be possible to generate 1 kw.-hr. with 1¼ lb. of good quality coal, and the present results show that it will be easily possible to reach this figure. These are not the highest efficiencies as considered today, but for a plant of this size are very satisfactory results for the pressures and conditions that were adopted in the design. This plant was designed by the engineering department of the Commonwealth Power Corporation and built by the construction department of the Consumers Power Company.

## *Data on Principal Equipment in Addition to Kalamazoo Station Consumers Power Company*

### *Turbo-Generator*

| | |
|---|---|
| Manufacturer | General Electric Co. |
| Number | 1 |
| Rated capacity, kw. | 20,000 |
| Rated capacity, kva. | 25,000 |
| Voltage | 5,000 |
| Phase | 3 |
| Frequency | 60 |
| Revolutions per minute | 1,800 |
| Steam pressure, gage | 375 |
| Superheat, deg. F. | 250 |

### *Direct-Connected Exciters*

| | |
|---|---|
| Main exciter | |
| Rated capacity, kw. | 135 |
| Voltage | 250 |
| Amperes | 540 |
| Pilot exciter | |
| Rated capacity, kw. | 2 |
| Voltage | 125 |
| Amperes | 16 |

### *Generator Air Coolers*

| | |
|---|---|
| Manufacturer | General Electric Co. |
| Cooling surface, sq.ft. | 11,700 |
| Number of passes | 4 |
| Kind of tubes | Admiralty |
| Diameter of tubes | 1 in. |
| Cooling water supply | Raw water |

### *Condensers*

| | |
|---|---|
| Manufacturer | Wheeler Cond. & Eng. Co. |
| Tube surface, sq.ft. | 25,000 |
| Connection to turbine | Rigid |
| Support | Springs |
| Kind of tubes | Admiralty |
| Diameter of tubes | 1 in. |
| Water passes | 2 |

### *Circulating Pumps*

| | |
|---|---|
| Manufacturer | Wheeler Cond. & Eng. Co. |
| Number | 2 |
| Speed, r.p.m. | 400 |
| Capacity, g.p.m. (1 pump) | 15,500 |
| Drive | 440-volt, 125-hp. a.-c. motor |

### *Condensate Pumps*

| | |
|---|---|
| Manufacturer | Wheeler Cond. & Eng. Co. |
| Number | 2 |
| Type | 2-stage centrifugal |
| Speed, r.p.m. | 1,150 |
| Capacity, g.p.m. (1 pump) | 600 |
| Drive | 440-volt, 40-hp. a.-c. motor |

### *Air Ejectors*

| | |
|---|---|
| Manufacturer | Wheeler Cond. & Eng. Co. |
| Number | 1 |
| Type | Twin 2-stage jets with inter- and after-condenser |
| Capacity | 25 cu.ft. free air at 28.5 in. vac. |
| Steam consumption (2 jets) | 1,280 lb. per hour |

### *Boiler-Feed Pumps*

| | |
|---|---|
| Manufacturer | Pennsylvania Pump & Compressor Co. |
| Type | Centrifugal 2 six-stage, 1 four-stage |
| Discharge head | 1,185 ft. |
| Suction head | + 35 ft. |
| Capacity (1 pump) | 600 g.p.m. |
| Drive | 2 440-volt, 300-hp. a.-c. motors, 1 300-hp. Kerr. tur. |

### *Feed-Water Heaters*

| | |
|---|---|
| Manufacturer | Griscom Russell Co. |
| Number | 3 |
| Surface | |
| 11th stage | 1,170 sq.ft. |
| 7th stage | 1,080 sq.ft. |
| 4th stage | 1,016 sq.ft. |

### *Evaporator*

| | |
|---|---|
| Manufacturer | Griscom Russell Co. |
| Number | 1 single effect |
| Location | Between 4th and 7th stages |
| Capacity | 12,000 lb. per hr. |

### *Boilers*

| | |
|---|---|
| Manufacturer | Springfield Boiler Co. |
| Type | Cross-drum |
| Number | 3 |
| Rated horsepower | 1,536 hp. |
| Size of tubes | 3 in., 9 gage |
| Steam pressure | 100 lb gage |
| Furnace volume | 8,750 cu.ft. |

### *Water-Cooled Walls*

| | |
|---|---|
| Manufacturer | Combustion Engineering Co. |
| Bottom Screen | |
| Type | Lopulco |
| Size of tubes | 4 in., 6 gage |
| Heating surface | 320 sq.ft. |
| Side walls (2) | |
| Type | Fin |
| Size of tubes | 4 in., 6 gage |
| Heating surface | 900 sq.ft. |

| | |
|---|---|
| **Rear wall** | |
| Type | Fin |
| Size of tubes | 4 in., 6 gage |
| Heating surface | 550 sq.ft. |
| Total water-cooled surface | 1,770 sq.ft. |

*Superheater*

| | |
|---|---|
| Manufacturer | Superheater Co. |
| Type | Elesco 4 loop |
| Location | Interdeck-Headers through setting |

*Air Preheaters*

| | |
|---|---|
| Manufacturer | Combustion Engineering Co. |
| Number | 3 |
| Type | Vertical plate, counter flow |
| Spacing (air passages) | ½ in. |
| Spacing (gas passages) | ½ in. |
| Height of elements | 16 ft. |
| Width of element | 5 ft. |
| Number of elements | 150 |
| Heating surface | 21,600 sq.ft. |

*Induced Draft Fans*

| | |
|---|---|
| Manufacturer | Clarage Fan Co. |
| Number | 3 |
| Capacity | 100,000 c.f.m. at 380 deg. F. and 8.5-in. draft |
| Maximum speed | 585 r.p.m. |
| Drive | 250-hp., a.-c. slip-ring motor |
| Speed variation | 50 per cent |

*Forced Draft Fans*

| | |
|---|---|
| Manufacturer | Clarage Fan Co. |
| Number | 3 |
| Capacity | 55,000 c.f.m. at 100 deg. and 8.25-in. pressure |
| Drive | 125-hp. a.-c. slip-ring motor |
| Maximum speed | 1,150 r.p.m. |
| Speed variation | 50 per cent |

*Stacks*

| | |
|---|---|
| Number | 1 |
| Kind | Concrete |
| Height | 267 ft. |
| Diameter inside at top | 12 ft. |

*Unit Pulverizers*

| | |
|---|---|
| Manufacturer | Furnace Engineering Co. |
| Number | 6 |
| Size | 5-A Simplex |
| Capacity | 8,000 lb. per hour |
| Drive | 100-hp. a.-c. induction motor |
| Kind of fuel | West Virginia bituminous |
| Heat value per pound as fired | 13,200 B.t.u. |

*Burners*

| | |
|---|---|
| Manufacturer | Furnace Engineering Co. |
| Type | Bailey-Tenney |
| Number | 12 |
| Capacity each burner | 4,000 lb. per hour |

*Coal-Handling Equipment*

| | |
|---|---|
| Manufacturer | Jeffrey Manufacturing Co. |
| Type of conveyors | Belt conveyors and bucket elevator |
| Crusher | Rigid hammer type |
| Capacity | 50 tons per hour |
| Coal scales | Merrick Weightometer |
| Coal meters | Bailey Meter Co. |

*Miscellaneous Equipment*

| Boiler meters | Bailey Meter Co. |
| Venturi meters | Builders Iron Foundry |
| Draft gages | L. M. Ellison Company |

# Pole-Setting Costs Cut 37 Per Cent

A LINE construction truck equipped with an earth auger saved a Middle Western utility $4,187 in ten months of operation and increased the speed of pole setting and the efficiency of the unit. The boring heads are universal in movement and adjustable to 45 deg. in any direction by means of a worm sector on each head. The latter also provides a means of rigidly locking the heads in any desired position. This universal movement means that the auger rack can be brought to a perpendicular digging position quickly.

According to the Four Wheel Drive Auto Company, this device will bore any hole and set the pole in any location where hand digging is possible and where it is practicable to place a truck. Cost data were as follows:

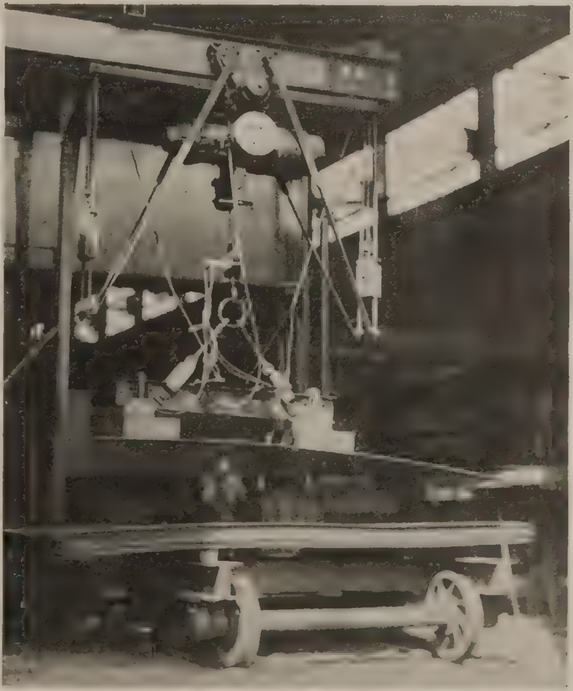
| | | | |
|---|---|---|---|
| Truck traveled, miles | 1,600 | Interest and depreciation per pole | $0.83 |
| Holes dug | 2,931 | Repairs per pole | $0.137 |
| Poles set | 3,102 | Total cost per pole | $2.287 |
| Poles replaced | 749 | Cost by hand method | $3.63 |
| Labor cost per pole | $0.89 | Saving by machine | $1.35 |
| License and truck expense, per pole | $0.43 | Saving on 3,102 poles | $4,187.70 |

The actual saving, however, was greater than this, as the machine was used considerably for maintenance work and the operating cost for this service is included in the totals. Twenty per cent of the poles set were replacements. The saving effected through the pulling of the old poles is not included in the $4,187.70.

# Crane Magnets Aid Metal Handling

PRESSED steel car ends and similar material in the form of steel plates are now handled by the Union Metal Products Company, of Hammond, Ind., in a manner that offers greater ease, speed and economy and has marked safety features.

Two rectangular lifting magnets, manufactured by the Electric Controller & Manufacturing Company, of Cleveland, are hung from a spreader beam, which in turn is suspended by a cable from a monorail hoist. The plates are charged into a heating furnace, one at a time, by an operator located in a control room opposite the end of the furnace. The floor man, who is customarily used to steady the plates as they are carried to the charging platform, has been eliminated by the introduction of a mechanical device. Two arms extend from the monorail hoist parallel to the track, and vertical slides are hung and rigidly braced at each end. A counterweight is suspended at each end from a cable that runs up over a pulley and down at an angle to the spreader beam supporting the magnets. This rigging has been found to be sufficient to hold the magnets in proper alignment and to damp swinging after one or two oscillations.



MAGNETIC CRANE ELIMINATES FLOOR MAN

# Forward and Reverse Operation Controlled by Single Button

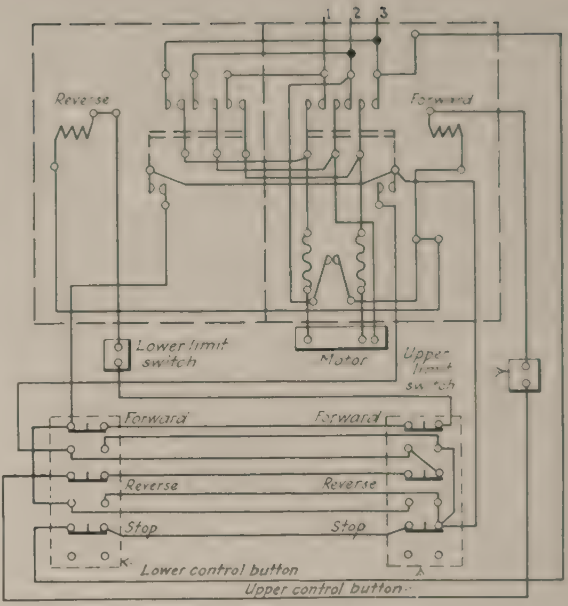
By H. W. Wikle
General Electric Company, Atlanta, Ga.

Operating practices in the plant of the Louisiana Pulp & Paper Company at Bastrop, La., required an unusual control plan for a chain conveyor driven through a worm gear by a 7½-hp. 440-volt, three-phase 60-cycle, squirrel-cage induction motor. This conveyor is 40 ft. long and rises to an elevation of approximately 9 ft. Control from the upper and lower terminals is desirable.

Referring to the starting point as "A" and the end as "B," it was desired (1) to start the conveyor in the forward or upward direction by means of a push button located at "A"; (2) stop the upward motion by a push button at "B"; (3) start the conveyor in the opposite or downward direction by the same push button at "B," and (4) stop the downward motion by the same push button at "A."

The accompanying diagram indicates how this result was accomplished through the use of a magnetic reversing switch, two limit switches and two push-button stations. One push button starts the motor forward and also stops the motor when it is running in the reverse direction. The other push button starts the motor in the reverse direction and also stops the motor when it is running forward.

The controls are so interlocked that with the motor running forward from one push button it must be stopped at the other one before the latter can be operative to reverse the direction of rotation of the motor. Likewise with the motor running in the reverse direction from the second push button it must be stopped at the first before starting the motor in the forward direction.



SCHEMATIC DIAGRAM OF TWO-BUTTON MULTIPLE ACTION CONTROL

# Four-Wire Metering

Various methods available discussed with data showing comparative accuracies obtained. The three-phase, four-wire, three-element meter adopted by the Memphis Power & Light Company

By E. A. Corum and F. L. Christenberry

*Meter Department Memphis Power & Light Company, Memphis, Tenn.*

MEASUREMENT of energy in three-phase, four-wire circuits may be done in any of the following four ways: (*a*) With three single-phase meters, (*b*) a three-phase, four-wire, three-element meter, (*c*) a three-phase, four-wire, two-element, split-coil meter having a third current coil with an equal number of ampere turns working with each potential coil but 60 deg. out of phase and (*d*) a three-phase, three-wire, two-element meter using three current transformers with their secondaries connected in delta. Based on the experience of the Memphis Power & Light Company, the first two methods, *a* and *b*, are the most desirable, because of the accuracy of registration.

Three single-phase meters, as used in *a*, are the easiest to test and can be calibrated to a higher degree of accuracy, there being no interference between elements and the necessary bucking and balancing of the elements are eliminated. As regards first costs of the four methods, the following figures may be used for comparison based on an 100-amp., 2,200-volt to 110-volt installation, the figures including only the cost of the meter or meters as the case may be, current and potential transformers and test blocks: Method *a*, \$170; *b*, \$185; *c*, \$145, and *d*, \$140. Labor and other materials will change the ratio between the various methods to some extent for the entire installation.

As noted, the first cost of the three single-phase meter method is less than the three-element meter method, but the method taken as a whole is less satisfactory, as there are more chances for error occurring in the preparation of the bills where the three readings must necessarily be added. Also, if the customer has separate power and lighting contracts, some confusion and expense may arise as to which meter is the lighting meter. In addition, with three single-phase meters the measurement of demand, which is necessary in most cases, requires special equipment. For these reasons and others that will be discussed later in reference to methods *c* and *d*, the Memphis company adopted the three-element meter when the three-phase, four-wire network system was installed in Memphis. (See Electrical World for Oct. 23, 1926, page 855, for a description of this system.)

From the standpoint of first cost, the three-element meter method is the most expensive, but, when all factors are considered, it is really the most satisfactory. Most of the objectionable features of the three single-phase methods are eliminated in this meter and all of the desirable features have been retained, except the ease of testing.

The results obtained from the use of three single-phase meters and from three-element meters, so far as accuracy of registration is concerned, are identical. As a typical example, assume a voltage from phases A, B and C to neutral of 100 volts and a balanced load of 5 amp. on each phase. From the power formula we have at unity power factor

$E_a I_a \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase A
$E_b I_b \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase B
$E_c I_c \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase C

or a total energy consumed and registered of 1,500 watts, the correct figure. If the voltage in phase A is increased to 110 volts, then

$E_a I_a \cos\theta = 110 \times 5 \times 1 = 550$ watts in phase A

with phases B and C remaining as above, giving the total energy consumed and registered of 1,550 watts, which is correct. If the voltages in phases A and B are both 110 volts, then

$E_a I_a \cos\theta = 110 \times 5 \times 1 = 550$ watts in phase A
$E_b I_b \cos\theta = 110 \times 5 \times 1 = 550$ watts in phase B

with phase C remaining as above, giving the total energy consumed and registered of 1,600 watts, the correct figure. Thus the three single-phase meters or the three-element meter will register correctly at all times any unbalance of voltage or load that may occur.

ACCURACIES OF TWO-ELEMENT SPLIT-COIL METER (FIGS. 1 TO 6) AND OF TWO-ELEMENT METER USING THREE CURRENT TRANSFORMERS CONNECTED IN DELTA (FIGS. 7 TO 12)

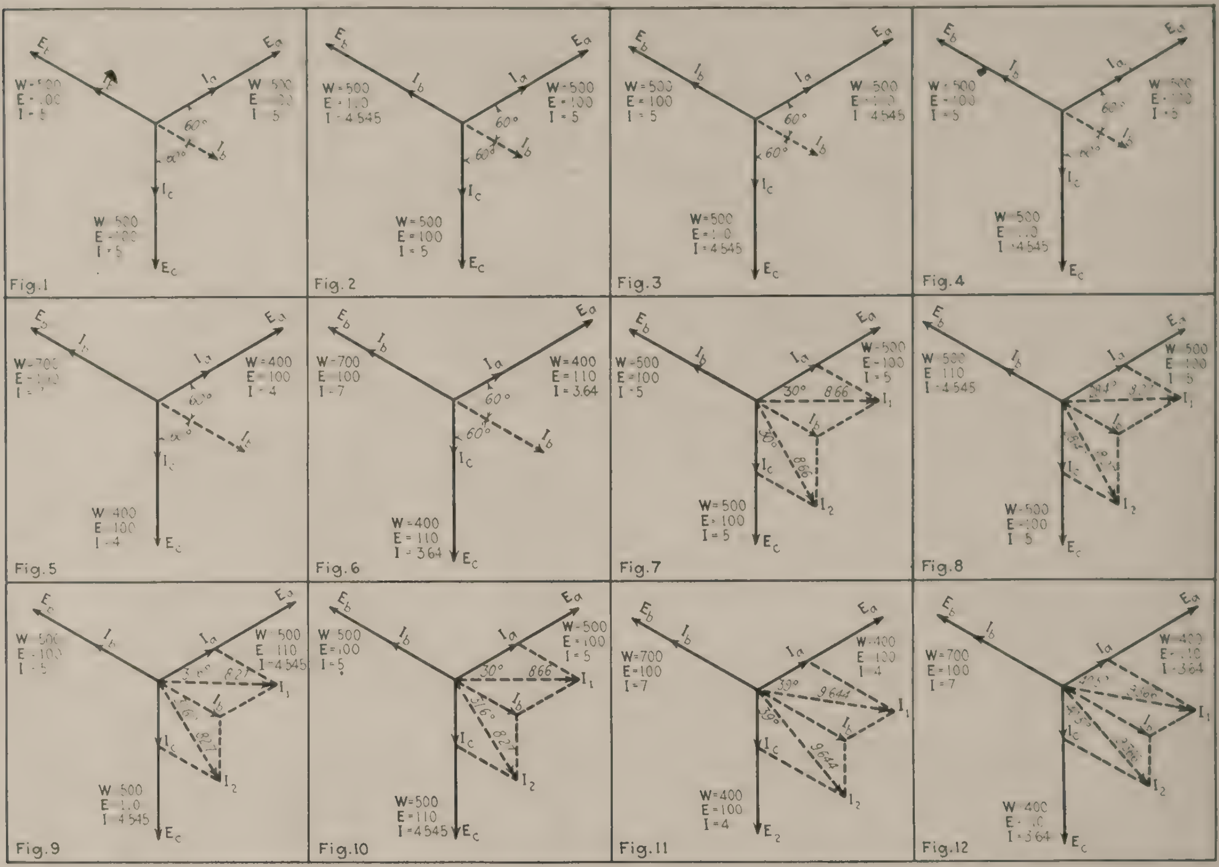
| Figure Number | Voltages | | | Load, Watts | | | Energy Consumed, Watts | Energy Registered, Watts | Accuracies of Registration, Per Cent |
|---|---|---|---|---|---|---|---|---|---|
| | A | B | C | A | B | C | | | |
| 1 and 7... | 100 | 100 | 100 | 500 | 500 | 500 | 1,500 | 1,500 | 100.00 |
| 2 and 8... | 100 | 110 | 100 | 500 | 500 | 500 | 1,500 | 1,454 | 96.93 |
| 3 and 9... | 110 | 100 | 110 | 500 | 500 | 500 | 1,500 | 1,550 | 103.33 |
| 4 and 10... | 100 | 100 | 110 | 500 | 500 | 500 | 1,500 | 1,525 | 101.67 |
| 5 and 11... | 100 | 100 | 100 | 400 | 700 | 400 | 1,500 | 1,500 | 100.00 |
| 6 and 12... | 110 | 100 | 110 | 400 | 700 | 400 | 1,500 | 1,570 | 104.67 |

The three-phase, four-wire, two-element, split-coil meter will register correctly providing the voltages are balanced, but it is very hard to adjust properly because as yet the manufacturers have provided no way for making any adjustment on the split coil. Also, this meter requires the carrying of spare parts that are not interchangeable with other meters. The accuracies of this meter under various conditions of voltage and load unbalance are shown in Figs. 1 to 6, inclusive, all examples being taken with unity power factor.

The three-phase, four-wire, two-element meter with three current transformers costs less than the three-element meter, but, like the split-coil meter, is not accurate with unbalanced voltages.

A fact not generally realized is that the split-coil meter and the delta-connected meter give the same accuracies under the same conditions of voltage unbalance. To illustrate this point the results obtained from the formulas used in conjunction with Figs. 1 to 12, inclusive, have been tabulated, this tabulation being given herewith.

The problems of metering three-phase, four-wire systems may be summed up as follows: The three single-phase meter is accurate, is easily calibrated and connections are easily made and checked, but it has the disadvantage of not recording total registration on one dial, requires more mounting space and is not suitable for



FIGS. 1 TO 12—RELATIVE ACCURACIES OF THREE-PHASE, FOUR-WIRE, TWO-ELEMENT, SPLIT-COIL METERS (1-6) AND THREE-WIRE, TWO-ELEMENT METERS (7-12) UNDER VOLTAGE AND LOAD UNBALANCE

Fig. 1—Voltages on phases A, B and C, 100 volts; balanced load of 500 watts on each phase.
$E_aI_a \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase A
$E_aI_b \cos\theta = 100 \times 5 \times 0.5 = 250$ watts plus
$E_cI_b \cos\theta = 100 \times 5 \times 0.5 = 250$ watts in phase B
$E_cI_c \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,500 watts; meter correct.

Fig. 2—Voltages on phases A and C, 100 volts; phase B, 110 volts; balanced load of 500 watts on each phase.
$E_aI_a \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase A
$E_aI_b \cos\theta = 100 \times 4.545 \times 0.5 = 227$ watts plus
$E_cI_b \cos\theta = 100 \times 4.545 \times 0.5 = 227$ watts in phase B
$E_cI_c \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,454 watts; meter 3.07 per cent slow.

Fig. 3—Voltages on phases A and C, 110 volts; phase B, 100 volts; balanced load of 500 watts on each phase.
$E_aI_a \cos\theta = 110 \times 4.545 \times 1 = 500$ watts in phase A
$E_aI_b \cos\theta = 110 \times 5 \times 0.5 = 275$ watts plus
$E_cI_b \cos\theta = 110 \times 5 \times 0.5 = 275$ watts in phase B
$E_cI_c \cos\theta = 110 \times 4.545 \times 1 = 500$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,550 watts; meter 3.33 per cent fast.

Fig. 4—Voltages on phases A and B, 100 volts; phase C, 110 volts; balanced load of 500 watts on each phase.
$E_aI_a \cos\theta = 100 \times 5 \times 1 = 500$ watts in phase A
$E_aI_b \cos\theta = 100 \times 5 \times 0.5 = 250$ watts plus
$E_cI_b \cos\theta = 110 \times 5 \times 0.5 = 275$ watts in phase B
$E_cI_c \cos\theta = 110 \times 4.545 \times 1 = 500$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,525 watts; meter 1.67 per cent fast.

Fig. 5—Voltages on phases A, B and C, 100 volts; 400 watts on phases A and C, 700 watts on phase B.
$E_aI_a \cos\theta = 100 \times 4 \times 1 = 400$ watts in phase A
$E_aI_b \cos\theta = 100 \times 7 \times 0.5 = 350$ watts plus
$E_cI_b \cos\theta = 100 \times 7 \times 0.5 = 350$ watts in phase B
$E_cI_c \cos\theta = 100 \times 4 \times 1 = 400$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,500 watts; meter correct.

Fig. 6—Voltages on phases A and C, 110 volts; phase B, 100 volts; 400 watts on phases A and C, 700 watts on phase B.
$E_aI_a \cos\theta = 110 \times 3.64 \times 1 = 400$ watts in phase A
$E_aI_b \cos\theta = 110 \times 7 \times 0.5 = 385$ watts plus
$E_cI_b \cos\theta = 110 \times 7 \times 0.5 = 385$ watts in phase B
$E_cI_c \cos\theta = 110 \times 3.64 \times 1 = 400$ watts in phase C
Energy consumed, 1,500 watts; energy registered, 1,570 watts; meter 4.67 per cent fast.

Fig. 7—Voltages on phases A, B and C, 100 volts; balanced load of 500 watts on each phase.

$E_aI_1 \cos\theta = 110 \times 9.366 \times 0.7604 = 785$ watts on element 1
$E_aI_2 \cos\theta = 110 \times 9.366 \times 0.7604 = 785$ watts on element 2
Energy consumed, 1,500 watts; energy registered, 1,570 watts; meter 4.67 per cent fast.

recording maximum demand. The split-coil meter and the two-element meter with three current transformers the secondaries of which are connected in delta are inaccurate on unbalanced voltage and connections are not easily made or checked. The delta connection requires oversize transformers or 10-amp. meter coils, and the split-coil meter is hard to calibrate and parts are not interchangeable. The three-element meter is accurate under all conditions of load and voltage, is suitable for demand recording and the total registration is recorded on one dial. The connections are also easily made. The disadvantages of higher first cost and possibly of the fact that the moving element is heavier, causing greater wear on the jewel, are offset by the fact that the method is accurate under all conditions which have been studied in this investigation.

# Power Requirements of Machinery Used in Cotton Mills

Trends in motor drive practice. Average data on typical applications. Plant load distribution analysis offered in connection with estimate basis

By H. H. Bodge

*Power Engineer Fall River (Mass.) Electric Light Company*

SINCE 1894, when the pioneer textile electric drive was installed in the shape of seventeen 65-hp. induction motors at the Columbia Mills, in Columbia, S. C., the growth of electric service in textile mills has increased to a point where more than two-thirds of the 3,000,000 hp. required to run these establishments in this country is furnished by motors. In outlining the trends in motor application it may be helpful to touch briefly upon the present process routine involved in cotton mills.

Purchased cotton arrives in 450- to 600-lb. bales measuring about 30x40x58 in. The first process requiring power is the opener. Cotton is fed from the bale or from the mixing floor to the feed box, where it passes through a beating process, which loosens the compressed fibers and beats out some of the motes and dust. After beating it passes by suction through a pipe or conductor to the next machine. Openers are best operated by individual drive, the motor mounted on the machine and belted directly to the drive pulley. The average type of opener requires 3 hp. preferably ventilated by ducts directly from outside air.

The next process, lapping, further cleans and loosens the fibers and forms them into laps or rolls. Usually there are three lapping machines—the breaker, the intermediate and the finisher. All three continue to clean the cotton. During the last few years single machines have been introduced that accomplish the required beating in one operation or handling and in general effect a combination of the three processes previously used. Such an outfit requires 20 hp. to operate. All types of lappers are best driven with individual motors. The elimination of overhead belting and shafting in the picker room is very desirable, owing to the large amount of lint and dust that collects everywhere. The fire hazard is large and warrants extra precautions and expense to avoid the possibility of fire from overheated motors or improper wiring.

The laps are carried next to the cards, where the cotton is fed over a revolving cylinder covered with what is known as card clothing. This clothing is made of cloth or rubber having wire teeth of about No. 34 gage inserted in it which stand 200 to 600 per square inch. Through this the cotton is passed. The combing action of the process further cleans and lays the fibers more or less parallel to one another. From this cylinder the combed cotton is removed in the form of a sheet, drawn through a trumpet and formed into a round mass called sliver. This is coiled in a can for handling.

A card is a delicately adjusted machine and great care must be taken not to overload it. The average production is about 150 to 175 lb. per day, or approximately one lap every two hours. Sliver cans hold from 7 to 8 lb. each and run full in about twenty minutes. Cards require very little power, the custom being to drive them in groups of twenty to twenty-five. When laying out a card room, 1 hp. per card is found to be about right. Some of the more recent installations in the South have used individual drive, the motor being geared directly to the drive shaft. This method is ideal but expensive.

Cotton is valued by its length of staple. Commercially graded cotton known as 1¼ staple will have mixed in it all lengths of fiber from ¼ in. to 1½ in. The next process, combing, sorts out and rejects all (or any desired per centage of) fiber below 1¼ or below any other specified length. This treatment conduces to much evener and smoother yarn. Of late years combers have been introduced to handle much shorter fibers than previously and are coming more and more into use.

Before cotton is passed through the comber, however, two preparatory processes form the card sliver into narrow laps or cheeses from 8 to 14 in. in width. The first is called a sliver lap machine, which takes the card sliver from twelve to twenty cans and spreads them out into the shape of a lap. The second is called a ribbon lapper. Usually six sliver laps are fed into this machine, where it is drawn out to the weight of a single sliver lap. The lap delivered by this process is much evener and smoother than that delivered by the sliver lapper.

From the ribbon lapper this lap is fed to the comber, which sorts out and rejects the short fibers. The comber delivers its product in the form of a sliver similar to the card sliver. Combers require ½ to ¾ hp., depending upon whether they are six or eight head machines, and are driven in groups. The silver lapper requires 1 hp. and the ribbon lapper ½ hp. They are usually driven in the same group with the combers.

---

*From a paper before the New England Association of Central Station Power Engineers.

When the sliver leaves the comber, the fibers have been laid approximately parallel and are of uniform length, but owing to their natural tendency to curl and twist, they stand out in many directions. It is the purpose of the next process, drawing, to stretch some of this curl out of the fibers and to finish the process of parallelizing. Six cans of comber silver are fed together between rolls and drawn into one sliver. This constitutes one delivery of drawing. Each machine usually has six deliveries and requires 1 hp. to drive. Group drive is generally used for this process.

The several operations up to this point have been devoted to cleaning and parallelizing the fibers. In the next process, slubbing, twist is introduced and the product is wound on bobbins.

From the slubber these bobbins are passed to the roving frames, where the stock is further drawn out and twisted. There are generally three processes: slubbing, intermediate roving and fine roving. The work done in all of these processes is exactly the same. Each successive machine delivers finer (or lighter) stock than it receives. Four-frame drive is highly recommended for this process. In slubbing, 45 to 60 spindles operate on 1 hp. in intermediate roving, 55 to 65 spindles per horsepower and in fine roving from 80 to 100 spindles per horsepower. The variation is due to the various spindle speeds used. The faster the spindle speed the fewer the spindles that can be operated with 1 hp.

The final process in making yarn is spinning, which consists of further drawing out and imparting the final twist to the product. There are two ways in which spinning is accomplished—mule spinning and ring spinning. Mule spinning is the older system and is used almost universally in England. In the United States, however, ring spinning has supplanted the old method except for very fine yarns.

Several methods are in use for driving spinning frames —individual drive, four-frame drive and group drive. Individual drive, well installed, is without question the best that can be obtained, but it is expensive. Four-frame drive is very popular and is easily installed, 20-hp. double-end motors designed for the purpose being available. This makes a neat and flexible installation and has proved satisfactory in every way. Group drive is the least desirable, although the low investment cost makes it attractive when ample funds are not available. Groups requiring 100 hp. are installed in many mills, and although they are somewhat better than the steam drive, they tend to defeat the real advantages of motor drive. Groups requiring not more than 50 hp. give good results but lack the flexibility of the four-frame method.

The power required per spindle to operate spinning frames varies widely, depending on the speed of the spindle, the size of the yarn and whether the yarn spun is intended for warp or filling. The accompanying table gives the power required under various conditions. Sixty spindles per horsepower is a safe average.

Two kinds of yarn are spun in a cotton mill—warp yarn and filling yarn. The filling yarn passes directly from the spinning frames to the weave room. The warp yarn, however, requires the following processes: spooling, warping, slashing or sizing and drawing-in.

The object of spooling is to take yarn from bobbins, on which it has been spun and wound with irregular tension, and rewind it regularly on spools. These spools hold from ten to fifteen bobbins. Spoolers usually have about 250 spindles and are group driven. Each 250 spindles require 1 hp.

Warpers and spoolers are usually in the same room and all are driven by one motor. This is not objectionable when the total load does not exceed 35 to 40 hp. The full spools are next mounted on a reel, or frames holding from 300 to 600 spools, which are unwound and the strands laid evenly on a beam or large spool holding 24,000 yd. and weighing approximately 430 lb. The number of ends wound on the beam is determined by the character and width of the cloth to be woven. Warpers require about 1 hp. each and are group driven.

Slashing, or sizing, is the next process. Warper beams are unwound and the yarn is passed through a hot size bath made principally of starch, after which it is run over a steam-heated drum and dried. It is then wound again on a beam and is ready for weaving.

Warp beams are placed on a frame with the loom harness suspended in front. There are two or more harnesses according to the character of the cloth woven. If two harnesses are used, one end of the warp is drawn through an eye in one harness and the next end through an adjacent eye in the other harness. With more harnesses, the warp may be drawn in various ways according to the design of cloth. Three to four looms operate with 1 hp. and are driven in groups requiring not more than 50 hp. each.

There is a growing tendency toward individual drive weaving, and this is unquestionably superior from a manufacturing standpoint. The investment, however, is high and I question whether the slight increase in production offsets the high fixed charges of such an installation.*

Since the World War the textile industry, especially in New England, has found itself confronted with keen Southern competition. High taxes, labor costs, obsolete machinery and worn-out power plants are largely responsible for the present Northern textile depression.

Many steam-driven mills would gladly turn to purchased power if finances allowed, realizing the advantages and low power costs derived from such a move. Under present conditions, however, ideal installations are difficult. Mill superintendents and treasurers are today carefully analyzing costs which a few years ago were considered trivial and are figuring in mills instead of cents as previously.

Old plants seldom electrify as a whole but install a motor here or there as required until it is found no longer profitable to continue running the engine. The general practice has been to split up the existing line shafts into groups and install the proper sized motor. This method is cheapest, and although far from perfect, is a vast improvement over the old drive.

The average cotton mill driven electrically has a load distribution as follows: Openers, waste machines and pickers, 4 per cent; carding, 6 per cent; drawing, combers and speeders, 22 per cent; spinning, 33 per cent; spooling and warping, 5 per cent; slashing, 1 per cent; weaving, 15 per cent; machine shop, 0.5 per cent; lighting load, 4 per cent; miscellaneous power, fire pump, elevators, etc., 9.5 per cent.

An over-all estimate of the horsepower required to operate a mill can be safely based upon 0.032 hp. per spindle—that is to say, a mill of 100,000 spindles would require 3,200 hp. plus about 20 per cent for being overmotored, or about 3,800 hp. in motors installed.

---

**The use of individual motor drives for looms is making striking headway, ½ hp. per loom being widely applied up to 42-in. and ¾ hp. on larger units, rising to 5 to 10 hp. on duck looms.*—EDITORS.

# Load Distribution Between Parallel Lines

BY EARL BAUGHN
Engineering Department, The Washington Water Power Company,
Spokane, Wash.

FREQUENTLY it is desirable to know the distribution of power between two or more proposed dissimilar transmission lines in parallel under varying conditions of load or the effect of adding another line to an existing network. When calculated analytically, the equations become quite cumbersome and involved if more than two parallel lines are assumed. A simple graphical method based on the Perrine-Baum line regulation diagram has been used by the writer to solve both simple parallel lines and also quite complicated networks. Results for different assumed load conditions are quickly and easily determined.

The line regulation diagram as first proposed by Perrine and Baum, either in its simple form based on the resistance, reactance and capacitance of the line or the more accurate diagram based on the A, B, and C auxiliary constants of the line, is used by the author. However, any similar regulation diagram in which the receiving-end voltage is the vector of reference and the sending-end voltage vector is allowed to vary in phase displacement and amount may be used.

### PARALLEL TRANSMISSION LINES

When two or more transmission lines are operated in parallel, there are three things common to all—namely, the sending-end voltage, the receiving-end voltage and the angular displacement between the sending-end and receiving-end voltages. Reference to Fig. 1 shows that the voltage regulation diagram gives the delivered kilowatts and power factor of a line for any sending-end voltage and angular displacement for an assumed constant receiver voltage. Therefore, to solve for the kilowatts transmitted and the power factor of parallel lines, it is necessary only to make line regulation diagrams for each line for the same receiver voltage, and by assuming the same sending-end voltage and angular displacement between sending and receiver voltages for the different lines, the division of power is immediately determined.

In order that results may be had much more accurately and quickly, the charts for the lines concerned are made on tracing cloth with the same volts per inch scale so that they may be placed one upon the other with the receiver voltages in coincidence. Then for any chosen point on a sending end voltage circle the power and power factor on each line may be read from the charts. Also since we are concerned only with the kilowatt part of the dia-

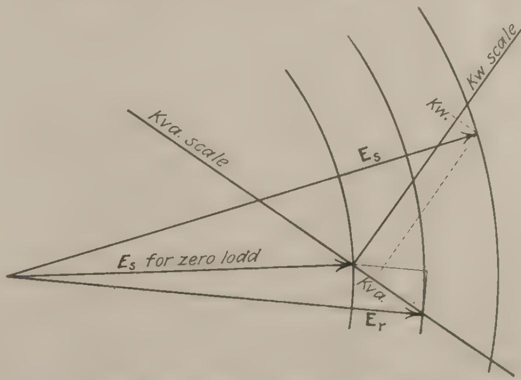

FIG. 1—LINE-REGULATION DIAGRAM (PERRINE-BAUM)
Diagram gives delivered kilowatts and power factor of a line for any sending-end voltage and angular displacement for an assumed constant receiver voltage.

gram, the chart is usually constructed as shown in Fig. 2, the receiver voltage vector being represented only by its tip end and the chart turned in such a way that the kilowatt scale is vertical.

If one line is of different voltage than the other and has transformers at each end, the chart for that line must include the constants of the transformers added to those of the line. The constants of the line must also be reduced to the constants of an equivalent line referred to the voltage of the receiving bus.

The general method described may be extended to the solution of extended and complicated networks. For instance, assume the network represented in Fig. 3. To solve this network charts should be made to the same volts per inch scale for the lines numbered 1 to 5. Then for any assumed amounts of power generated at *A* and at *B*, and loads at *C* and *D*, the distribution of power in the lines may be obtained by placing charts one upon the other, always remembering that the receiving-end volts for lines 2, 3 and 5 must coincide, that sending-end volts for the lines 1, 3 and 4 must also coincide, and that receiver voltage of line 1 is the same in phase and amount as the sending-end voltage of line 2, or vice versa, depending on the assumptions as to sending and receiver ends when the charts were made. The same is true of lines 4 and 5—that is, the angular displacement between the voltages at *A* and *B* and over line 1 plus the displacement between the voltages at *B* and *C* over line 2 equals the displacement between the voltages *A* and *C* over line 3.

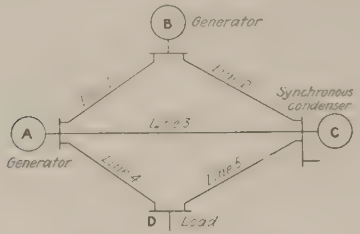

FIG. 3—TRANSMISSION NETWORK ASSUMED TO SHOW APPLICATION OF GRAPHICAL SOLUTION

Charts similar to those of Fig. 2 are made for each of the five lines and the same method of solution followed.

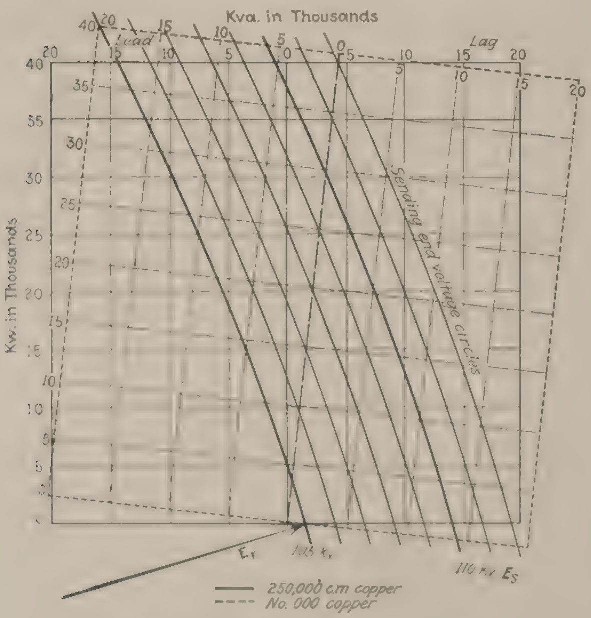

FIG. 2—REGULATION DIAGRAMS OF TWO PARALLEL TRANSMISSION LINES

Charts for the two lines are made to same scale on tracing cloth so that one may be placed upon the other with receiver voltages in coincidence. For any point on a receiver voltage circle the power and power factor on each line may be read from the charts. The charts are for two lines each 50 miles long, one of No. 3/0 copper in dashed lines, the other of 250,000-circ. mil copper in full lines. Receiver voltage is assumed to be 105,000 volts.

In solving a network it is usually permissible to disregard the transmission line losses, as they are rather difficult to include when reading the charts and results are not influenced a great deal by the losses. Accuracy of results by this method depends entirely on the care used in making the charts and in adjusting the position of one chart upon another before readings are made.

# Turbo-Unit Added for $16 Per Kva.

IN THE 1925 extension of the South Street station of the Narragansett Electric Lighting Company, Providence, R. I., a 43,750-kva. steam turbo-generator unit was added at a cost, including condenser, air-cooler equipment and minor auxiliaries, of $687,750. These costs were itemized in an appraisal by Jackson & Moreland, engineers, Boston, on behalf of the New England Power Association in connection with recent proceedings before the Rhode Island Public Utilities Commission, and are presented herewith as based on the company's detailed field outlay.

The turbo-generator consists of a 35,000-kw. (80 per cent power-factor) General Electric unit designed for 1,800 r.p.m., 350 pounds steam pressure and 200 deg. F. superheat, with provision for steam extraction at the eighth, twelfth and fourteenth stages, the generator being of 4-pole, type ATB design and wound for 11,000 volts. A 175-kw., 250-volt, compound-wound 6-pole exciter is also included. The condenser is of the Elliott-Ehrhart twin type, having two centrifugal extraction pumps each driven by a 250-hp., 2,300-volt, three-phase Westinghouse induction motor. The installation also embraces a surface-type air cooler, built in five sections, using fresh water at 90 deg. F., with a rating of 600 gal. per min. at 80 deg. F. and a unit output of 43,800 kva.

ITEMIZED INSTALLATION COST OF 43,750-KVA. UNIT

| | |
|---|---|
| Turbine, generator and exciter | $499,572 |
| Jet condenser and auxiliaries | 45,368 |
| Air cooler equipment | 36,203 |
| Lubricating oil system, including one No. 55 Sharples motor-driven purifier and one No. 600 Toval purifier with motor and piping | 10,590 |
| Also, one No. 122 Andale oil cooler, type 201F | 3,918 |
| Carbon dioxide fire extinguisher outfit, allocated portion of cost assigned to above generator | 5,976 |
| Fire extinguisher water and steam lines | 2,634 |
| Instrument piping for turbine and auxiliaries | 428 |
| Foundation for unit | 8,944 |
| Preliminary operation | 5,364 |
| Contractor's compensation, 5 per cent | 30,950 |
| | $649,947 |
| Condensing water piping from intake tunnel to condenser and thence to discharge tunnel, of 30-in. cast-iron, special fittings | 19,178 |
| Contractor's compensation, 5 per cent | 959 |
| Instruments | 13,835 |
| Spare parts | 2,990 |
| Contractor's compensation, 5 per cent | 841 |
| Total | $687,750 |
| or per Kva. | $15.72 |

# Tracing Radio Interference

### Details of routine method of locating various kinds of trouble. Test set proves value of audio-radio selective hook-up

By James H. Hanly

Radioman Blackstone Valley Gas & Electric Company, Pawtucket, R. I.

IN ANSWERING a radio interference complaint, it is necessary to hear the noise as reproduced by the customer's receiver. If the difficulty is not within the set itself, the troubleman should then start the test set in his car, tune it to the disturbing signal and explore the district as shown in the accompanying diagram. By using such a route the section where the noise is the loudest may be noted. A set which may be used for either radio- or audio-frequency amplification should be employed. Ordinarily the tuning of the set should be done at radio frequency, using the detector rheostat for audibility control. When the point of maximum sound intensity has been reached, the double-throw switch should be placed in the audio position on the set and, by patroling the locality, a point where the alternating-current audio tone becomes distorted can be found. This is the location of the trouble or noise.

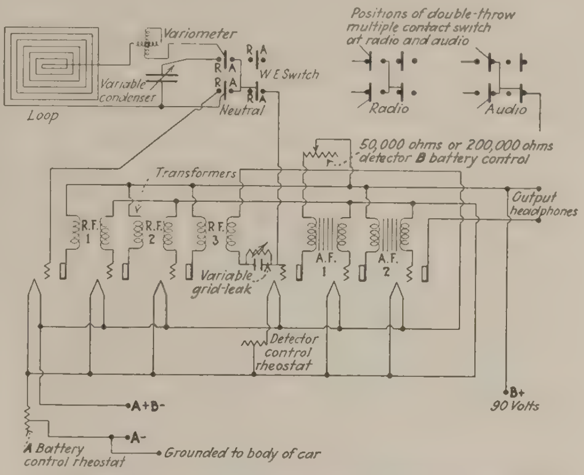
This method of testing can be used on high-tension systems up to 22,000 volts. On systems over 22,000 volts the audio test is not practical, as the electrostatic field is so intense that any radio-frequency components of the trouble are drowned out by the audio-frequency tone. Another reason is that, in most cases, the circuits of very high-voltage systems are placed too high for the loop to enter the field of the radio-frequency component. To lower the filament current of the tubes to a point where the tone may be heard without discomfort lowers the sensitivity of the pick-up and the trouble could never be found. The most successful method of locating trouble on voltages higher than 22,000 volts involves the use of the radio circuit with the audibility control.

When testing at audio frequency the troubleman must become familiar with the various noises so that he will not be confused by those not involved in the trouble. Under a street-railway wire the pick-up of the driving motors can be heard. Although this has been found at times to cause interference, it should be disregarded, due to the fact that although the set is in the field of the trolley, the street car may be miles away. This form of trouble must be found at radio frequency in order to constitute a source of interference. Another misleading noise heard at audio frequency is a "tick-tick" while under a telephone cable or telegraph line. This noise must be disregarded, as it is never heard at radio.

Whenever a case of trouble is believed to come from the street-light circuits, the same method of locating trouble can be used very successfully, but the most effective method is to test every lamp on the circuit. In doing so the troubleman can find all of the cases of radio interference on that circuit. A patrol of the circuit will also eliminate the possibility of its becoming open due to defective street-light fixtures. For this work the audio side of the set must be used at all times.

The most frequent causes of interference from power companies' systems are high-tension insulators, lightning arresters, primaries and arc wires in trees, 2,300-volt insulators, loose plug in primary cutout, and loose or defective street-light fixtures.

The troubleman must be familiar with the various characteristics of every type of wireless receiving set if the weak spots or possible causes of noise in the apparatus are to be located. Loose connections, defective grid leaks, condenser plates touching, low voltage on B batteries, diaphragm too close to magnets in speaker, and defective tubes are among the many causes of noise in a set.

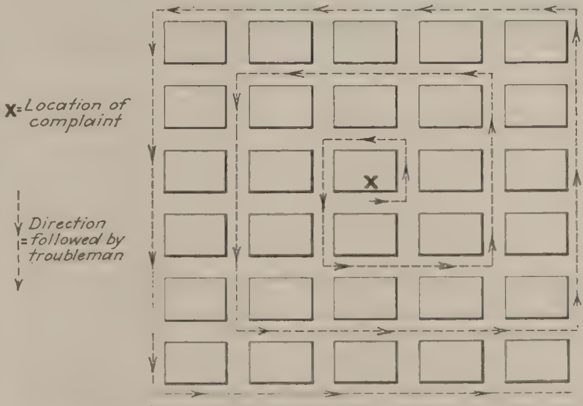


WIRING DIAGRAM OF RADIO-AUDIO RECEIVING SET

### Type of Test Set Recommended

The present supersensitive radio receivers require equally sensitive test sets for locating radio interference. Such a set should have two important features. It must be sensitive enough to receive at radio frequency the interference heard by the customer and it must also be able to show the exact location of the trouble. This second feature requires a less sensitive instrument, because a very sensitive test set will frequently pick up the noise with equal intensity over a wide area.

To overcome this disadvantage, the audio-frequency test set was developed. In using the audio testing can be done in the electrostatic field, the set relying on the position of the loop in that field for the amount of pick-up.



GENERAL PLAN OF ROUTE FOLLOWED BY RADIO COMPLAINT MAN

The test set used by the Blackstone Valley Gas & Electric Company for more than a year with excellent results has six tubes—that is, three radio, one detector and two audio. The radio-frequency tubes are coupled by frequency transformers of the untuned type. This method of coupling makes only the one tuning condenser used to tune the loop necessary. The detector tube circuit is similar to the ordinary set except that a variable grid leak is used which is located on the operating panel.

To change from radio to audio operation a switch is used which at radio connects the condenser across the loop and also connects one side of the loop to the negative of the A battery and ground and the other side of the loop to the grid of the first radio-frequency tube. At audio the loop is short circuited and connected directly to the grid of the detector tube. The total weight of the set complete with batteries is about 20 lb.

## Porcelain Duct Entrances Reduce Cable Sheath Troubles

By William Beauregard* and O. G. Brush†

CABLE sheath troubles have been reduced 90 per cent on the system of the Fall River (Mass.) Electric Light Company by the use of a new design of duct entrance for manhole service. The objective was the elimination of the wear of cables at duct edges, and the experience is based on eight months' service. The equipment consists of porcelain duct bells precast into a concrete block with rounded edges, thus permitting a maximum bend in the cable without fear of sharp corners. Prior to preceasting, the bells are mounted on an adjustable steel form. A fiber collar is cut in half, the cut edge being fastened on the porcelain with a beveled edge upward. This allows the fiber conduit to fit exactly and makes a smooth joint.

FINISHED MANHOLE USING PRECAST DUCT ENTRANCES

In making the mold for the precast block, the form is laid on a wooden base or floor, the sides are boarded up and a 1 to 2 mixture of concrete is poured around the porcelains. After about 48 hours' setting, the form is removed and the precasting is ready for installation. Any desired combination of precast entrances can be made and the bells are designed to fit any size conduit. When installing in a concrete manhole, the precast entrance is mounted at duct elevation and the concrete is poured around. In brick manholes, when the bricklayer arrives at duct level, the precast entrance is mounted and the brick is placed around it. This construction has been found especially useful where springs or water are encountered. The cost is only about 1 per cent of the cost of the manhole on concrete work, and the precasting is usually done on rainy days and in spare time under cover. In the case of brick manholes, it has been found cheaper to install a precast entrance, including the cost of the material, than to brick around the duct entrance.

DUCT BELLS MOUNTED ON ADJUSTABLE FORM AND BOXED IN PREPARATORY TO PRECASTING BLOCK

## Welded Buildings Economical, but Experience Essential

"TWO classes of cost savings are secured in welded construction," declared Gilbert D. Fish, consulting structural engineer of the Westinghouse Electric and Manufacturing Company, before the Affiliated Technical Societies of Boston, recently. "There is a reduction in the tonnage of steel required, and there is a saving per ton in the cost of the steel handled. Tonnage is saved by the use of lighter members and the elimination of much connecting material. For example, the five-story arc-welded building at Sharon, Pa., contains 12 per cent less steel than would a similar riveted building. In a welded railroad bridge now under construction at Chicopee Falls, Mass., the amount of steel being used is 33 per cent less than that needed for riveted construction.

"Savings in the cost of handling are due to the fact that a very large proportion of the punching, fabrication and detailing essential for riveting is not needed with arc welding. In an arc-welded building erected at Derry, Pa., 60 per cent of the steel was not fabricated, and the cost of the structure was 12 per cent below its cost if riveted.

"It is expected that welded bridges of the future will prove somewhat more permanent than riveted ones, because the immovability of the joints removes the chief cause of fatigue. Although weld metal is less ductile than rivet steel, a properly designed and executed welded joint should have greater endurance under stress reversals than a good riveted one, because in the case of the latter the connection members and rivets are subject to slight motions back and forth, frequently beyond the elastic limit. Another factor favoring long life for welded joints is their smoothness and absence of rivet heads, with corresponding ease of painting and lessened tendency to corrode.

"Now that arc welding is widely regarded as a coming method which may presently cause extensive changes in structural practice, it is time to sound a warning against its hasty or ill-considered adoption by those to whom it looks too easy. The opposition that has been faced all along the line by those who have built pioneer structures by welding has forced careful consideration of every step, has called for proof of the safety of every detail and has brought about inspection of more than ordinary thoroughness. With the recent noticeable relaxation of opposition to welded construction, with the rapid awakening of interest among steel fabricators, engineers and architects and with the rising demand by the public that the clamor of the pneumatic rivets be stopped, there approaches the day when bad engineering or bad welding may cause something to give way.

"There is nothing dangerous about welding if proper control is exercised; the only danger is that which is inherent in any new method—the lack of experience on the part of those using it. The steps necessary to insure control are correct engineering, schooling of welding operators and inspection by men trained in that work."

# Cooking Schools Prove Value by Increased Sales

By Edward Horry

Vice-President and General Manager Edison Sault Electric Co., Sault Ste Marie, Mich.

THE COOKING school demonstration has been found to be an effective agency to promote the sale of electric ranges. For two years the Edison Sault Electric Company has utilized such demonstrations, usually in the spring, and in these two years it has sold more ranges than in any previous six years. The total number of residence accounts is 2,669. Gas competition is strong. A four-day cooking school last spring brought out an attendance of 557 and six ranges and twelve refrigerators were sold in the three weeks following the school. The sales were made by people coming in and buying, not by high-pressure methods. The refrigerator sales were a by-product of the school.

The school was held in a garage adjoining the power company office, and the entrance was arranged so that attendants passed through the company sales room. The garage was cleaned up and decorated, chairs rented, a platform built and the kitchen set up. The electric refrigerator was placed close to the range, kitchen cabinet and work table, so there was little lost motion. Preparing and cooking the food were demonstrated and explained. Various schemes may be used for creating interest. In the last school there was a cake-baking contest, with 46 entrants, a worth-while prize being offered to the winner.

The cost of the 1927 school, except for the demonstration platform, which is available for many other uses, and the cost of cleaning the garage, which is charged only partly to the school because the place needed cleaning anyhow, was $197, including $64.65 for newspaper advertising, $21.61 for cooking and baking supplies, $20.18 for prizes, $17.29 for materials for decorating, $25.39 for labor and $20 for rental of chairs.

It is not possible to assign a figure of total range sales attributable to the cooking school. Its effect is cumulative over a period of years and there is no way of telling whether sales made in December are the results of a demonstration in April or not. However, the management of the Sault company is convinced of the value of these efforts and will continue them. It believes that the independent central station in the small town can accomplish, commercially, as much in proportion as does the larger system.

The Edison Sault Electric Company is perfectly willing to open its files to utilities interested in this subject, if more detailed information is desired.

# 600 Lumens Per Foot Used on Oakland's "White Way"

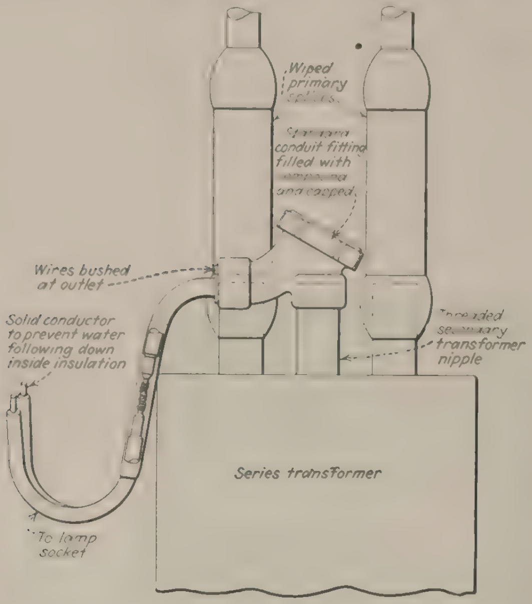
EMBARKING upon a comprehensive program for the modernization of its street lighting, Oakland, Calif., recently placed in operation more than 3 miles of white-way lighting in its central business district. Two-light standards numbering 353, of typical Oakland design, are spaced approximately 100 ft. apart, located in opposition on both sides of the street, and are equipped with two 15,000-lumen lamps. The contrast between the new lighting, which gives 600 lumens per linear foot of street, and the old obsolete system is strikingly shown in the illustration.

NIGHT VIEW OF OAKLAND'S NEW LIGHTING SYSTEM AND STANDARD POST ADOPTED

Three post designs that permit competitive bidding have been adopted by Oakland, Calif. The use of these designs has been made compulsory in the interest of uniformity.

The new lighting system was installed under provisions of the California state municipal improvement act of 1911 by which the cost of the improvement is assessed against the property owners. The cost of the present lighting system to the property owners was $4.63 per front foot. In addition to the capital cost of the system the property owners pay a part of the energy and maintenance cost. The proportion of this expense that the property owners bear was determined by figuring what the maintenance would be on a lighting system that would be adequate for public safety and convenience and assessing the property owners for the difference between this and the cost of maintaining the ornamental system installed. The base upon which the city figured its proportion of maintenance was a single-light standard with one 6,000-lumen lamp giving 120 lumens per linear foot of street.

The installation is of interesting design. To avoid the trouble experienced in the past with water following down the low-voltage leads in the post and getting into the transformers in the base of the posts, City Electrical Superintendent C. E. Hardy specified that the low-voltage leads be taken out from the transformers through a compound-filled conduit fitting. The details of this construction are shown in the accompanying diagram.



Wiped primary splices
Standard conduit fitting filled with compound and capped
Wires bushed at outlet
Solid conductor to prevent water following down inside insulation
Threaded secondary transformer nipple
Series transformer
To lamp socket

COMPOUND-FILLED CONDUIT USED TO PREVENT THE ENTRANCE OF WATER INTO SERIES STREET-LIGHTING TRANSFORMER

# Ornamental Street Lighting Construction Costs

THE accompanying tabulation shows the unit and extended prices, less lamps, of the new ornamental street-lighting system at Elmhurst, Ill. Elmhurst is a town of about 12,000 population in the Chicago metropolitan district. The installation includes 893 single-lantern concrete standards; 2,500-lumen and some 1,000-lumen lamps are used.

COST OF ORNAMENTAL STREET LIGHTING AT ELMHURST, ILL.

| Classification | Unit Price | Extension |
|---|---|---|
| 283,000 ft. of trenching, 4 ft. x 10 in., and backfilling | $0.04 | $11,320.00 |
| 9,900 ft. of 2½-in. wrought galvanized iron pipe under street crossings | 0.98 | 9,702.00 |
| 1,300 ft. of 2½-in. wrought galvanized iron pipe under railroad crossings | 1.00 | 1,300.00 |
| Twelve brick masoury manholes installed complete | 145.00 | 1,740.00 |
| 107,000 ft. No. 8 5,000-volt parkway cable installed | 0.25 | 26,750.00 |
| 359,000 ft. No. 8 2,500-volt parkway cable installed | 0.15 | 53,850.00 |
| 893 reinforced concrete lighting standards installed complete | 38.00 | 33,934.00 |
| 893 solid bronse octagonal lanterns installed wired complete | 44.50 | 39,738.50 |
| 893 post holes 20-in. diameter 4 ft. deep complete | 0.90 | 803.70 |
| 47 4.2-kva. branch line constant-current 6.6 amp. subway-type transformers | 156.00 | 7,332.00 |
| One 4 P S T 400-amp. remote-control oil circuit Breaker installed complete | 420.00 | 420.00 |
| Six 2 P S T 400-amp. remote-control oil circuit breaker installed complete | 378.00 | 2,268.00 |
| Twelve 6,600-volt. S P combination disconnecting switch and fuse installed complete | 52.00 | 624.00 |
| One 3-kva. 2,300-230/115-volt 60-cycle | 62.50 | 62.50 |
| Six 34-kva. moving coil 6.6-amp. C S STA type regulators | 720.00 | 4,320.00 |
| One length 150 ft. 30-conductor No. 19 wire control cable installed complete | $195 00 | $195.00 |
| One slate panel 24x24x1½-in. drilled for watt-hour meter installed | 25.00 | 25.00 |
| Sixteen cells 400-amp.-hour storage battery, complete with knife switch installed complete | 26.00 | 416.00 |
| One 6-amp., 75-volt bulb-type rectifier installed complete | 180.00 | 180.00 |
| Three 4,000-volt low equivalent lightning arresters installed complete | 110.00 | 330.00 |
| One piece approximately 100 ft. of No. 2 lead-covered four-conductor, 4,000-volt service cable | 285.00 | 285.00 |
| One pipe frame switchboard complete with busbars, insulators, etc. | 500.00 | 500.00 |
| Twelve two-wire, 4,000-volt disconnecting potheads installed complete | 22.00 | 264.00 |
| Six two-wire, 4,000-volt non-disconnecting potheads installed complete | 18.00 | 108.00 |
| One four-wire disconnecting pothead installed complete | 38.00 | 38.00 |
| One four-wire non-disconnecting pothead installed complete | 25.00 | 25.00 |
| One concrete cable vault installed in substation | 124.00 | 124.00 |
| 60 ft. of 3-in. iron conduit laid in floor of substation as specified | 1.50 | 90.00 |
| 250 ft. of 2½-in. iron conduit laid in floor of substation as specified | 1.00 | 250.00 |
| 110 ft. of 4-in. fiber conduit laid in concrete as specified | 1.75 | 192.50 |
| One set portable testing instruments as specified complete | 510.00 | 510.00 |
| One transformer substation building completely erected | 3,675.00 | 3,675.00 |
| Total | | $201,372.00 |

# Boiler Plant Equipment Costs

FROM the cost sheets of an eastern power company are taken the following cost data applying to various boiler plant equipment installed about two years ago in a tidewater station extension under excellent engineering supervision. Four boilers with a combined rating of 7,168 hp. were installed with pulverized coal burners, a new stack, and other apparatus. In using these items in checking other work, they should be applied in segregated form, as indicated, and not totaled to obtain the over-all cost of a complete installation. As itemized, the costs given represent outlays actually made with the equipment installed.

MISCELLANEOUS BOILER PLANT COSTS
EQUIPMENT INSTALLED 1925

| | |
|---|---|
| 2—1876-hp. B. & W. cross drum water tube boilers, 385 lb. steam pressure, 18,755 sq.ft. heating surface each; tubes 20 high, 36 wide, 4-in. tube diameter and 10-in. steam outlet | |
| 2—1,708-hp. similar boilers, tubes 18 high and 36 wide; 17,084 sq.ft. heating surface per boiler | |
| 4—B. & W. superheaters, each 120,000 lb. steam per hour to 200 deg. F. above saturated steam temperature at 375 lb. | |
| Water screens for powdered fuel furnace tubes 4 in. diam., 14 in center to center, 430 sq.ft. bottom; 599 sq.ft. side walls, 468 sq.ft. rear wall | $325,691 |
| 1—Extra boiler drum, 36 in. x 26 ft. 10.5 in., with equipment for testing, 400 lb. | 7,551 |
| Settings for above four boilers, including 9-in. fire brick lining furnace bottom walls and filling top ash gates, rear, side and front walls fire brick and Sil-O-Cel construction | 113,725 |
| Steel sheet boiler casings | 40,810 |
| Diamond soot blower equipment | 15,063 |
| Soot conveyors | 12,953 |
| 32—Lopulco pulverized coal burners, 8 per boiler | 3,975 |
| Contractor's compensation on above items | 25,988 |
| 4—Air preheaters, consisting of two 40,000 sq.ft. Ljungstrom regenerative type; one 15,000 sq.ft. B. & W. tube type, and one 14,000 sq.ft. Combustion Engineering plate type, and accessories to Ljungstrom type | 104,871 |
| 2—50,000 c.f.m. forced draft fans, Sturtevant No. 110, 5 turbovane, driven by 40-hp. variable-speed slip-ring motor, and | |
| 2—110,000 c.f.m. Sturtevant induced draft fans, 8-ft., one driven by 40-hp. motor and one by 200-hp. motor | 41,789 |
| Air ducts | 35,982 |
| Flues and uptakes | 17,884 |
| Combustion control system | 27,[illegible] |
| Steel stack and bonnet, 18 ft. 9.5 in. diameter, 220 ft. high above roof | 40,677 |
| Radial brick lining in upper part of stack 4.5 in. | 7,055 |
| Pulverized coal piping, 700 ft. of 8-in. coal house to bins | 32,929 |
| Coal piping from weigh bins to bunkers (two 8-in.) | 12,650 |
| Weigh bins and testing apparatus | 7,006 |
| Coal pump for testing | 6,814 |
| 24—5.5-in. multiple type coal feeders, 50-hp. motor each and four 7,500 c.f.m. blowers, 12-hp. motor each | 4,302 |
| Coal piping for testing | 3,985 |

# Financing for Service

*BOND and debenture financing in its various aspects was discussed in the Dec. 24 issue under the caption, "Financing for Service." The discussion is here continued, with special bearing upon stock financing and the importance of customer sales in public relations.*

THE history of the changes leading up to the preferred stock provisions now in almost general use by utility companies is similar in some respects to that of the evolution of the modern open mortgage. These changes have followed amendments to state corporation laws enacted from time to time as experience has dictated their necessity or advantage. While the amount of stock which may be issued is fixed by charter (subject to change by stockholders' vote), this is not a serious handicap, as stockholders' authorization of a warranted increase ordinarily can be obtained, though on occasion special effort may be necessary to obtain it. Preferred stocks usually are now issuable in series, with dividend rate and redemption price determined for each series as created, and ordinarily subject, with respect to issuance of additional stock of any series, to charter provisions prescribing a minimum margin of earnings over dividend requirements and sometimes specifying the relation of total preferred stock to value of assets or to total capitalization. These amplifications have materially facilitated the raising of capital through sales of stock with salutary effect on the disproportion between senior and junior securities formerly existent in the capital structures of many utility companies.

### Value of Customer Sales

Since customer-owner campaigns on an extensive scale were undertaken about thirteen years ago, great strides have been made by electric utilities in placing their preferred stocks among investors in the territories they serve. Aside from its effectiveness as a means of regularly procuring funds, this procedure has been advantageous in other important respects. It has aroused a growing interest in and better understanding of the problems of the utilities. Their long records of uninterrupted dividend payments have inspired confidence in their securities as investments, a significant supplement to the confidence in their intent and ability to serve economically and well. General adoption of plans requiring only small installment payments has encouraged small wage earners in increasing numbers to purchase preferred stocks and thereby regularly to save part of their earnings. Attracted by good investment returns, possessors of larger incomes have joined the rapidly growing ranks which now comprise 5,000,000 direct holders of public utility securities.

Not long ago almost any reference to preferred stock issues would have brought to the forefront the question of voting rights, then receiving much attention principally because of opinions expressed by one of the country's widely known economists with particular reference to certain industrial corporations. In the ensuing discussions various theories were advanced, many of them premised on circumstances foreign to preferred stocks of regulated public utilities. More than a year has passed, the air has cleared and now we find ourselves about where we were before a few isolated cases of roundly criticised industrial financing encouraged the many-sided arguments that for a time seemed to stir the world of finance. The supposition that a preferred stockholder is a partner in the business seems to be the principal reason for advocating that preferred stock be endowed with the full voting privilege.

"Preferred stock" implies, at least to most people, a stock having preference over some other stock. If the preferred stock is of the type which has been usual for so long that the mere mention of the term warrants the assumption that it is, it has prior call over the common stock on earnings for the purpose of paying its dividends, and on assets for the purpose of paying the par or otherwise stated amount in the event of dissolution.

### Not Partner in Ordinary Sense

The term "partner," used without qualification, implies proportionate sharing of profits and risks, a condition not at all applicable to the holder of a security who must receive the full amount of a stimpulated sum from earnings before any part of such earnings can be applied to the payment of dividends on the common stock, and who, in the event of the winding up of the business, must receive the full amount of a stipulated sum before any part of the proceeds of sale of the assets can be paid to the owners of the common stock erroneously spoken of as his "partners." And, incidentally, it is not unusual, in fact it is quite usual, to find that a so-called "non-voting" preferred stock has voting rights in certain events, such as default in dividend payments and on proposals to increase the authorized amount of preferred stock, create a security having prior rights or to mortgage or sell assets. The holder of such a preferred stock is not, or at least need not be, concernd with the details of management so long as the terms of the contract made with him are met, and particularly when the operations and issuance of securities of the issuing corporation are subject to commission jurisdiction and the corporation is controlled by those who have proved themselves worthy of the trust and able to discharge the attendant responsibilities and who have large actual investments in the common stock. Such a situation is vastly different from that of an unregulated industrial corporation, controlled through the medium of a nominal issue of so-called "management stock" or otherwise by interests that do not own or represent a large actual investment in the stock of the corporation.

Before leaving the subject of voting rights it may not be amiss briefly to comment upon the apparent indifference of stockholders. A review of the records of the voting at stockholders' meetings of large representative corporations over a period of years would probably disclose some highly interesting facts, if newspaper reports on their meetings are indicative of the attitude of the average stockholder. At annual meetings held principally for the election of directors, usually requiring only the vote of a majority of voting stock, often but little more than the essential majority is represented despite the fact that the stockholder is called upon merely to sign a printed proxy and mail it in an envelope already stamped and addressed. It has often been found necessary to organize campaigns and actively solicit proxies in order to obtain the minimum vote required by statute at meetings at which action is proposed to be taken on special matters of unquestioned advantage to the stockholders. In that connection it is interesting to note that an official of one of the large public utility holding companies was recently told by a stockholder that she would sell her stock if she was to be bothered by having to vote upon any matter. It can hardly be said that such indifference is indicative of dissatisfaction, as serious dissatisfaction if it existed would undoubtedly be evidenced in some manner, perhaps by sale of the stock, if not by direct communication with officials of the corporation.

The amounts of common stock issued by electric utilities in late years have, in the aggregate, represented a greater proportion of their total security issues than ever before, though the procedure has been, in general, somewhat different from that followed in their bond and preferred stock financing.

### METHODS OF DISTRIBUTION

Bonds usually are sold in blocks to investment bankers, who in turn distribute them to investors. Preferred stocks, when sold in customer-owner campaigns, as has been true in the majority of cases, are disposed of through the companies' own securities departments or regular employes in small lots day after day until the amount of the issue has been sold. On the other hand, it has been the practice among the majority of utility companies to make to their stockholders a single subscription offering of the total proposed issue of common stock, such offerings as a rule being made not more frequently than once a year. Many of the important electric utilities of the country are now either under holding company control or have holding or investment companies among their large common-stock holders, with the result that the holders of the preferred often greatly outnumber the holders of the common stock. The amounts of issues of additional common stock applicable to these large holdings usually are subscribed for in order that proportionate interests in the equities may be maintained. Thus, notwithstanding its importance as a means of obtaining capital, the common-stock financing of the electric utilities has come less before the general public than their bond and preferred stock issues, due to the more concentrated ownership.

In addition to the large investments made from time to time in their common stocks, well-managed electric utilities usually leave in surplus account a considerable portion of the earnings available for dividends on the common stock, such surplus being reinvested in the properties and business. Analyzed from any viewpoint, this policy is conservative and worthy of encouragement, though sometimes the common-stock holders are penalized, or attempts are made to penalize them, for such conservatism. Earnings which common-stock holders are legally entitled to receive as dividends but which the directors wisely elect to reinvest in the business and thereby strengthen the position of the corporation are entitled to earn reasonable returns, just as are the invested proceeds of securities issued to provide for capital requirements. When the reinvested earnings are not capitalized, the result is an increase in the rate of earnings on the common stock, assuming, of course, continuance of reasonable returns on the total investment.

Such situations at times have stimulated the ambitions of those seeking political preferment on any pretext, and encouraged claims of exorbitant charges for services, the accumulated surplus being pointed to as evidence of past excesses, and the high rate of current common-stock earnings as evidence of continuance of the alleged abuses.

As a matter of fact, earnings on the common stock of a utility corporation may reach a high rate while at the same time its entire earnings remain within the limits of reasonable returns. Let us take, as a hypothetical case, a corporation with $10,000,000 of property and $10,000,000 of capitalization consisting of, say, 60 per cent, or $6,000,000, of bonds; 20 per cent, or $2,000,000, of preferred stock, and 20 per cent, or $2,000,000, of common stock. With such a capital structure and a well-developed and growing business, sound rate schedules and policies of management, property in first-class operating condition and satisfactory public and employee relations, the corporation should be able, at least under market conditions similar to those now prevailing, to sell its bonds at a 5¼ per cent annual cost and its preferred stock at a 6¼ per cent annual cost. Earnings equal to the commonly recognized, though not always realized, return of 8 per cent on the $10,000,000 of property would amount to $800,000. After deducting annual interest and preferred dividend charges at 5¼ per cent and 6¼ per cent respectively, there would be available for the $2,000,000 of common stock $360,000, or 18 per cent. If two-thirds of such earnings, or 12 per cent, were paid as dividends on the common stock, $120,000 would remain in surplus, the investment in the business being thereby increased to $10,120,000, on which 8 per cent return would be $809,600. Deducting the same interest and preferred dividend charges would leave earnings for the next year of $369,600, or 18.48 per cent, on the $2,000,000 of common stock. Continuing under the same conditions, at the end of five years the investment would be more than $10,700,000, on the basis of which earnings on the $2,000,000 of common stock would be more than 20 per cent, and yet the rate of return would not exceed 8 per cent. As the corporation issued additional securities the annual interest and preferred dividend charges on the additional securities would, of course, vary from the rates used in the foregoing illustration, according to the investment market conditions prevailing at the time of issuance, with corresponding effect on the rate of common-stock earnings.

Political attacks of the character referred to have been more often directed against companies under holding company control. This was probably because holding companies, before their actual usefulness and important aid in the development of the electric industry were as well understood and as widely recognized as at present, seem to afford targets as so-called "trusts" and "big business," and perhaps, too, because the stronger holding companies were in better position than individual stockholders to permit their operating subsidiaries to retain in surplus and reinvest in the business large proportions of the earnings available for common-stock dividends.

Though earnings are limited to reasonable returns, the assurance of a stable and expanding market for their product or service affords an outlook for soundly capitalized and well-managed electric utilities that warrants the complete removal of their securities from the field of speculation. Many new and important uses for electricity are constantly being found and almost unlimited opportunities exist for further cultivation of fields already entered. Less than 2 per cent of the railroad mileage of the country is electrified, and electricity on the farm, practically unknown until a comparatively few years ago, is now being extensively applied with great savings to the farmer in money and physical effort. Progress along these lines, as well as extensions into new fields, will entail heavy development costs and make it imperative that ample capital be available when needed from time to time.

Within the past few years there has been a notable tendency toward legislative recognition of the advantages to savings banks and trust funds of investing in public utility securities. This tendency will undoubtedly receive further impetus from the growing necessity of making available to fiduciary institutions additional fields for the safe and profitable employment of their large and rapidly growing funds.

Though costs of labor, material and fuel today are still more than 50 per cent higher than the pre-war levels of 1913, the householder pays about 15 per cent less for his electric current than he did at that time, its cost to him being practically the smallest item in the family budget. Service extensions not supported by immediately available revenues have been made to encourage upbuilding of communities and attract industries, and standards of service have been immensely improved. These accomplishments are the result of research, initiative and able administration and have merited the approbation of the public.

Notwithstanding their creditable records, however, the electric utilities cannot merely rest upon their laurels. It is incumbent upon their executives to pursue diligently possibilities of further improving and extending service and reducing charges; to continue to justify public support of their policies of operation and development, and to protect the investments of those who have supplied and must continue to supply the large amounts of needed capital. The dangers of unwarranted attacks have greatly diminished as the public has come to have a better understanding of the problems and affairs in general of the utility companies, and evidence is not lacking of the confidence of the utility companies themselves that, when conversant with the facts, the public will be fair to the industry that has contributed and will continue to contribute so much to its well being.

## Standard Motor Dimensions

SINCE the data were collected for publishing the table on page 1100 of the Nov. 26, 1927, issue of the ELECTRICAL WORLD, giving a comparison of alternating-current motor dimensions the Crocker-Wheeler Electric Manufacturing Company has offered its 50-P motor to supersede the 13-Q motor which was listed. The values for the new 50-P motor corresponding to those listed in the table are as follows:

| | | | Shaft Extension, In. | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Make | Type | Frame | *u* | *n* | *t* | *s* | *h* | *d* | *b* | 2*f* |
| Crocker-Wheeler.. | P | 50 | 1½ | 4 | ¼ | ⅛ | 11/16 | 7 | 10⅝ | 8½ |

| Make | Type | Frame | *a* | 2*e* | *x* | | *m* | *c* | " |
|---|---|---|---|---|---|---|---|---|---|
| Crocker-Wheeler..... | P | 50 | 13⅜ | 11½ | .. | 6 5/16 | 6¼ | 16 11/16 | 13⅜ |

In the original Table I the column under shaft extension, headed "*a*," should have been headed "*u*" to correspond with the diagram.

# A Grounding Policy That Will Promote Development

By D. HAYES MURPHY
*President Wiremold Company*

THE grounding policy recommended by the National Electrical Manufacturers Association committee on grounding and adopted by the association will help to clear the air on this subject, definitely present the manufacturers' viewpoint and possibly prevent a multiplicity of rules that may only retard development.

The proper grounding of equipment has always been a matter of diversified opinion, particularly as regards portable apparatus. The vast majority of manufacturers are so absorbed in the problems of their individual concerns that they often fail to grasp the significance of the larger industry problems, such as proper grounding rules, and the direct bearing which these problems have on their private business. To solve these problems it is only necessary that they be presented in such a way that they will receive serious consideration. The merger of the various manufacturing groups into the National Electrical Manufacturers Association has provided a splendid forum for the necessary discussions and means for putting plans into effect.

By making understood a basic problem of the industry such as this grounding question the N.E.M.A. has recorded an achievement. The manufacturers are bound to support such a constructive movement, which is for the benefit of the industry and the general public. This is a distinct step in the right direction and represents substantial progress on the part of the manufacturers in supplying the public with more and better electrical service.

## Interesting Transformers Used on Conowingo Project

AT THE hydro plant of the Conowingo project and at the large switching station used in the interconnection developments in this region some large and unusual transformers are installed. The Conowingo plant transformers were made by the General Electric Company and are thirteen in number. Each transformer is rated at 26,667 kva., giving a bank rating of 80,000 kva. Four banks of these transformers and one spare are provided. Water-cooled two-winding units are used, which step the voltage from 13,800 to 220,000.

At the Plymouth Meeting substation, seven transformers manufactured by the Westinghouse Electric and Manufacturing Company are to be installed. These units are rated at 33,333 kva. each and, therefore, provide two 100,000 kva. banks with one spare unit at this station. The energy from Conowingo and that from the Pennsylvania-New Jersey interconnection is stepped down from 220,000 to 66,000 volts. On the transformer units, in addition to the 220,000 and 66,000-volt windings, there is a 13,200-volt tertiary winding. This winding is used for the triple purpose of closing the delta, operating synchronous condensers and operating the tap-changing equipment installed on the 66-kv. side of the transformers.

An interesting feature of the Plymouth Meeting transformers is that they are self-cooled and arrangements are made for impinging air on the radiators to obtain high ratings.

# Sales Conference Studying Problems

### One committee now engaged in planning adequate wiring campaign. Whole-hearted support needed to carry out plans when formulated

By W. E. Sprackling
*Chairman Electrical Industry Sales Conference*

IF A MAN is satisfied to let his business run itself, if he does not push it actively because he has heard that we are going to have a fairly prosperous year, his business is headed for the rocks. Likewise, if an industry is willing to sit back and take what is thrown at it without an earnest effort to go out and get something in addition, then that industry is not going to have as prosperous a year as it would have otherwise. In other words, 1928 will be as prosperous as we want to make it.

W. E. SPRACKLING

The favorite indoor sport for business men at this time of year is for everyone to catch the ear of everyone else and wisely whisper therein just what the year 1928 has in store for us. Fortunately for us all, our present national banking system, plus a thorough study of cause and effect on the part of various statisticians and financial agencies, allows us all to shoot fairly close to the mark with our predictions. But all of this information concerns only business in general. It does not mean that every business or every industry will be affected alike. Heaven forbid! Such a thing would mean the burying of initiative—the killing of incentive. It would be a calamity that could not exist.

In the past our electrical industry has been too content to follow the easy-going path of taking what is given to us or at best to pick the business plums that could be reached without effort—let the poor fellow who had to work for a living strain his back for the plums higher up. Now we find that we have grown and need those plums we once scorned. So we all wake up to find that we have with us this "new competition" we hear so much about, and we get together in an Electrical Industry Sales Conference. What to do! Echo answers, "A-plenty." But it can't be done over night. It can't be done in a month. There is no open sesame that will lead us into verdant fields and green pastures. We have got to start in and work for a living. We have got to go back and rework the old fields. We have got to spend some money on fertilizers and new equipment. We have got to do some earnest cultivation of the present market.

The sales conference has decided on one thing which many will say was self-evident—and in that they are correct, of course. The conference said, in substance, "The only way we can sell more current, sell more appliances, more portable lamps, fixtures, transformers and what not, is to have plenty of places in the home to plug in current-consuming devices whether they be two-dollar portable lamps or an electric refrigerator selling at $750." In other words, we must see to it that homes are adequately wired. Therefore the conference appointed an excellent committee representing the best brains in the industry on this particular subject. That committee is now figuring out an "adequate wiring campaign" that will be universal in its operation and nation wide in its appeal.

The committee will have a little more than a month to study the subject, write up its findings and hand in a definite report to the conference at its next general meeting on Jan. 11. That report will call for immediate action. Then the proposition will be placed before the industry as a whole to support the project and help to make the year 1928 more prosperous or else to sit back with that, "let-George-do-it" attitude and wait to see somebody else step forward first and say, "I am with you!" Whatever the plan may be, the industry as a whole is not going to be 100 per cent satisfied with every detail of it. That is one prediction that is easy to make. But whether everyone is sold on every detail of the plan or not, the fact remains that the campaign will be an industry campaign and should be given the whole-hearted support of everyone in the industry.

Another industry problem the conference had put up to it was the problem of the contractor as a group. He is our direct contact with the public as far as wiring installations go. He is at times a fine journeyman, at other times he is only a fair workman; sometimes he is terrible. As a salesman he is a fine mechanic. What to do with him! He is a real problem. And so, the Electrical Industry Sales Conference has taken on this job and has given it to a fine committee that best knows what is needed. It is giving the subject a lot of thought, But its problem is one that is going to take time and patience. No one can expect an immediate solution to that perplexing situation. Suffice it to say that all branches of the industry are joining hands to try to work out an answer.

There are other committees at work as well as the two mentioned. Each has a single broad subject to work on, a particular problem to solve. What does it all mean? Where does it all point? It means that for the first time the electrical industry is working as a unit, that there is a realization of the need for team play. It points toward a time when duplication of effort will cease, when spasmodic attempts by one group will be replaced by co-ordinated group effort.

But while the Electrical Industry Sales Conference can devise the plan and point out the way, it can never hope to go out and put the campaign across of itself. The actual accomplishment of any plan requires the wholehearted, active, enthusiastic support of everyone in every group of the industry. And that is just where each one of us will play his part in making not only the year 1928 more prosperous but 1929 even more prosperous than 1928 and 1930 bigger still. We, as an industry, have it right in our own power to make our prosperity just what we will it to be by the amount of time, effort, interest and money we put into the means of bringing that prosperity to us. The extent of our prosperity lies in our own hands.

## *Favors Support of Flood Control*

*I THINK there is a good deal of popular misunderstanding as to what can be done in the way of flood control. In the past, control has been accomplished in large measure by natural reservoirs which have been increased moderately in capacity. Such control helps but cannot begin to cope with such a situation as existed in the Winooski Valley of Vermont and several other places last November. We were fortunate that the storm did not extend up and down a principal river valley rather than across several states. Had it done the former, one or more cities might have been drowned out. The flow in some New England streams was so great that had it been in the same proportion in the larger rivers, the latter would have had in them five times the normal flow of Niagara—that is, more than a billion and a quarter second-feet in the case of the Connecticut and the Kennebec.*

*To store sufficient water to take care of a condition even approaching the foregoing would be a monumental task even on one river. I believe, however, that a great deal can be done to take care of all ordinary freshets and that there are places on most New England rivers where more water can be stored than we have ever considered possible before if we have co-operation among the different affected interests. A great deal can be done if we can get even a large part of the people interested in any one river. I do not believe that we ought to do it through the federal government, except possibly in the case of immensely large rivers, and even with these, if feasible, the work should be done by the states or by interests working within the states and not by the national government.*—WALTER S. WYMAN.

## Customers in Canada, 1924 and 1925

A RECENT report on central electric stations in Canada, published as a portion of the Census of Industries, 1925, by the Dominion Bureau of Statistics, indicates that there were 1,279,731 central station customers in Canada at the close of 1925. This is an increase of 6.7 per cent over the number at the end of 1924.

In the last year for which statistics are available, there was an increase of about 8 per cent in the number of residential lighting customers and 2.6 per cent in the number of commercial lighting customers, but a slight decrease in the number of power customers. This decrease was confined to the three provinces, Quebec, Manitoba, and Alberta. Taking the country as a whole, the number of domestic lighting customers is about 50 per cent of the total number of families; in the most populous province, Ontario, it runs up to 55 per cent.

## Census Bureau Asks Co-operation

OPERATIONS of American industry are once more to be surveyed and counted by the federal government. The next biennial census of manufactures will cover data for 1927. Until 1919 these industrial censuses were taken every five years, but at the close of 1921 the biennial census of manufactures was instituted. Such an advance in the collection of general production data is in line with the new economic era under the influence of which business and industry has been functioning since the war period. The success of the government in this task will depend almost entirely upon the co-operation received from manufacturers in furnishing the basic data required. The Census Bureau states that manufacturers of the nation can render a real service to industry by returning the government questionnaires just as soon as the basic data are available. The Census Bureau stands ready to do its part immediately the figures are received from the manufacturing plants. The value of the present census of manufactures, therefore, depends upon the co-operation extended by the manufacturers in making early reports of 1927 operations.

Timely data on both production and distribution are absolutely essential to the fullest development of business and industrial management, elimination of waste, both material and physical, standardization and research; and the more timely the data, the greater their value. In the past it has been impossible for the federal Census Bureau to collect, tabulate and make public the complete basic data on production under a year and a half, although data on some special industries have been issued within a year after the taking of the census. The Census Bureau is making every effort this year to make the summary figures available many months ahead of the previous censuses.

## Rural Rates Raise Usage 68 Per Cent

FARMS receiving service from transmission lines in Wisconsin increased during the year ended June 30, 1927, from 9,945 farms to 13,749 farms—an increment of 3,804, or 38.2 per cent. Utilities are not looking necessarily toward the increase of farm customers so much as toward the class of farm connected. They seek increased load density, of course. That the approach of near uniform rate structure is having its effect may be seen in the following: One utility studied the accounts of 2,354 customers on its farm lines. Where modern rate structures have been put into effect, the result of this survey indicated the following average kilowatt-hours per month:

| | |
|---|---|
| First half of 1925, average kilowatt-hours per month....... | 35 |
| Second half of 1925, average kilowatt-hours per month...... | 37 |
| First half of 1926, average kilowatt-hours per month....... | 44 |
| Second half of 1926, average kilowatt-hours per month...... | 59 |

Another study was made of 36 customers, whose old records before the application of a modern rate structure indicated an average of 48 kw.-hr., whereas, after the application of the new rate structure, the average increased to 116 kw.-hr., an increment of 142 per cent. One farmer averaged 606 kw.-hr. per month in 1925 and 1,024 kw.-hr. per month in 1926. Recently a line having 38 rural customers was analyzed with the following results:

| | |
|---|---|
| Number of customers | 38 |
| Total kilowatt-hours in 1925 | 9,563 |
| Average kilowatt-hours per year | 251 |
| Total kilowatt-hours in 1926 | 12,533 |
| Average | 329 |
| Kilowatt-hours in 1927 (seven months) | 23,839 |
| Average | 627 |

This shows an increase of 90.5 per cent for seven months of 1927, as compared with twelve months in 1926.

### Benefit of Commercial Approach

These figures support the opinion that new customers begin service better educated to the value of electrification on the farm than do old customers. Their consumption starting from the outset at monthly figures is greatly in excess of that of old customers. One rural customer recently added to a rural line was properly approached by the commercial department in that area and placed an order for the following equipment: One refrigerator, one washing machine, one vacuum cleaner, one ironing machine, one electric iron, one toaster, one percolator, one electric range. It is easy to understand why this customer's first meter reading indicated a consumption of 363 kw.-hr.

# Letters from Our Readers

## *District Representative Plan Misunderstood*

*To the Editor of the* Electrical World:

I note on page 1311 of your Dec. 24 issue that the writer of the article is laboring under the impression that the Stone & Webster district "representative plan" is primarily for the purpose of selling appliances, instead of what it really is: A complete and adequate "service" established for the purpose of promoting customer understanding and appreciation by a complete, well-rounded and satisfactory effort adequately to serve the public.

To render this complete and satisfying service, among other things the district representative plan substitutes an intelligent, high-grade and adequately trained district representative, whose first duty is to see to it that customers in his district receive adequate and satisfactory service. The representative reads the meters, which duty becomes a means of frequent and systematic contact with the customer, thereby rendering the superior service to be expected from a really competent person. A woman commentator has recently stated that women always like to do business with people whom they know and whom they can trust. The carefully selected and trained district representative fulfills this need.

The kilowatt-hours sold to the average residence customer may be accepted as a practical measure of the satisfying service rendered by the utility. To sell and deliver a large number of kilowatt-hours, the home customer must possess reliable appliances, so satisfactory that they will be in constant use. The practical way promptly to bring about this condition is to see to it that the home customer is induced to purchase the kind of equipment necessary, which will be used because its use is an advantage.

If the utility does not see to it that this is done, development and revenue will lag with the result that customer understanding and appreciation of the service rendered to the customer, as well as good public relations will suffer. If the utility relies only upon other sales agencies than its own, whose sole interest is from the standpoint of merchandising profit, and if it does not lead in sales activities, there is a lack of prompt and adequate development of the service.

The sales effort is but one of several important duties of the district representative. Thorough, systematic and well-directed effort result in better public understanding and appreciation, which is one of the great benefits derived from the district representative plan. Customers recognize and welcome the district representative plan as a superior service and not as a selling scheme, although large sales result. Such an inexcusable episode as that detailed in your editorial "Good Intentions Gone Wrong" (Dec. 31, 1927, page 1335) could not happen under a bona-fide "district representative" plan.

Norman T. Wilcox.

## *Principles Underlying Economical Water Heaters*

*To the Editor of the* Electrical World:

I have been interested in the article appearing in the Nov. 19 issue of the Electrical World entitled "Electric Water Heating" because I have developed equipment of this kind for use on our central heating plant, using steam as the heating medium. I believe all of the arrangements shown in the illustrations could be modified to give an adequate supply of hot water from much less energy.

I have found that if the water is heated very hot, only a very little is necessary; but if not heated so hot, each user will run off a great deal of warm water in the hope of obtaining some that is hotter, resulting in a great waste of heat. To take advantage of this condition, a small amount of water should be heated very hot in the top of the boiler with as little transfer of heat to the bottom as possible, the heater gradually increasing the depth of the very hot water to act as a reserve supply. By having the cold water enter the side of the boiler near the bottom in place of the top, this condition will be greatly improved as to all three of the designs shown.

The heater shown in the third illustration on page 1046, inserted through the side of boiler about half way up, will have to heat all the water above it before any warm water is obtained, while the space below it will be found nearly useless. The heater on the outside, shown in the center cut connected with circulating pipes, will work well when new, but the bottom circulating pipe will gradually get stopped up with dirt, resulting in an overheated heating element and a very poor supply of hot water. The heater inside the boiler and surrounded by a tube would be almost perfect if the tube could be made large and of a non-heat-conducting material, perhaps one tube outside the other with an air space between. If the tube is just an ordinary metal tube, most of the boiler will have to be heated before any real hot water is obtained at the top.

Overbrook, Pa.

# Digest of Electrical Literature

## *Hydro-Electric Development and Steam Equipment*

*Pressure, Temperature and Efficiency of Condensing Turbines.*—E. A. KRAFT.—A general consideration of the theoretical features involved in the design and thermodynamics of modern turbines. The author has considered the various conditions accompanying adiabatic steam expansion from different initial pressures and under varying degrees of superheat. The bleeding of steam turbines for the purpose of preheating feed water has been considered in relation to the thermal efficiency of such practices and in connection with preheating of the steam. Resuperheating of the steam under theoretical and practical conditions and under various adjustments of operating factors, receives attention. It is stated in conclusion that so far as constructional and shop practices, materials and operations permit, it may be maintained that perfection in the design of steam turbines has been nearly achieved.—*A. E. G. Progress, (Germany)* November, 1927.

*Water Softening Practice Developments.*—CHARLES P. HOOVER.—The author has classified the developments in water softening processes according to the following orders: handling of chemicals, mixing devices, Dorr clarifiers, methods for further reducing hardness, substitution of zeolite for soda-ash to remove non-carbonate hardness, and recarbonation. The advantages and practices involved in the pneumatic handling of materials and the application of the chemicals to the water are reviewed and the types of mixing tanks or agitating devices, as well as the disposal of sludge produced as the result of this softening process, and a discussion of the relative stabilization of the softening effect with various types of hardness, are included. A brief consideration of the desirability of using aluminum salts to avoid the incrustation of sand grains through which the water is filtered has been added.—*The Canadian Engineer,* Nov. 15, 1927.

*Pulverized Fuel.*—The serial report of the Prime Movers Committee of the National Electric Light Association includes statements by operating companies utilizing pulverized fuel giving data regarding operating results and maintenance factors. Information received from manufacturers has been included in this report, and developments in design and operation, accompanied by suggestions, are offered by the equipment companies. The committee concludes that there is an increase in the use of turbulent type burners, preheated-air and water-cooled furnace walls, and that the unit system presents some advantages over the central system, although not without its own limitations and that comparative data regarding the two methods should be available within the next year. The statements by operating companies contain data on energy consumption, pulverized coal, boiler ratings, boiler efficiency and maintenance.—*Report, National Electric Light Association,* 1927.

## *Electrophysics, Electrochemistry and Batteries*

*The Generation of Electricity Direct From Heat.*—T. F. WALL.—A discussion of some laboratory experiments in the production of electricity directly from heat and an analysis of the results obtained as a result of such tests. The author states that, in view of the great advances which have been made in recent years in the production of heat resisting alloys and the work which has been successfully accomplished in protecting metals from corrosion, the thermal-electric generator has been brought within the realms of commercial feasibility. As the result of these tests, it has been established that a practical form of generator will have the hot junction maintained at the very highest temperature possible. It is further essential that the internal resistance of such a generator shall be as low as possible. These two fundamental requirements form a basis for the design in practical form of a thermal-electric generator. The author's experiments have led to the general conclusions that a gas-ring heated thermal-electric generator cannot be expected to have such a high average thermal efficiency as a coke-fired generator. The definite convenience and ease of control make a gas-ring generator a useful substitute for small accumulators, particularly for such purposes as these where a steady source of electromotive force is required. This type of thermal-electric generator may provide a valuable means for charging electric storage batteries. For a coke-fired generator, the values of the thermal efficiency become from 3 to 4 per cent, when the generator is delivering its maximum output, and 12 to 16 per cent when the generator is short-circuited.—*The Electrical Review—(England),* Nov. 18, 1927.

*High-Frequency Currents.*—E. W. MARCHANT.—A general discussion of the characteristics of high-frequency currents is offered in this article. The oscillatory discharge of a condenser, the Faraday-Mossotti theory of polarized particles, the magnetization of iron at high frequencies, the high frequency surges in electricity-supply networks, the production of electric waves by high-frequency currents, the determination of the power factor of a dielectric from the cyclogram and a method of showing magnetization curves with a cathode-ray oscillograph, are all considered.—*The Journal of the Institution of Electrical Engineers, (England),* November, 1927.

## *Generation, Control, Switching and Protection*

*Sudden Short Circuit of Alternators.*—SADATOSHI BEKKU.—The mathematical solution of the problem involving a sudden short circuit upon a symmetrical three-phase alternator may be obtained by solving the simultaneous differential equations. The author has applied the linear transformation of the method of symmetrical co-ordinate and the fundamental differential equation assumed minimum complexity. Heaviside's expansion theorem was applied to this case and the actual computation involved few difficulties. The mathematical solution of the problem involved in the case of the ordinary salient pole alternator upon sudden short circuit was found to be too complicated for ready solution but was verified from experiment which indicated that the machine may be treated as the ideal symmetrical alternator of appropriate electrical constants, without causing any serious error. The concept of the equivalent symmetrical alternator is convenient for the study of transients and the constants may be determined by various measurements. The three-phase short circuit current may be considered to consist of damped, direct current components, tending to zero, and the damped alternating current components tending toward the sustained short circuit current. The damped alternating current component may be considered as the constant induced voltage provided by the variable positive phase sequence impedance. From calculations and tests the assumption has been verified that the transient positive phase sequence impedance just after the occurrence of short circuit is practically equal to the sustained positive phase sequence impedance of the alternator. The latter is constant for the sudden application of negative phase sequence voltage. The author concludes that the short circuit current of the ordinary alternator may be calculated from several measured data, which are open circuit tests, short circuit tests, stator resistance and negative phase sequence impedance.—*No. 203, Researches of the Electrotechnical Laboratory* (Tokyo).

## *Illumination*

*Improved Designs for Stage Lighting Equipment.*—W. C. BROWN AND F. M. FALGE.—Developments in types of theaters and of presentation, as well as the growth of syndicate management, have brought about notable improvements in stage-lighting facilities. The authors have summarized the limitations of older practices in stage lighting, the requirements of the various classes of equipment and the characteristics incorporated in modern design. The discussion is limited to general stage lighting and does not treat of the important class of operations utilized for a special effect. Footlights, overhead lighting, proscenium borders, border lights, cyclorama lights, floodlights and spotlights are all considered in connection with their use for achieving the desired illumination. Suggested balances in illuminating effects have been made specific in several instances. — *Transactions of the Illuminating Engineering Society*, 1927.

*Farm Lighting.*—W. C. Brown.—The principles and construction methods involved in the satisfactory illumination of farms, houses, barns and outside areas is the subject of this bulletin. A general exposition of the principles of good lighting as related to the sufficiency of light and the elimination of glare, as well as the correct size of reflector for the type of bulb required, and the selection of lamps of the proper voltage, receive specific recommendations for the lighting of each of the structures found on farm properties. The lighting of the farm home, including the various rooms, hallways, passages, etc., is discussed, and recommendations for the installation, wiring, wire size and general construction are made—*Bulletin No. 53, National Lamp Works.*

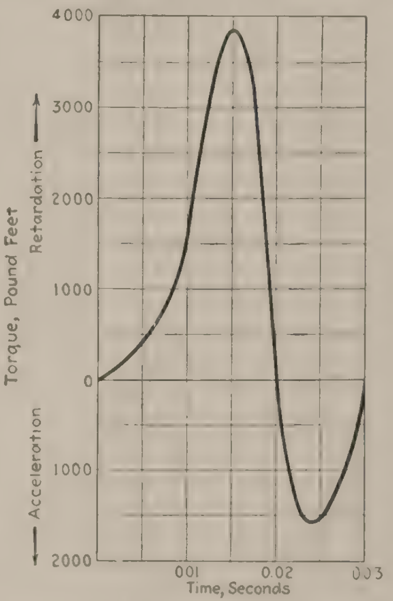
## *Transmission, Substations and Distribution*

*Hollow Conductor for 220/380-Kv. Line.*—D. I. Fuchs-Rieks.—The Rhine-Westphalian double-three-phase transmission line has a length of 125 miles and will operate at 380 kv. A hollow copper cable, made of two layers of rectangular strands, wound over a twisted copper ribbon was chosen. The outside diameter of the cable is 1⅝ in., and its weight is 14,400 lb. per mile. Complete mechanical tests were made in the laboratory on sample pieces of this cable to establish its safety. An ultimate rupturing strength of 29,500 lb. was measured. The cable was shipped on large drums, each holding 6,700 ft. in one piece. A number of interesting details are given, describing the method of installing this heavy cable on the high steel towers of the line. Thirteen long-span river, valley or road crossings had to be provided. Ten-disc insulators of either single or double string type, equipped with a top and bottom ring equalizer, insulate the six lines from the towers.—*Siemens Zeitschrift*, October, 1927.

*1,000-kw. Complete Automatic Portable Sub-station for British Columbia Electric Railway Company.*—In an endeavor to secure an adequate source of reserve equipment to insure complete continuity of service, a 1,000-kw. automatic sub-station was mounted upon a flat car and a superstructure built around a portion of it. This installation consists of a 1,000-kw., 600-volt, direct-current, 6-phase, 60-cycle rotary converter; 1,100 kva., 3-phase, self-cooled transformer, adaptable to converter voltages of 34,500 and 11,500; a motor-operated high-tension oil circuit-breaker and all accessories, including alternating current and direct current lightning arresters, gang-operated air-break switches, and two service-restoring 1,000 amp., direct-current feeders. The converter and switchboard are inclosed, while the transformer, oil circuit-breaker and other high-tension apparatus is of the outdoor type and is mounted on the uncovered portion of the car. The station is full automatic, being started and stopped by load demand. It is fully protected against low voltage, phase failure, phase reversal, alternating current overload, direct current overload, overheating of the converter windings, overheating of the converter bearings, reverse polarity, overspeed, phase unbalance, loss of field, and direct current reverse current. The power transformer and instrument transformers may be connected to operate either from an 11,500 or a 34,500-volt line.—*Electrical News (Canada)*, Nov. 15, 1927.

## *Units, Measurements and Instruments*

*An Instrument for Measuring Short-Circuit Torque.*—B. W. Penney.—It is stated by the author that the torque produced by a short circuit, or other transient will cause a corresponding acceleration of the rotor of an electrical machine. If the rotor is not connected to a load, the acceleration will be directly proportional to the torque. A small instrument is described which can be attached to the end of the shaft of the machine to be tested. This device records the instantaneous acceleration of the rotor, the corresponding torque being calculated. The acceleration is measured by two separate methods. The first method gives points on an acceleration time curve, and the second gives a continuous record of the torque. The change in velocity is recorded on the oscillogram, so that, by using a six-element oscillograph, a simultaneous record can be obtained, showing both the acceleration and the short circuit currents. The mechanism for closing the short circuit at the desired point of the voltage wave and the method of checking the accuracy of the instrument are described. The instrument can also be used for measuring sudden shocks to motors and other rotating machinery.—*Journal of the American Institute of Electrical Engineers*, November, 1927.



TORQUE-TIME CURVE FOR A SINGLE PHASE SHORT CIRCUIT

## *Telegraphy, Telephony, Radio and Signals*

*The Development of the Televox.*—R. J. Wensley.—Automatic substation control may be secured by means of a recently developed device, without the necessity of any communication wire other than the customary telephone line. When the telephone bell rings, this instrument lifts the receiver and a characteristic musical note indicates the receptive condition of the apparatus. A buzzer at dispatching headquarters emits a tone of definite frequency and a sending of the desired number of impulses will cause the proper circuit to function. Operation is then secured through the use of a tone of another frequency and upon completion of the transaction, the machine cuts itself off. The dispatcher's phone is entirely free from attachments, as is the receiving phone in the substation. This device is not limited to local exchange service, but may be used over toll lines, thus enabling the centralized operation of extensive transmission systems with no expense other than toll charges.—*The Electric Journal*, December, 1927.

## *Miscellaneous*

*Structure of a Protective Coating of Iron Oxides.*—Richard M. Bozorth.—This investigation constitutes an X-ray analysis of a Bower-Barff protective coating on iron, showing the chemical constitution and order and thicknesses of the three layers composing the coating. In the preparation of this coating the iron was heated to 730 deg. F. in an air-tight furnace and brought into contact with steam for about an hour, cooled slightly in the air, reheated to 715 deg. F. with steam again for another hour and cooled in the air. This method produced a coating between 0.1 and 0.3 mm. in thickness. Chemical analysis of this coating cannot determine definitely the amount of any phase because it cannot determine what phases exist. The X-ray analysis described by the author does, however, not only distinguish between the three oxides and give a means for estimating roughly the amounts of each present, but also permits the determination of the position of any phase relative to the other phases and to the iron on which the coating is formed. This analysis shows that three oxides are present in layers parallel to the surface X-rays of two wave lengths of different penetrating power are reflected in turn from the surface of the sample. The relative positions of two layers, each composed of one oxide, can be determined from the relative intensities of lines due to each oxide on photographs taken with iron and copper.—*Reprint* B-247, *Bell Telephone Laboratories, Inc*

# Book Reviews

## *Engineering of Power Plants*

By R. H. Fernald and G. A. Orrok. Third edition. New York: McGraw-Hill Book Company, Inc. 663 pages, illustrated. Price, $5.50.

In the revised edition of this good text on power plants the authors have done a fine job. This book has been notable in that it gives cost values and dimensional figures for power-plant equipment, and therefore a big task looms up when these data come up for revision in new editions. It takes daring to put cost figures on power-plant equipment, and the authors warn their readers that the values are only relative or approximate; but it is good engineering to use tangible data in colleges and it is a good idea to introduce economics into power-station classes. Accurate data are not needed to bring out methods of economic analysis in the selection of power-plant equipment.

Twenty-six chapters in this book outline the whole power-station field as it exists today and introduce to readers the equipment available and the present practices in power-station design. All through the book an economic and commercial rather than a theoretical point of view is found. The authors discuss power plants in terms of equipment or of application, and general considerations are brought out whereby the element of common sense is developed in the student. While primarily a college text book, there are many engineers who will find the new edition very valuable.

## *Direct Current*

Vol. I. Second edition. By Chester L. Dawes. New York: McGraw-Hill Book Company, Inc. 582 pages, illustrated. Price, $4.

In the second edition of this text the author has revised several chapters, added new material and inserted new problems. It is a companion volume to his work on alternating currents and is notable for its clear and logical presentation of the subject matter. Fundamental definitions and measurements are accented, and the material is of sufficient scope to cover the subject thoroughly. The measurement chapters, the magnetic-circuit treatment and complete material on batteries are features of the text. A larger set of new problems will add to the value of the new edition.

## *Hochspannungstechnic*

By Arnold Roth. Berlin: Julius Springer. 534 pages, 437 illustrations, 3 inserts, 75 tables.

To a considerable extent practice has anticipated theory in the design of high-tension apparatus, in the author's view, the insulation being simply strengthened at points found to be weak until it stood up under operating conditions. This is ascribed to the circumstance that theory dealt with certain assumed ideal conditions—for instance, smooth cylindrical conductors for transmission lines—whereas in practice these had slight projections or rough places favoring dielectric breakdown. In machinery local overvoltages caused failures and were combated by practical measures before their cause was fully appreciated. The purpose of the present volume is evidently to give a physical picture of what is known to occur, by a liberal use of oscillograms, photographs of arcs and flashovers, and diagrams, rather than to present mathematical theories. Formulas are by no means absent; discussions of line oscillations, traveling waves and reflections are scarcely conceivable without the use of equations, but the latter are here simplified by omitting minor factors or terms, and are thus kept out of the realm, for instance, of hyperbolic functions. The book should be particularly helpful to the reader who wants to visualize the mechanism of high-tension disturbances, perhaps as an introduction to more highly analytical treatises.

## *Rotary Converters: Their Principles, Construction and Operation*

By E. P. Hill. New York: D. Van Nostrand Company. 329 pages, illustrated.

Principles and operating characteristics of rotary converters are treated in this book and design details are subordinated. It is a reference book for students and a very good book for engineers concerned with the purchase, testing, installation and operation of rotary converters and auxiliary equipments. Some design formulas and a large amount of basic theoretical matter are supplemented by good graphs, photos and commercial data. Transformers for rotary converters, starting methods and equipments, service operations, operating characteristics, and specifications and tests are fully treated. The book is a welcome addition to the existing literature on the subject matter.

## *Thermionic Phenomena*

By Eugene Bloch. Translated by J. R. Clarke. New York: E. P. Dutton & Company. 145 pages, illustrated. Price, $2.50.

The phenomena of electrical conductivity in the neighborhood of substances which are heated to a sufficiently high temperature are discussed in this book by Professor Bloch. Recent theories and researches are incorporated, especially those of Dr. Langmuir. Thermionic emission from hot substances has afforded study for scientists since 1895, and since 1910 it has supplied engineers with many new and valuable tools. Yet today, aside from a few principles, the phenomena still baffle scientists in large measure. Quantitative values are inaccurate, and what actually goes on cannot be explained on a qualified basis. Metals and salts give thermionic emissions which can be measured and studied. This is a surface phenomenon, resulting from ionization as generally accepted, but the laws of dissociation of ions, with temperature, materials, pressure and other variables, remain to be fixed accurately.

Fortunately the vacuum tube, the radio tube, the X-ray and other devices relying upon thermionic emissions have been developed and can be used. Many more useful devices lie in the future. In this little book the subject of thermionic emissions is outlined briefly in theory, in experimentation and in practical application. It is a good book to read to get a bird's-eye view of a new development in engineering.

## *Electric Currents in Telephone and Telegraph Conductors*

By J. A. Fleming. Fourth edition, revised and extended. New York: D. Van Nostrand Company, Inc. 415 pages, illustrated.

In the new edition of this excellent book Professor Fleming has revised and brought up to date the material of the older editions and has added a new chapter to treat of nickel-iron alloys, thermionic repeaters and other new developments. Carrier telephony, phantom-circuit applications and a consideration of inductive co-ordination add to the completeness of the book. This volume has long been notable for its praiseworthy presentation of a very difficult subject approached mathematically.

The late Oliver Heaviside and other writers used complicated mathematics, but Professor Fleming, using methods developed by Professor Kennelly, developed a treatment which can be understood without great labor. The book has long been a reference work and textbook for American colleges, and the new edition will be welcomed.

## Books Received

*Electrical Power Transmission.* By E. A. Loew. New York: McGraw-Hill Book Company. 388 pages, illustrated. Price, $4.

*Mathematisches Praktikum.* By Dr. Horst von Sanden. Leipzig: B. G. Teubner. 122 pages, illustrated.

*Physikalisch-Technischen Reichsanstall.* Berlin: Julius Springer. 642 pages, illustrated.

*Commercial Survey of the Southeast.* By John M. Hager. Washington, D. C.: Government Printing Office. 477 pages, illustrated. Price, $1.

*Mechanical World Year Book.* Manchester, England: Emmott & Company, Ltd. 348 pages, illustrated. Price, 1s. 6d. net.

*Emile Berliner, Maker of the Microphone.* By Frederic William Wile. Indianapolis: Bobbs-Merrill Company. 351 pages, illustrated. Price, $4.

*Electric Control Gear and Industrial Electrification.* By William Wilson. New York: Oxford Press. 336 pages, illustrated. Price, $8.50.

# News of the Industry

## Honor Paid to W. W. Freeman

*James H. McGraw Award Medal for Co-operation Presented to Him at Banquet Attended by Many Prominent Executives*

A DISTINGUISHED company of electrical men paid tribute to W. Winans Freeman on Tuesday evening at a dinner given at the Hotel Roosevelt, New York, on the occasion of the presentation of the James H. McGraw Award medal for co-operation. Prominent executives of the central-station, manufacturing, jobbing and contractor-dealer industries, to the number of three hundred, from Eastern points and as far west as Chicago, gathered to express the approval of the industry of the outstanding service rendered by Mr. Freeman in accomplishing the reorganization of the Society for Electrical Development, by which its directorate has been made officially representative of the major national associations of the industry. It was in recognition of this that the medal was awarded.

Mr. Freeman is chairman of the Union Gas & Electric Company of Cincinnati, vice-president of the Columbia Gas & Electric Company, New York, and for eight years has been president of the Society for Electrical Development. The speaking program constituted a symposium by the executives of the organized industry, Howard T. Sands speaking for the National Electric Light Association, Clarence L. Collens for the National Electrical Manufacturers' Association, George E. Cullinan for the Electrical Supply Jobbers' Association, Joseph A. Fowler for the Association of Electragists and J. E. North for the League Council.

P. G. Gossler, president of the Columbia Gas & Electric Company, paid a personal tribute to Mr. Freeman, and Owen D. Young, chairman of the General Electric Company, eulogized the practical ideal which is the basis of the McGraw Award, the recognition of the service of individuals in the advancement of the industry.

Mr. McGraw, in presenting the medal and purse, further developed this theme. He said:

> The greatest problem in our highly specialized business world of today is the development of men. If highly organized corporations are so dependent upon individuals for the necessary enthusiasm and initiative, how much more urgent is the need of the great industry? In a close-knit business organization there are many practical incitements and rewards for original thinking and the independent exercise of resourcefulness and responsibility. But the work men do in the broad interest of an industry finds no such ready recognition and recompense. The time most men give to association activities is usually wrested from the day's work and is only accomplished by personal sacrifice and an increase of the loads they carry.

Blank-Stoller, Inc.

W. W. FREEMAN

> It is impossible, however, to overestimate the importance of national policies and purposes in the affairs of an industry. National ideals and ethics inspire broad, embracing programs that can only be accomplished as a product of co-operation. They influence the results which both the local and the company policies may be expected to effect. Such ideas as standardization within an industry, elimination of waste through simplification in the number of excess and duplicating varieties of manufactured products, uniformity in terminology, co-ordinated or co-operative sales campaigns and a dozen other expressions of industry co-operation could never have been initiated or established but for the leadership of men who were willing to take time from their own personal and company affairs to work for the co-operative development of the common purposes of the industry in which they were engaged.
>
> It has been an unfortunate and perhaps a costly thing to industry that it has been so difficult in the past to recognize contributions made by men in association work or as individuals. There has been no official time or place nor appropriate occasion in which their services to the industry could and would be acknowledged and publicly recognized as a natural expression of the industry's appreciation. We must strengthen the appeal of co-operative work among eligible men, and if we are to develop this we must find many ways in which the individual may find the rewards that come through the attention, the understanding and the sympathy of the industry for which he works, without which he cannot find full satisfaction and feed the fire of his spirit. I hope that through the years to come these awards may assist in encouraging men to think for the broader interest of the industry at large.

Mr. Freeman received an ovation. In responding he dwelt upon the promise of broadened opportunity now opened to the electrical industry through the closer unity that has been effected between the national associations. He modestly insisted that the credit for the accomplishment should go to his associates on the directorate of the society and to the staff.

Charles L. Edgar, president Edison Electric Illuminating Company of Boston, was chairman of the dinner committee. Frank W. Smith, vice-president United Electric Light & Power Company, New York, was toastmaster.

Mr. Freeman was selected for the award by judges representing the four branches of the industry—J. E. Montague, S. L. Nicholson. G. E. Cullinan and James R. Strong. The following citation accompanied the medal presented to Mr. Freeman:

> W. Winans Freeman, chairman of the Union Gas & Electric Company, Cincinnati, and vice-president of the Columbia Gas & Electric Company, New York, as president of the Society for Electrical Development for eight years, has been an outstanding leader in the cause of co-operation in the electrical industry. He came to head the society at a time when, owing to a lack of official tie-in with other industry organizations, it was an imperfect instrument. But the time was not then ready for an actual affiliation between the national groups, for electrical men had not yet become convinced of the industry's need, in the field of market development, for centralized leadership and service. In the face of problems and difficulties which would have proved insuperable to men of ordinary courage, Mr. Freeman carried forward the work with unflagging zeal and confidence and, by his personal encouragement and guidance, made possible the more rapid and effective organization and development of local electrical leagues throughout the country and the establishment of other valuable services to electrical progress.
>
> Despite discouragement, he held to the task until a year ago the critical financial condition of the society arrested the attention of the industry and compelled decision, whereupon with unabated confidence and enthusiasm Mr. Freeman seized the opportunity to make the problem officially an industry concern and, at a heavy cost of his personal time and energy, brought about a sweeping reorganization of the society directorate. By the appointment of the presidents and managing directors and other representatives of the four major national associations of the electrical industry and the League Council, he achieved a broad official co-ordination of all electrical interests, so that the directorate of the society now becomes practically a council of the industry.
>
> In recognition of this distinguished contribution to the advancement of the spirit and practice of co-operation among electrical men, the judges have awarded to Mr. Freeman the medal and purse for co-operation for 1927, given under the James H. McGraw award.

# Manufacturing Profits and Policies

## Federal Trade Commission Dwells on These in the Second Part of Report on Electrical Industry—Holding Companies Weighed—N.E.L.A. "Lacking in Frankness"

LITTLE to support the demand for an investigation of the electrical industry is contained in part two of the Federal Trade Commission's report, which was sent to the Senate on Jan. 12. While the report points out that "the financial operations of holding companies escape state regulation" and mention is made of complaint that the state commissions must pass upon the allowance of items without having the authority to obtain information regarding their reasonableness, there is nothing in the report suggesting centralized supervision of the industry from Washington. It seems to be the idea of the Trade Commission that there might be federal legislation which would give the state commissions more latitude in obtaining information from companies chartered in another state. The Federal Trade Commission's summary of its report follows, with small omissions:

The General Electric Company has been for many years the largest manufacturer of power-plant machinery and equipment in the United States. Its value of sales billed increased from $16,000,000 in 1893 (the first complete year after its formation) to nearly $327,000,000 in 1926; its total investment increased from about $51,000,000 in 1893 to nearly $382,000,000 in 1926, and its net earnings were a little less than $3,000,000 in 1893 and (before deducting federal income taxes) over $59,000,000 in 1926.

As compared with the census classification of "electrical machinery, apparatus and supplies," which includes important products that are not used by the electric power industry, the value of the General Electric Company's output has represented from 16 to slightly more than 20 per cent of the total value for the country in recent census years. For the more important units of electric power equipment the General Electric Company's proportion is larger, representing for the census years 1919, 1921 and 1923 from 46.9 to 51.6 per cent of the value of all generators, from 52.2 to 58.3 per cent of the transformers, from 34.2 to 42 per cent of the motors, and from 32 to 45.1 per cent of the control apparatus. These percentages measure roughly the importance of the General Electric Company as a producer of the heavier lines of power equipment.

Prior to 1925 the three largest companies were the General Electric Company, the Westinghouse Electric & Manufacturing Company and the Allis-Chalmers Manufacturing Company. In 1925 the American Brown Boveri Electric Corporation, a domestic company manufacturing under American and foreign patents and technical information, was organized, thereby adding a fourth company to the group. The Brown Boveri company acquired several important firms manufacturing transformers, switches and electric railway equipment.

### Manufacturing Profits

During the five-year period 1922-1926 the rate of profit of the General Electric Company, before deducting federal income taxes, ranged from 11.2 per cent to 16.2 per cent. Considering only the earnings on its investment in the electric manufacturing business (i.e., excluding outside investments), the rates of return during the same period ranged from 14.3 per cent to 22.8 per cent. The profits of other electrical companies were not obtained for this period, but for 1924 financial reports were received from 79 companies engaged to a greater or less extent in the manufacture of goods used by the electric power industry. The average rate of return for these companies, which had an aggregate total investment of about $490,000,000, was 9.6 per cent in 1924 as compared with 15.1 per cent for the General Electric Company, though some of these companies had higher rates of return than the General Electric Company.

The inquiry respecting competitive conditions in the manufacture and distribution of electric power equipment was limited to those lines, such as generators, transformers, motors, switches and switchgear, station equipment and line materials, that are essential to the production and distribution of electrical energy. Prior to 1925 the manufacture of such equipment was carried on partly by the three large companies mentioned above, generally known as "full-line" companies, manufacturing practically all kinds of power equipment, and partly by a large number of smaller "short-line" companies, confining their production in some cases to a single kind of equipment.

### Large and Small Companies

The prices of these large companies are regarded in the trade as maximum levels above which the other comparatively small manufacturers generally cannot hope to sell. It is also the general belief among these comparatively small manufacturers that the large companies compete actively in price, quality and service. Some small manufacturers stated that although the large companies undoubtedly have the power to crush them by price competition, this power has not been used in recent years. It was stated, however, by certain small manufacturers of fractional-horsepower motors that in recent years prices have been reduced to levels at which they have been unable to compete. Many small manufacturers, on the other hand, stated that other small companies rather than the very large ones are their sharpest price competitors. The general opinion among the many small manufacturers called upon was that the General Electric and Westinghouse companies dominate the trade chiefly because of their financial resources, country-wide distribution and service organizations and their control of many of the largest wholesalers. The elements in the competition of the large companies that are most difficult for the small manufacturers to meet are the lump-sum bid, the quantity discount and the consignment of motors. There was some complaint of oppressive patent litigation, but no substantial evidence has been obtained on this point.

Preference for the equipment of one manufacturer over that of another because of previous installations plays an important part in the purchasing of some power interests, but in general power companies secure competitive bids and appear to purchase their equipment from the lowest bidder, other conditions as to the guaranteed efficiencies, times of delivery, etc., being satisfactory. Some large power groups distribute their purchases among different manufacturers for the specific purpose of maintaining competition.

Several manufacturers stated that prior to 1925 they were unable to sell to companies affiliated with the Electric Bond & Share Company, which was then controlled by the General Electric Company. Executives of the Electric Bond & Share Company stated that the company's policy had always been to purchase from the General Electric Company only in case the latter's prices and terms were at least as favorable as those of other companies. A study of the generators in use during 1925 in the plants of companies affiliated with the Electric Bond & Share Company, however, showed that for specified five-year periods within which such generators were installed from 1905 to 1925 91 to 97 per cent were of General Electric make, as compared with from 60 per cent to 75 per cent for other privately owned companies not so affiliated and from 36 to 44 per cent for municipal plants.

### Patents and Research

The General Electric and Westinghouse companies, through their research organizations, have been leaders in developing patents, technical information and manufacturing experience in the nature of trade secrets that are of value to companies in foreign countries. Foreign companies likewise have patents and information valuable to companies in America. The result is that these two large American companies have severally entered into contracts with numerous large electrical manufacturing interests in the principal foreign industrial countries. By these contracts each party, among other things, makes the other its exclusive licensee under its patents in a specified territory. Thus these two large American companies have obtained the American rights under the foreign patents of many of the most important foreign companies. These rights may be used or withheld from use as the big companies see fit, as no other American manufacturer can obtain the rights without the consent of their American holders. Thus potential competition both of the foreign companies and of other American manufacturers who might otherwise obtain rights under the foreign patents is eliminated.

In the beginning of the electric power industry two or more independent plants frequently competed in supplying electrical energy in a given locality. This, however, resulted in comparatively small plants and in duplication of distribution lines, with resulting high costs for the energy sold by each of the competing companies. Consolidations of local companies followed, until at the present time each city or district usually is supplied by a single operating company. In most states these local monopolies are recognized by laws declaring them to be public utilities subject to governmental regulation. State regulation of sale of power is confined to intrastate commerce. The growing movement of power across state lines, with the development of large operating units and their connection to form larger so-called "superpower" systems, is steadily increasing the importance of interstate commerce in power, which is beyond the field of state regulation and for which there is at present no adequate provision for federal regulation.

### Holding-Company Situation

Particularly during the last twenty years, numerous so-called holding companies have grown up which control, finance and manage local operating companies, sometimes situated in as many as twenty or more states. These holding companies normally own only voting stocks amounting in many cases to not more than 25 per cent of the total outstanding capitalization of operating companies. In many states the issuance of securities by operating companies and the expenditure of funds raised thereby is subjected to state regulation. The final transactions of a mere holding company, however, controlling operating companies in a given state but chartered in another state, escape direct regulation, because the holding company is not engaged in intrastate commerce in that state nor even doing business there. Consequently, the opportunity for unchecked speculative pyramiding of holding-company structures exists, and it has been exploited by the sale to the public of a large volume of holding-company securities that are based upon their equities, merely, in what has been aptly described as the "control of control" of operating properties. Not only do the financial operations of holding companies escape state regulation, but the fees charged for their services to operating companies likewise occasion difficulty to state regulatory agencies. Fees for financing and construction services are allowed to be capitalized as a basis for rates, while fees for operating management are chargeable to operating expenses. State commissions must pass upon the allowance of these items without adequate authority to obtain information regarding their reasonableness, if the holding companies are incorporated in other states. Some complaint on this score has been noted in particular instances.

### RATE REGULATION

Rate regulation was one of the earliest and still is the most important function of state regulatory bodies. The determination of the amount of investment to be used as a basis for measuring the fairness of rates is an important feature of rate regulation. The view of the Massachusetts and other state utility commissions as well as of the Interstate Commerce Commission that capital honestly and prudently invested should be taken as the controlling factor in the determination of fair and reasonable rates appears to be gaining ground. It is the frequent practice of holding companies, however, to group a number of local operating companies and merge them to form a single large operating company, with the possibility of profit to the holding interests in the turnover of the properties. Applications to state commissions for increased valuations following such mergers sometimes have been made and allowed.

The characteristic feature of the power industry under governmental regulation is the absence of competition in the usual sense of the word. Electric power, however, is in constant competition with other forms of power, particularly in the manufacturing industries. Electric power companies, therefore, frequently offer exceptionally low rates to induce industrial concerns to buy power rather than to produce it, and they also make sales to distributing companies at low rates. Such low rates, often made by special contract and with little or no effective supervision by regulatory agencies, may be for sales of power in interstate commerce, in which case state commissions do not have jurisdiction. Consumers of electrical energy for lighting, however, whose aggregate consumption represents not more than 25 to 30 per cent of the total demand but who pay 60 to 70 per cent of the gross amount derived from sales of energy, are dependent upon effective public regulation to insure that their rates are fair.

A notable feature of the power industry is the competition among holding-company interests to acquire desirable operating properties in various states. The frequent result of this competitive bidding, it is alleged, is speculative fluctuations in the prices of voting stocks of operating companies, for which prices paid often do not coincide with book equities nor bear any reasonable relationship to past or probable future earning capacities.

### THE INDUSTRY ASSOCIATIONS

The power industry has a large and very active trade organization—the National Electric Light Association, which in 1926 included in its nine classes of membership 15,820 of the leading power operating and holding companies, manufacturers of electric power equipment, engineers, scientists and others interested in the development of the power industry. The object of the association, as set forth in its constitution, is to advance the art and science of the production, distribution and use of electrical energy largely through educational methods. The association's activities may be classed under three general heads: (1) Compilation and dissemination of technical and other information; (2) co-operation with other organized groups of manufacturers, dealers, engineers, scientists, financial interests, underwriters and with state and federal governmental agencies in the consideration of matters affecting the power industry, either directly or indirectly, and (3) educational activities intended to create public good will for the industry as at present conducted under private ownership subject to public regulation. Through its extensive divisional and committee organization, co-operation with technical, trade, financial, governmental and other organizations, and through its contacts with the press and other agencies for the molding of public opinion, the association undertakes many lines of activity that are unusual in trade association programs, and until quite recently, at least, it has sometimes been lacking in frankness toward the public.

There were formerly two manufacturers' trade associations and one manufacturers' social organization, federated under what was known as the Electrical Manufacturers' Council, which in 1927 were consolidated under the name of the National Electrical Manufacturers' Association. The council exercised an unusual amount of control over the activities of its constituent associations in applying the rule that all acts or proposed activities should be subject to review by the council's legal committee and its employed counsel. In this way the council was apparently alert in keeping the manufacturers' association activities in line with the requirements of the anti-trust laws.

## Rate Cut to Save Cleveland Consumers $1,500,000

Announcement has been made by the Cleveland Electric Illuminating Company that a reduction amounting to approximately $1,500,000 will be made this year in the cost of electricity to residential and commercial consumers because of lower rates. The reduction was made possible by increased efficiency and economy in generation of electricity, according to company officials, and, in accordance with its policy, is passed on to the consumer. This is the third reduction announced by the company in the last four years.

The new rates as announced are 5 cents per kilowatt-hour for the first 80 kw.-hr., 4 cents for the next 420 kw.-hr. and 2.8 cents for all energy over 500 kw.-hr a month. The former rate was 5 cents for the first 500 kw.-hr. and 2.8 cents for more than 500 kw.-hr.

## Boulder Dam Bill Is to Be Reported Favorably

*Committee So Decides, Despite Vigorous Opposition from Arizona Men—Four of Secretary Work's Fact-Finding Advisers Report*

A FAVORABLE report on the Swing-Johnson Boulder Dam bill will be made Jan. 14 by the committee on irrigation and reclamation of the House of Representatives. An announcement to this effect was made Jan. 10 by Representative Smith of Idaho, the chairman of the committee.

Mulford Winsor, president of the Arizona State Senate, appeared before the committee and urged that no legislation be enacted until an agreement can be reached by all of the states in the basin. It was declared that a similar view is held by Utah, Wyoming, Colorado and New Mexico. Representative Douglas of Arizona told the committee that the bill was unsound and summarized his reasons for that conclusion as follows: (1) Because by its very terms it implicitly provides for additional appropriations in excess of the $125,000,000; (2) by its very terms construction work and expenditures of money cannot be begun before firm and binding contracts for the sale of electrical energy are in hand; (3) because, even though contracts in hand be necessary and essential under the terms of the act before construction work could be begun or expenditures made, it will be impossible to obtain such contracts; (4) because the federal government can never be reimbursed for its expenditures, even assuming that it could obtain contracts; (5) in the absence of an agreement with Mexico, or pronouncement placing Mexico on notice, the construction of a dam at Boulder Canyon under the terms of the Swing-Johnson bill will provide a regulated flow of water which can and will be so applied to beneficial use in Mexico that the southwestern part of the United States will be seriously affected in its agricultural development throughout its entire future.

H. S. McClusky, a member of the Arizona Commission for the Colorado River, told the committee that in considering charges that the "Power Trust" is financing the opposition to the Swing-Johnson bill attention should be given the fact that "a pernicious lobby is lined up in support of the measure." He said further that a former governor of Pennsylvania and the Hearst organization are connected with this lobby.

Secretary Work of the Interior Department wrote to Chairman Smith indorsing the bill, and the committee had also before it four reports from as many advisers named in April by Secretary Work to consider the project from every angle. Senator Waterman of Colorado, a fifth adviser, has not yet reported.

The advisers, including James R. Garfield, former Secretary of the Interior; Governor Emerson of Wyoming, former Governor Scrugham of Nevada and Professor William F. Durand of Stanford University, reported individually on questions asked by the Secretary as to the feasibility of the project and whether or not the government could and should proceed without unanimous approval of the Colorado River Basin states.

Indorsement of the project is contained in the Garfield report, which also urges its immediate construction, primarily because of flood menace to the Imperial Valley. It holds that the federal government has the right to proceed.

The Scrugham report, while urging immediate action, deals largely with the power to be developed, and suggests a plan for allotment of power which Mr. Scrugham believes would be approved by Arizona, Nevada and private power interests.

While recognizing the need for flood protection, Governor Emerson insists that the Colorado River compact should be ratified by all seven states before the proposed legislation is enacted.

Engineering features stand out in the Durand report, which emphasizes the flood danger and declares that the All-American Canal, which its proponents hold would relieve the Imperial Valley from dependence upon Mexico for water, is not only an urgent need, but that it could be constructed for considerably less than the government's estimate of $31,000,000.

The Chamber of Commerce of the United States has adopted resolutions directed against government ownership at Boulder Dam.

## "The New Competition" to Come Before N.E.M.A.

Charles F. Abbott, executive director of the American Institute of Steel Construction, will address the general meeting of the Supply Division of the National Electrical Manufacturers' Association on the afternoon of Tuesday, Jan. 24, on "The Third Industrial Revolution," giving experiences of the steel industry which may help the electrical industry to meet its own problems. H. T. Bussmann of the Bussmann Manufacturing Company will follow Mr. Abbott with an account of what the sales conference has accomplished and will also present a program of action for the Supply Division.

The grounding and distribution sections of the National Electrical Code will provide important topics at the convention, which will extend from Monday to Friday, and there will be full discussions on the development of markets. Study of "the new competition" will also form part of the proceedings.

A dinner meeting of section chairmen of the Supply Division, with D. Hayes Murphy presiding, will be held at 7:00 p.m. at the Hotel Commodore on Jan. 23. Gerard Swope, president of the N.E.M.A., and members of the board of governors will attend.

## Wired Radio, Inc., Applies for Wave Bands

Wired Radio, Inc., has applied to the Federal Radio Commission for permission to use short waves for broadcasting radio programs over light and power wires. The commission will take no action until after the hearing on short-wave allocations on Jan. 17. The request was for permission to use three frequencies in the band commencing with 1,500 kilocycles.

The North American Company bought the plans of General George O Squier several years ago and through its subsidiary, Wired Radio, Inc., has been developing the system for several years. The latest technical development permits of a single receiving set with three switches for use in the reception of any of three programs sent over central-station three-phase systems. As visualized in future development, programs will be made at a central location and will be transmitted by wire to the ultimate user. If the plan becomes popular, it may be that the way will be opened for charges to users of the equipment.

The application placed before the commission indicates the ripening of the wired-radio plan, and it is reported that several electrical groups are concerned in starting it on its career. The utilities are much interested because the sets will use considerable energy.

## Floodlighting the Quaker City Edison Building

An unusually fine example of floodlighting was given at Philadelphia on New Year's Eve, as described last week (Electrical World, page 70) when the Philadelphia Electric Company's new 23-story office building at Ninth and Sansom Streets was illuminated for the first time with moving light of many hues, said to be the only permanent installation of that kind yet made. In the installation 483 floodlamps are used, rated at from 500 cp. to 1,000 cp.

The installation was designed by Arthur A. Brainerd, assistant illuminating engineer of the company. He was the winner of a McGraw prize at the last N.E.L.A. convention. The Pittsburgh Reflector Company supplied 467 of the floodlamps three weeks after they were ordered. Two 18-in. floodlamps were supplied by the General Electric Company, fourteen prismatic inclosing units were furnished by the Holophane Glass Company, while the color caps and lenses were supplied by the Laco-Phillips Company. The electrical work was installed by the J. F. Buchanan Company of Philadelphia. The total load is 262 kw.

## Herminghaus Suit Ended

*Southern California Edison Company Acquires 17,500 Acres of Riparian Land Along the San Joaquin for Sum Put at $1,000,000*

BY A SETTLEMENT out of court of the suit brought against it by the Herminghaus estate, the progress of which has been followed in these columns, the Southern California Edison Company has acquired title to 17,500 acres of land bordering the San Joaquin River in Fresno and Madera Counties. The consideration was reported to be $1,000,000.

The property involves riparian rights to water in the San Joaquin River which the power corporation was restrained from impounding in its Florence Lake hydro-electric reservoir in the Sierras east of Fresno. Litigation over the Southern California Edison Company's condemnation suit against Mrs. Amelia Herminghaus and other heirs of the Herminghaus estate to obtain these rights had lasted three years.

## Governor Fuller Backs Massachusetts Commission

In his address to the Massachusetts Legislature at its opening session on Jan. 4, Governor Alvan T. Fuller came squarely to the support of the Department of Public Utilities in its resistance to all efforts to substitute for the department's present method of rate valuation one based on reproduction cost new less depreciation and indorsed the department's recommendations as outlined in the ELECTRICAL WORLD for Dec. 17 (page 1265), declaring the time to be ripe for the enactment of such legislation.

## Sales Conference Developing Industry Program

The Industry Sales Conference, composed of delegations representing the four major national associations and the League Council, held its second meeting on Wednesday in the board room of the National Electrical Manufacturers' Association, New York, to consider the recommendations of the committee that had been appointed to study the problems presented by the present inadequacy of house wiring.

The plans of the conference are taking the direction of a broad program that will combine a national movement of locally organized selling campaigns to merchandise the idea of adequacy in house wiring, these campaigns to enlist the co-operation of all local interests, the central-station companies assuming the responsibility for leadership, and utilizing the services of the leagues. This will entail national direction and regional field service and a consistent continuing program looking forward over a term of years, with highly organized selling of convenience outlets as its first major objective.

To carry forward such a movement will require the co-operation and support of the contracting industry. The conference is developing the possibilities of organizing a broad educational work among all contractors, to promote better standards of estimating, cost keeping and business methods similar to the work that has been so successfully done in the plumbing industry. In effect this would provide an expansion of the very effective service that the Association of Electragists has been performing for its members, but to embrace the entire personnel of the contracting industry, now working for the most part uninfluenced by any association. This subject is being well studied and programmed.

At the same time, careful consideration is being given to the needs for adopting the merchandising policies of the industry to such a movement, so that the installation of additional outlets in the home may be capitalized by the immediate sale of appliances. The reports of these functional committees were analyzed and finally referred to the executive committee of the conference as the basis for the full report and recommendations which will be presented this spring to the four national associations, now acting as a council of the industry in the directorate of the Society for Electrical Development.

## *A New Year's Epitome of "Electrical World" History*

The *Electrical World* (published under that name since 1883 and tracing its history back to 1874) is a consolidation of the *Electrical Engineer* (founded in 1882 as the *Electrician*) and the *American Electrician* (founded in 1896). Final consolidation under the title of *Electrical World* took effect on Jan. 1, 1906, the *Electrical World* and the *Electrical Engineer* having been acquired by the McGraw Publishing Company in 1899 and amalgamated as the *Electrical World and Engineer*, and the *American Electrician*, a McGraw monthly, having been absorbed seven years later.

The roster of past editors of the *Electrical World* includes Carl Hering, Louis Bell, W. D. Weaver, T. C. Martin and many other men prominent in the electrical industry—some, like those named, no longer living, and others, like C. O. Mailloux, A. S. McAllister, Frank F. Fowle, F. M. Feiker, D. H. Braymer and H. V. Bozell, still active in engineering and industrial service. William H. Onken, Jr., is now editor and L. W. W. Morrow managing editor. Other members of the present staff are: Earl Whitehorne, commercial editor; Allen M. Perry, associate editor; G. F. Wittig, statistical editor; H. M. Cameron, financial editor; F. C. Wells, news editor; Eustace C. Soares, manufacturing and markets editor; E. R. Searles and E. M. Glennon, assistant editors; F. R. Innes and T. P. Kindig, Western editors; H. S. Knowlton, New England editor; Walter C. Heston, Pacific Coast editor, and Paul Wooton, Washington correspondent.

## Ontario Hydro Defeated at "the Soo"

*Voters of Sault Ste. Marie, Ontario, Accept Plans of Great Lakes Power Company in Preference to Those of Provincial System*

THE Ontario Hydro-Electric Power Commission lost its fight for the development of power at Sault Ste. Marie, Ontario, in the municipal elections in that city on Jan. 2, when a majority of the voters accepted the Great Lakes Power Company's proposal to supply the power needs of the community. (See ELECTRICAL WORLD for Dec. 10, page 1219). One feature which entered into the contest in its closing hours was an announcement by the Algoma Steel Corporation that a win for the Hydro would destroy the labor of five years in negotiations for an extension of its industries entailing an expenditure of $12,000,000. The steel plant has arranged for power at a definite price, and it insisted that a victory for the Hydro would put the whole power question "up in the air."

The Algoma Power Company, which, like the Great Lakes Power Company, is a subsidiary of the Middle West Utilities Company of Chicago, will begin surveys at once on the Montreal River, 90 miles from "the Soo," where it is held that 25,000 hp. can be developed and transmitted.

## A.E.C. Steadfast Against Federal Ownership

Meeting in Washington from Monday to Wednesday inclusive of this week, the American Engineering Council went on record in opposition to the expenditure of federal funds for the Boulder Dam project, on the ground that it involves federal ownership and sale of power. The council therefore voted its disapproval of the Swing-Johnson bill. The bill of Senator McKellar to establish a Muscle Shoals commission was likewise disapproved by the meeting.

That the American Engineering Council is opposed to the principle of federal subsidy was also made clear in a discussion of the Tillman bill, which would advance government funds for the development of agriculture, home economics and industry. While agreeing unanimously that the engineering profession should support a sound federal program to assist agriculture, it was maintained that this form of assistance does not coincide with the engineering point of view.

Action of the council on legislative measures followed the recommendations of its public affairs committee, headed by A. W. Berresford of New York. Mr. Berresford, a notice of whom appears under "Men of the Industry," was elected to succeed Dean Kimball of Cornell University as head of the A.E.C. Sir Esme Howard, Ambassador from Great Britain to the United States, was the speaker at the banquet on Tuesday evening.

# "Electrical World's" London Letter

## Underground Cables Urged by Heterodox Engineer for England's Proposed Interconnected Network—Standardization, Lighting, New Installations, Commercial Progress, "Personals"

By Bernard C. Holding
*Editor of "The Electrician"*

London, Jan. 1, 1928.

ELECTRICALLY speaking, the last months of 1927 over here were full of items of interest, though it is difficult to point to any one of these as being of outstanding importance.

One interesting feature has been the reading of the inaugural addresses of the chairmen of the various sections of the Institution of Electrical Engineers. In these addresses many unorthodox viewpoints have become apparent, one of the sectional chairmen actually having the temerity to urge the merits of underground cables, as against overhead lines, for the extensive interconnected supply network that is proposed for this country. Committed, as we seem to be, to the overhead method, this voice cannot be regarded otherwise than one crying from the wilderness, even though the arguments adduced in favor of the underground method seem to have some merit.

Great activity is noticeable in the issue of British Standard Specifications for various types of electrical equipment. During November a revised specification was issued for bayonet lamp holders, the dimensions of which will now conform to the international standard laid down by the International Electrotechnical Commission in so far as interchangeability is concerned. Another new standard established is for reversible protected-type two-pin plugs and sockets with earthing connections.

### Interest in Lighting

As we have heard from one of our illuminating engineers who studied lighting conditions in such places as New York, Chicago, Detroit, Cleveland, Schenectady, Boston and Philadelphia, great attention is being paid to lighting service in your country. Similar interest is being aroused over here by the various lighting service bureaus which have been established in some of the large towns. The London bureau has recently been rearranged on new lines which permit the reproduction of both good and bad lighting in actual home, shop, school and factory surroundings. Great success is also attending the giving of lectures on home lighting to large audiences of housewives, schoolteachers, tradesmen and others.

In the field of public lighting it is becoming increasingly apparent that the whole of the lighting of thoroughfares in this country should be placed under the supervision of one central advisory body. With the continued growth of motor traffic, the part which suitable public lighting can play in accident prevention assumes ever-increasing importance, and this factor alone is sufficient reason for tackling public lighting problems on national lines.

On the electricity supply side of the industry, November has seen the inauguration of power-station extensions at the municipal undertakings of St. Pancras and Stoke-on-Trent, the former comprising a further 10,000/12,500-kw. Brush-Ljungström generating set. This station was the first in England to install plant of this type, having started up a 1,500-kw. set by the same makers in 1914. During the month one of the London company undertakings—the Charing Cross Electricity Supply Company, Ltd.—started up a new General Electric-Fraser & Chalmers oil-engine set comprising a 1,750-b.-hp. six-cylinder oil engine coupled to a 1,200-kw. direct-current generator. This is believed to be the largest stationary set of its kind yet built in Great Britain.

On the commercial development side of the supply industry elaborate electricity showrooms have been opened by the Battersea (London) Borough Council and by the Westminster Electric Supply Corporation, Ltd., which has announced a new tariff reducing the cost of energy for cooking and for "off-peak" water heating to the very low figure of ½d. per kilowatt-hour.

Other matters of interest during recent weeks included the unveiling of a memorial tablet to Michael Faraday in his native borough of Southwark, where the nucleus of a Faraday Memorial Collection of the best books on electricity and allied sciences has been formed; the Commercial Motor Exhibition, where six-wheeled electric trackless trolley buses, with double-deck, covered-top bodies, were seen, and the change-over to automatic working of a busy London telephone exchange.

Of personal interest is the appointment of Lieut.-Col. W. A. Vignoles, borough electrical engineer of Grimsby and a past-president of the Incorporated Municipal Electrical Association, as director and secretary of the British Electrical Development Association in the place of J. W. Beauchamp, who is retiring at the end of the year to become chief engineer of the South Wales Power Company. It may also be of interest to record that at the next general election Prime Minister Baldwin is to have as a Labor party opponent H. M. Gibson, a clerk in the Manchester Electricity Department.

# Mr. Insull Supplements His Reed Committee Testimony

The investigating committee which held hearings a year ago, under the chairmanship of Senator Reed of Missouri, to inquire into alleged irregularities in the 1926 senatorial elections in Pennsylvania and Illinois, resumed its sittings last week. This inquiry is of special interest to the electrical industry because it brought from Samuel Insull, president of the Commonwealth Edison Company, an admission that he had contributed very large sums to political campaigns, including that of Frank L. Smith, former chairman of the Illinois Commerce Commission, for United States Senator.

It may be remembered that Mr. Insull and his attorney, Daniel J. Schuyler, refused to disclose to whom $40,000 of the utility head's total contributions of $237,925 went on the ground that to do so would be a betrayal of confidence. Contempt proceedings were thereupon threatened by the committee. Last week, feeling released from the obligation of secrecy, Mr. Insull and Mr. Schuyler testified that half of the $40,000 went to Charles F. Francis, of the Small-Lundin faction in Cook County politics, and half to George F. Harding of the "Big Bill" Thompson group. Mr. Insull testified that he frequently borrowed various sums for campaign contributions from the Commonwealth Edison Company, placing an "I. O. U." in the drawer and eventually repaying the sums by check.

When Mr. Schuyler was on the witness stand Senator Reed sought to obtain admissions that in his view Mr. Insull contributed to campaign funds because his utility companies were involved in political controversy. Mr. Schuyler said that if he were in Mr. Insull's position with vast interests to protect he would desire to maintain friendly relations with public officials.

# Commission Asks for Data on Political Expenditures

Cognizance of public agitation concerning contributions by utility companies or their officials to political campaigns has been taken by the California Railroad Commission, which on Jan. 3 adopted the following resolution, addressed to the various utilities under its jurisdiction:

> Resolved, That by order of the Railroad Commission you are required to supplement your 1927 annual report with a statement showing the amount of money, if any, expended by you for political purposes, the accounts to which such expenditures were charged and the purposes for which such expenditures were incurred or made.
>
> By "expenditures for political purposes" is meant such expenditures, including allocations of compensation of executives, officers and employees for time devoted to political purposes, as are incurred or made to elect or defeat a candidate for public office, or to support or defeat any measure on the ballot, or to place any measure on the ballot, or to keep it from being placed on the ballot at any state, county, municipal or other election during the year.
>
> Such statement shall be submitted by the president or general manager of the company under oath, which oath shall show that he knows the facts contained in the statement to be true and correct of his own knowledge. Such affidavit should also show that no expenses for political purposes have been incurred which are not included in the statement.

## Purchases and Mergers

### *Niagara, Lockport & Ontario Company Starts Operation as New Consolidation—Central Maine Power Company Authorized to Buy Four Others*

IDENTITIES of the former Niagara, Lockport & Ontario Power Company and the Western New York Utilities Company were merged on Jan. 1 in the new Niagara, Lockport & Ontario Power Company, with headquarters in Batavia, N. Y. The Western New York Utilities Company became one of the Buffalo, Niagara & Eastern group last spring, and petition for its consolidation with the Niagara, Lockport & Ontario was filed in the fall. It had had its headquarters in Batavia and branch offices in Albion, Medina and Brockport. The old Niagara, Lockport & Ontario Power Company had headquarters in Buffalo.

Authority has been given to the Central Maine Power Company by the Public Utilities Commission of Maine to issue bonds and stock for the purchase of the Western Maine Power Company for $1,057,437, the Fryeburg Electric Light Company for $27,301, the Bethel Light Company for $36,403 and the Black Stream Electric Company for $51,000. These purchases total $1,172,141 and other moneys will be expended for betterments.

The Harlem Valley Electric Corporation, Chatham, N. Y., has filed a certificate in the office of the Secretary of State merging with it the Chatham Electric Light, Heat & Power Company. The Public Service Commission has approved the transfer by Harlan E. Ralph of an electric distributing system in Belleville, Ellisburg and Henderson, Jefferson County, to the Woodville (N. Y.) Electric Light & Power Company for $8,000.

The Mohawk-Hudson Power Corporations has received permission from the New York Public Service Commission to acquire the stock of the Schodack Light & Power Corporation, which supplies electricity in Castleton and immediate vicinity. The Schodack company has been buying its electricity. The New York Power & Light Company has made application to the Public Service Commission for permission to merge with it the Blue Hill Light & Power Company of Livingston, Columbia County.

It is planned to sell the rights and lines on Indian River, in the southwest portion of St. Lawrence County, N. Y., owned by the Rossie Electric Company, to the Oswegatchie Light & Power Company. The Rossie company's rights are in the main undeveloped.

The City Council of Hooker, Okla., has sold the municipal light and power plant to the Inland Utilities Company of Kansas City for $30,000, subject to approval of the voters. Citizens of Locust Grove, Okla., have voted to sell their distribution system and municipally owned transmission line to the Public Service Company of Oklahoma, to which a franchise has been granted.

Purchase of the electric light and power plant at West Fork, Ark., has been announced by the Southwest Power Company. The purchase price was not made public.

The Carolina Power & Light Company, Raleigh, N. C., has taken over the South Carolina Power & Light Company, with headquarters at Kingstree, S. C., serving the interconnected towns of Kingstree, Manning, Lake City, Andrews, Lanes, Greeleyville and Scranton.

The village of Sargent, Neb., has called a special election for Jan. 24 to pass on the question of selling the municipal plant to the Nebraska Electric Power Company for $17,500.

The Indiana Public Service Commission has authorized the purchase by the Interstate Public Service Company of the Holton Electric & Power Company for $15,400.

Acquisition by the Washington Water Power Company, Spokane, of the plant and system of the Calispel Light & Power Company on Jan. 1 added the towns of Dalkena, Usk and Cusick, Wash., to the first-named system. The company recently purchased also the Lacrosse (Wash.) Electric Company and the Greenacres Power & Light Company, as well as the Potlach Consolidated Company in Idaho, these systems having distribution systems only.

Prentiss, Miss., has received bids from power companies for the sale of its municipal plant and is considering them.

The Alma (Ga.) lighting plant has been taken over by the Southeast Georgia Power Company.

Control of the Union Power Company's plant at Drumhellar, Alberta, Canada, has been acquired by the International Utilities Corporation, and it is the intention of the new owners to make Drumhellar the center of distribution for electric power over a wide area where coal mines abound.

## Attack Authority of Tennessee Commission Over Streams

Charging that the Railroad and Public Utilities Commission of Tennessee has no authority in law for the powers it attempts to exercise in control and regulation of water-power development upon the streams of the state, suit has just been filed in the Nashville Chancery Court by the Tennessee Eastern Electric Company against the commission, praying the court to construe the legal powers of the commission, and likewise to declare the rights of the owners of water-power sites. Pending the determination of these issues, the court is asked to enjoin the commission from granting any permit on a designated power site on the Holston River which the petitioning company has planned to develop.

Because of the rapid growth of its territory, says the petition, the company began several years ago to acquire title to lands along the Holston River for the purpose of building a large hydroelectric plant, and it has now expended about $500,000 for this purpose and acquired 2,500 acres of land for a dam site. Assumption last fall by the commission of authority over state water power, the company asserts, prevented further progress on the development and confused in the minds of the public the entire question of the right on the part of the owner of riparian rights to proceed with the development of water power of any character, and particularly where such development pertains to non-navigable streams. Determination of this case may have a marked effect upon the development of the water-power resources of Tennessee and perhaps of other states.

## Briefer News

THIRTY-NINE MILLIONS TO BE SPENT BY MICHIGAN ELECTRIC UTILITIES THIS YEAR.—Michigan electric utility companies will spend about $39,000,000 in the coming year in extending and improving service, according to the Public Utility Information Bureau of that state. The added facilities will make it possible to take on 50,000 more customers. Farm service is to be pushed.

WATER-POWER PROJECT FOR TRINITY COUNTY, CAL.—Preliminary plans for a power plant on streams in Trinity County, Cal., have been filed at Sacramento with an application for water rights from George E. Waggoner, Stockton, and Robert L. Little, Los Angeles. The applicants seek to divert 100 cu.in. from Stony and Deer Creeks and Stuart's Fork, producing approximately 20,000 hp. The water will be used to supplement other grants for the plant, which is to be situated near Weaverville. An eventual outlay of $5,000,000 is said to be entailed.

LIGHTING COURSE FOR CONTRACTORS.—A course in illumination for electrical contractors will be launched on Jan. 17 under the auspices of the lighting committee of the Metropolitan New York Section of the National Electric Light Association. The course will consist of five lectures, each complete with demonstrations, to be given at 8 p.m. on Tuesday evenings for five weeks in the Electric Building in Long Island City. Later, similar courses will be given in the other boroughs of the city. On Jan. 1 the registration for the course was 65, and it is expected the total enrollment will exceed 75. Lecturers will represent the Edison Lamp Works, Harrison, N. J.; the Westinghouse Lamp Company, Bloomfield, N. J.; the Graybar Electric Company, the United Electric Light & Power Company and the New York Edison Company.

RAILROAD ELECTRIFICATION TO BE A TOPIC AT MICHIGAN ENGINEERING CONFERENCE.—"The Electrification of Steam Railroads in the United States" will be discussed by W. M. Vandersluis, electrical engineer Illinois Central Railroad, at the afternoon session of the Michigan Engineering Conference at the Hotel Statler, Detroit, on Friday, Jan. 27, over which Alex Dow will preside and which will be addressed also by John Lyle Harrington on "The Part of the Engineer in Enterprises Based on Engineering." A. L. Powell will speak on "Science with Art in Lighting" at the evening banquet, over which H. H. Higbie, past-president Illuminating Engineering Society, will preside. The talk by Mr. Powell, who is the manager of the engineering department of the Edison Lamp Works at Harrison, N. J., will be illustrated. On Saturday Prof. Comfort A. Adams will speak on welding, C. F. Hirshfeld of the Detroit Edison Company on "Two Blades Where But One Grew Before," and Prof. George L. Clark of the University of Illinois on "X-Rays as an Engineering Tool."

Conowingo Condemnation Rights Upheld. — By declining to hear argument for the defense the United States Supreme Court last week indicated that it would dismiss the appeal of James C. Colgate from the decision of the Pennsylvania courts, already noted in these columns, upholding the right of the Philadelphia Electric Company to condemn land in Pennsylvania for a transmission right-of-way from its Conowingo development. The plaintiff held such condemnation to be illegal because the power plant itself was in another state.

Flathead Lake Agreement at Power Commission Hearing.—Agreement to raise the level of Flathead Lake to 2,893 ft., an altitude said to be satisfactory both to local residents and to promoters of the Columbia Basin project, was reached at a Federal Power Commission hearing held by Major John Butler in Polson, Mont., and continued in Kalispell, Mont., late in December. Application of the Rocky Mountain Power Company for a large development at the foot of the lake is expected to be granted on the filing of an amended application reducing the altitude from 2,902 ft.

Lower Rates in South Georgia Sought by State Commission.—The Georgia Public Service Commission has required the Georgia Power & Light Company, operating in a number of south Georgia cities, to show cause why it should not reduce both light and power rates in all of the communities that it serves. The company, which is a subsidiary of the National Public Service Company, a former Fitkin property, now under Insull control, obtains part of its power from Florida, and it is the opinion of the commission, according to Chairman James A. Perry, that this fact ought to enable the company to reduce its charges. Cities and towns affected by the order include Bainbridge and Waycross.

Houston Lighting & Power Budget. —A sum of $6,242,804 is to be spent on improvements during 1928 by the Houston Lighting & Power Company. This figure is approximately $500,000 in excess of the amount expended on improvements by the company during 1927. The program will bring the lighting and power facilities of Houston to a standard considerably above the present demands of the city, officials of the company say. The improvement program calls for expenditures as follows: New substations and improvements to existing substations, $363,841; substation and transmission transformers, $127,000; communication, $98,000; improvements of distribution system, $352,779; improvements of transmission system, $195,089; improvements of substation feeders, $401,000; improvements of power stations, $254,845; new turbines for Deepwater plant on the Houston Ship Channel, $3,000,000; improvements and extensions to underground system, $255,000; stores and shop buildings, $406,500; new meters, $140,000; new transformers, $140,000; short line extensions, $200,000; street-lighting equipment, $75,000; miscellaneous improvements, $233,750.

Receivership Sought by Spartanburg Company as Step to Readjustment.—The South Carolina Gas & Electric Company of Spartanburg, S. C., which was bought last fall by the Southern Public Utilities Company of Charlotte, N. C., controlled by the Duke Power interests, is defendant in an action instituted in the United States District Court by the Merchants & Farmers' Bank of Spartanburg as trustee asking appointment of a receiver. The action is taken as a new step in the direction of a financing plan to prevent the company from being operated at a loss of $100,000 per annum, owing in large measure to interest charges fixed by outstanding bonds and other forms of indebtedness. It is expected that the Southern Public Utilities Company will find in the action brought by the bank an opportunity to have the whole problem involving Spartanburg's utilities adjusted on terms that will allow them to go forward with a progressive program.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for January 7, page 80.]

Electrical League Conference — 30 North Dearborn Street, Chicago, Jan. 16 and 17. Society of Electrical Development, 420 Lexington Avenue, New York.

New England Electrical Credit Association—Boston, Jan. 17. C. A. Kane, 176 Federal St., Boston.

N.E.L.A. Commercial Section—Edgewater Beach Hotel, Chicago, Jan. 18-20. A. J. Marshall, 420 Lexington Avenue, New York.

National Electrical Manufacturers' Association — Supply Division, Hotel Commodore, New York, Jan. 23-27. S. N. Clarkson, 420 Lexington Ave., New York.

New England Central Station Association of Power Engineers—Chamber of Commerce, Boston, Jan. 25. T. D. Bond, C. H. Tenney & Co., Boston.

Artistic Lighting Equipment Association—Winton Hotel, Cleveland, Jan. 25-28. G. P. Rogers, 711 Graybar Bldg., New York.

Northwest Association of Electrical Inspectors—Olympic Hotel, Seattle, Jan. 26-28. F. D. Weber, 414 Lumbermen's Building, Portland, Ore.

Iowa Section, N.E.L.A.—Roosevelt Hotel, Cedar Rapids, Feb. 2 and 3. H. E. Weeks, Davenport, Iowa.

American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16. F. L. Hutchinson, 33 West 39th St., New York.

Rocky Mountain Division, N.E.L.A.—Albuquerque, N. M., Feb. 14-16. O. A. Weller, 900 15th St., Denver.

Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.

Iowa Power Conference—University of Iowa, Iowa City, Feb. 15 and 16. Joe Carmichael, Iowa Committee on Public Utility Information, 310 Crocker Bldg., Des Moines.

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21. J. C. Plankington, Northwestern Electric Company, Portland, Ore.

High Voltage for New Wilmington-Atlantic City Line.—According to C. H. Howell, general manager Atlantic City Electric Company, plans for the steam-electric plant to be built on the Delaware River opposite Wilmington, Del., jointly by the American Gas & Electric Company and the American Electric Power Corporation, as reported in the Electrical World for Dec. 17 (page 1263), include a 232-kv. transmission line to be built from Churchtown, near Pennsville, N. J., the site of the plant, on Deepwater Canal, to Atlantic City. The plant, which is eventually to have a capacity of 400,000 kw. and may cost $13,000,000, will serve parts of Atlantic, Cape May, Ocean, Cumberland, Gloucester and Salem Counties in New Jersey as well as the territory of the Delaware Electric Power Company. Cost of the transmission line is put at $1,000,000.

International Agreement on Development of Kootenai Expected in Year.—Delay of one year at the request of Secretary of State Kellogg, during which time a satisfactory plan for reclamation and power uses of the Kootenai River is expected to be reached, was announced at a hearing in Nelson, British Columbia, held late in December, at which the Canadian and American governments and private interests were represented. Flood protection for northern Idaho farmers, a reclamation project at Creston, just over the intenational line, and a reservoir and dam to develop 35,000 hp. for the West Kootenai Power & Light Company is in prospect. Three former United States senators, sitting as American members of the joint commission on boundary waters, asserted that they were satisfied a conspicuous example of co-operation between nations and for both agricultural and power development would result from the long-litigated situation on the Kootenai River and lake.

Notes From Ohio.—The Defiance City Council has passed an ordinance for the erection of a municipal lighting plant to cost $405,000. Defiance is served by the Toledo Edison Company. ——The Dayton Power & Light Company, which is building a second line to Washington Court House from its Dayton plant, has about half of the poles set and will dismantle, move and reassemble 190 steel towers now in use along the Bowersville Road. The line will not be completed until July.——A second reduction in rates within a period of two months for electrical energy furnished by the Wooster Electric Company is announced. The company's first cut was voluntary. The new one was perhaps hastened by an application for a 25-year franchise made by the Western Reserve Power & Light Company. Company officials say it would have been made a little later on in any event.

ARKANSAS POWER & LIGHT BEGINS 110-KV., 47-MILE TRANSMISSION LINE.—The Arkansas Power & Light Company began on Jan. 3 to build the 110-kv. power line that is to extend from the Woodward substation at Pine Bluff to the Dixie substation in North Little Rock, a distance of 47 miles. At the same time the work of enlarging the Woodward and Dixie substations was started. At North Little Rock several transformers will be installed, and the Woodward station will be rebuilt of steel. It is hoped to have the work completed by March 15. This is the first of several expansion projects to be undertaken by the company in Arkansas this year.

BRITISH COLUMBIA UTILITY COMPANY REDUCES RATES.—For the sixth time since 1917 domestic lighting rates will be reduced by the British Columbia Electric Railway Company in Vancouver on January 1. The new rates will be 4 cents a kilowatt-hour on the first step and 2 cents on the second. Corresponding reductions will be made in suburban areas and in commercial rates. In the city of Victoria rates will go down from 7 cents to 6 cents a kilowatt-hour, with the abolition of the meter charge but the inauguration of a minimum charge of $1 a month. The reductions are estimated to mean a saving to the public of $325,000 a year.

NEW ENGLAND POWER COMPANY CONSTRUCTION.—The largest single item in construction expenditures listed by the New England Power Company with the Massachusetts Department of Public Utilities is that of transmission lines, on which the company between Aug. 1, 1926, and Oct. 31, 1927, expended $894,520. To bring the new transmission-line construction to completion another $113,480 will be required. The next largest item is for transforming and switching stations, for which the ultimate cost is figured at $618,756, of which $590,734 has been expended. The company has under way a 110,000-volt steel-tower line between Bellows Falls, Vt., and Pratt Junction, Mass., cost of which is estimated at $650,000, and another line of similar voltage between Ayer and Tewksbury, Mass., which is expected to cost $344,430, besides a substation to cost about $475,800 under way at Pratt's Junction.

DOWNTOWN INDIANAPOLIS TO HAVE ALTERNATING CURRENT.—Installation of an alternating-current system for the downtown business district of Indianapolis will be the principal improvement undertaken by the Indianapolis Power & Light Company this year, according to President Norman A. Perry. Company officials will also direct their attention to the further consolidation of distribution lines throughout the city, a work that has been in progress since early in 1927. The new downtown system will be installed gradually and the buildings of the future will be supplied from it. A substation will be built in the southeastern part of Indianapolis and one of the company's existing downtown substations will be moved to a better location. The company is changing over its fleet of trucks to electric vehicles since this form of transportation is proving economical for a large percentage of truck work.

EXPANSION OF OKLAHOMA GAS & ELECTRIC'S HORSESHOE LAKE STATION.—The equipment which is now being added to the electric generating station of the Oklahoma Gas & Electric Company at Harrah will give a capacity of 87,500 hp. A 40,000-hp. turbo-generator is being added with two boilers which will burn powdered fuel. A heavy transmission line has been completed between the Horseshoe Lake station and the Riverbank station at Muskogee, the final link between Sapulpa and Drumright being now ready. The company also announces that interchange of power with the Public Service Company of Oklahoma is made possible by a line recently finished between the Seminole oil field and the Public Service lines west of Weleetka. The company is constructing a short 13,000-volt transmission line to connect its system with a 5,000-kw. steam plant being built 3 miles west of Howe by David Reed of Fort Smith, Ark., partly to furnish power to coal mines in the vicinity.

## Commission Rulings

CONSUMPTION CHARGES FOR ELECTRIC REFRIGERATOR.—The Illinois Commerce Commission has sustained the complaint of a consumer against the rates of the Illinois Northern Utilities Company for energy supplied to a refrigerator. The complainant contended that it was inequitable to attach a motor-driven device to the light circuit and that it should be attached to a heating circuit, since, the contention went on, the mechanical refrigerator is more nearly an off-peak consumer than ordinary domestic heating and cooking devices. The commission, in ordering a reduction of the refrigerator rates to place them on an equality with heating rates, agreed, saying that the refrigeration load factor is better by reason of the more continuous use of energy and that there was nothing in this record to show that the energy consumed by an electric refrigerator should be charged for at a higher rate than energy consumed by the ordinary domestic heating and cooking devices.

LEASE OF WATER RIGHTS IN CONSIDERATION OF CONTRACT AS FACTOR IN VALUATION.—In adjusting the valuation of the West Coast Power Company, the Washington Department of Public Works made several decisions. One of these, relating to the exclusion of unused standby equipment, was noted in the ELECTRICAL WORLD for Oct. 15 (page 808). In addition, the commission decided that the value of water rights leased to another company as part of the consideration for a contract under which power is purchased at reduced rates might be included in the rate base at a figure determined by giving proper consideration to the net savings under the contract and a proper distribution of such savings between the utility and its customers. No separate figure should be allowed, the commission held, for going value when the values already assigned to the various units of property are not those of a bare plant but those of a going concern and the pioneer losses have already been adequately covered in the operating expenses. A return in excess of 14.05 per cent was found to be unfair and unwarranted, and a decrease in rates was ordered so that rates would yield a return of 8 per cent.

## Recent Court Decisions

DE FOREST RADIO PATENTS AGAIN SUSTAINED.—Another step in the long contest over radio patents was taken last week when the United States Court at Wilmington, Del., handed down an opinion dismissing the suit of the General Electric Company against the De Forest Radio Company in which it was sought to restrain the De Forest company from making and using radio apparatus on the ground that four basic patents were infringed, covering electrical discharge apparatus and the process of manufacture and use of vacuum tubes. The court decided that the first and main patent of the four is invalid in view of prior art and because it lacked patentable novelty and for other reasons. The court held that only the third patent, covering the use of potassium in radio tubes, was valid.

DAMAGES FOR INJURY TO PROPERTY CAUSED BY NOISE FROM SUBSTATION REFUSED.—In Brady vs. City of Tacoma suit was brought by a householder whose property faces a municipal substation where 110-kv. current is stepped down upon the theory that there had been a taking or damaging of the property without compensation in that it was depreciated in market value and rendered less valuable for use by the unsightliness of the substation, the continuous noise attending its operation and the potential damage to adjacent residents by injury or death from fallen wires or other cause incident to the operations. The substation was admittedly properly built and equipped. The trial court held that there could be no recovery on account of the first and last causes, but found that the plaintiffs were damaged to the extent of $400 by reason of the continuous noise. On appeal by both parties, the Washington Supreme Court reversed the judgment against the city, holding that sounds of commercial and industrial activity must be material, substantial and unreasonable to warrant recovery of damages to adjoining property and that the electric substation was not improperly located so as to authorize recovery of damages to nearby residential property by continuous humming noise. (259 Pac. 1089.)*

# News About Men of the Industry

## *A. H. Manwaring Retires After 46 Years*

**Albert H. Manwaring**, engineer of transmission and distribution of the Philadelphia Electric Company, retired Jan. 1 after forty-six years of continuous and active service. It was in August, 1879, that he entered the employ of the Brush Electric Company, Cleveland, manufacturer of carbon lamps and arc lights and electric light plants, the pioneer electric lighting system in this country. In August, 1881, he became affiliated with the Brush Electric Company of Philadelphia as transmission and distribution engineer, which position he held with the Philadelphia Electric Company until his voluntary retirement.

A. H. MANWARING

Mr. Manwaring is the inventor of the broad carbon lamp, the tower wagon, electrically operated for trimming arc lamps, the electrically driven pole truck and the cable plow for installing underground cable. In 1892, he organized the Philadelphia Electrical & Manufacturing Company, of which he is president. He is a member of the American Institute of Electrical Engineers, the Illuminating Engineering Society, the Franklin Institute and other associations.

**James E. Lannigan**, vice-president of the Whitaker & Bogardus Realty Company, has resigned to become assistant manager of the Fulton Light, Heat & Power Company of Fulton, N. Y.

**Robert J. Moran** has been appointed assistant chief of the electrical department of the Philadelphia Fire Underwriters' Association.

**Leonard H. Church**, for the last year and a half affiliated with the editorial staff of Electrical World, first in New York and more recently in Cleveland, is now editorial representative of the *Electric Railway Journal* in Chicago, with the title of assistant editor. For three years previous to assuming editorial duties in New York, Mr. Church was a member of the faculty of the electrical engineering department of the Kansas State Agricultural College, Manhattan, Kan. In addition to his academic work, while in the Middle West Mr. Church served as a consulting engineer in the Red Wing rural project in Minnesota and specialized in rural electrification in Kansas.

## *A. W. Berresford Heads Engineering Council*

A. W. Berresford, for many years prominently identified with the manufacturing branch of the electrical industry was elected president of the American Engineering Council at a meeting held this week in Washington, D. C. The selection of Mr. Berresford places at the head of the council an engineer-executive possessing a wide knowledge of general engineering and a broad background of actual experience in industrial enterprises.

For 22 years Mr. Berresford was identified with the Cutler-Hammer Manufacturing Company, having served in the capacity of vice-president and general manager for a period of almost twenty years. He resigned from this executive position in 1923, and, three years later, became executive vice-president of the Nizer Corporation, following the consolidation of that organization with the Kelvinator Corporation and the Grand Rapids Refrigerator Corporation, operating as divisions of the Electric Refrigeration Corporation. He severed his connection with the refrigeration branch of the industry last summer. In association work Mr. Berresford has been extremely active, being a past president of the American Institute of Electrical Engineers, the Electrical Manufacturers Club and of the Associated Manufacturers of Electrical Supplies.

A. W. BERRESFORD

## *P. H. Chase Succeeds Manwaring in Philadelphia*

**Philip H. Chase**, formerly assistant engineer of transmission and distribution of the Philadelphia Electric Company, has been appointed transmission and distribution engineer of the company to succeed A. H. Manwaring, who recently retired. Mr. Chase's first affiliation with the electrical industry was as an employee of the Public Service Electric Company of Newark, N. J., where he spent seven years as assistant to the superintendent of distribution, supervising distribution and substation operation, and, subsequently, as assistant engineer on electrical station and substation design and construction. In 1917, he became chief electrical engineer in general charge of electrical work on the various properties of the American Railways Company of Philadelphia, now the American Electric Power Corporation. It was in 1921 that he joined the Philadelphia Electric Company.

P. H. CHASE

A native of Hanover, N. H., Mr. Chase received his technical education at the Massachusetts Institute of Technology and at Harvard University. In the course of his engineering career, he has been active in association work, having been at various times president of the Pennsylvania Electric Association, chairman of the technical section and chairman of the overhead systems committee. He has also done extensive work on committees of the American Institute of Electrical Engineers, the Illuminating Engineering Society and the National Electric Light Association.

**Gerard Swope**, president of the General Electric Company, sailed for Europe Jan. 7 aboard the Cunard liner Aquitania to spend a short time abroad.

**Thomas A. Edison** left his home at West Orange, N. J., Jan. 12 to spend the winter at his home in Fort Myers, Fla.

# Financial and Statistical News

## *Call Money Movements*
## *Common Stocks at New High*
## *Bonds Active and Firm*

UNAFFECTED by the rise of call money to a point higher than at any time during 1927, power and light stocks made advances over 1927 high levels, during the first week of the new year. Since that time, the call rate has returned to normal, but, at the same time, utility stocks have receded slightly in accordance with the general trend of the market. The average price of fifteen representative power and light stocks is now 121, against 91 for the corresponding week last year.

Bond prices have also continued to rise, and demand for high-grade issues is very strong. The average price of nine representative power and light bonds, as computed by the ELECTRICAL WORLD is now 105 against 98 this week last year. The last calendar year showed an advance of more than 7 points in this group, and financial men in the industry state that they anticipate no change in this trend. Such a view is supported by a comparison of yields with those on railroad bonds, for example, especially as the investing public is beginning to appreciate the relative merits of power and light company bonds as compared, yield for yield, with those of some other industries.

## New England Power to Issue New Stock

The New England Power Company has petitioned the Massachusetts Department of Public Utilities for authority to issue 68,000 additional shares of common stock at a par value of $25 per share to meet the cost of plant additions. Including common stock of the par value of $5,100,000 previously petitioned for, the total par value of the company's securities will be $36,037,000, if the board acts favorably. These securities will consist of $17,000,000 in common stock and $6,814,000 in preferred, both par values, and $2,223,000 in first mortgage bonds, face value. The improvements to which the proceeds of the 68,000 shares are to be applied approximate $1,700,000.

## Saluda Dam Project Calls For $17,000,000

Financial plans for the construction of the Saluda Dam, one of the largest hydro-electric projects in the United States, have just been arranged by the Lexington Water Power Company, a subsidiary of General Gas & Electric Corporation. The plan comprises two issues, a $12,000,000 issue of first mortgage 5 per cent, 40-year bonds, and a $5,000,000 issue of 5½ per cent convertible debentures. The former are sold at 98 and interest, and the latter at 98½ and interest.

Great interest has been focussed upon this huge development. The dam to be constructed will have the largest cubical content of any dam in the country and the lake will be the largest artificially created in the country. The capacity of the power house, from the standpoint of average firm kilowatt-hour output, will be exceeded by only one hydro-electric generating station in America, that of the Niagara Falls Power Company. The cost of the development is expected to be approximately $21,000,000.

Provision for the disposal of the huge amount of power which will be available has already been made. Contracts extending until 1980 have been consummated with Carolina Power & Light Company, Duke Power Company and Broad River Power Company.

The debentures will be convertible into $6 cumulative preferred no par stock of the company, after January, 1931, on the basis of 10 shares of such preferred stock for each $1,000 principal amount of debentures, with adjustment for accrued dividends and interest.

## Philadelphia Consolidation Involves Expanding Activities

### Greater Opportunities and Increasing Demand for Power Will Result in an Increase in the Operating Staffs Rather Than a Reduction

THE probable policy of the dominating company following a merger or absorption is always the occasion of much speculation. In the case of the United Gas Improvement—Philadelphia Electric situation, President Arthur W. Thompson has given out some idea of prospects and economies to be effected. Following are statements from his recent address before the Philadelphia Electric Company section of the National Electric Light Association.

References have been made in the newspapers to economies which might result from this consolidation of interests in Philadelphia. It is not necessary to refer to how this will be brought about to most, if not all of you in the industry. Briefly, when one realizes that, with the Conowingo power brought into the joint territory of these companies, with the coupling up of transmission and distribution lines, with the closing down of many power plants and using them only for peak load purposes, it is then one realizes the economies that can be made.

These references have not been made with the idea of reducing the forces of the Philadelphia Electric Company, or through having The U.G.I. do the work; on the contrary, through the consolidation of the interests, through expansion and development of the territory, will the greatest results be obtained. The U.G.I. proposes to stand by with its efficient personnel, who are engaged in public utility work over a wide area, and who have a wide range of activities, to help the Philadelphia Electric organization wherever possible.

There are opportunities for big steam plants on the Delaware River, and the immense Conowingo development of hydro-electric, through the generation, transmission and distribution of power will be unrivaled, except in some few local places where hydro-electric can carry all of the load.

Philadelphia metropolitan area comprises a territory of approximately 2,000 sq.mi. The present community of interests of the Philadelphia Electric and the U.G.I. opens up a new field of activity for each and every one of you, through the very linking of these properties together. Elimination of waste benefits the consumer, patron or investor and brings opportunity for advancement and promotion to all of you, with prospects for greater compensation.

Of course, if I could not come before you with optimism, with encouragement, I should not be here. This great city or metropolitan area is third in size in the United States and one of the greatest communities of diversified industries in the United States. Power has and will continue to encourage development of this diversified industry and the small industrial plant. When it is known and fully realized that the Philadelphia Electric Company power rates on file with the Public Service Commission of this State gives to the power consumer a rate lower than any other city in the United States except Buffalo, there will be more rapid industrial development here.

More employees, more promotions, more executive positions will be necessary to meet the demand for electric service and, as I have announced previously, the policy of the U.G.I. is to continue not only the charter and the corporate company of the Philadelphia Electric, but to supplement it and bring the various properties together to make these economies. All of which should be and is, no doubt, an incentive to do good work on the part of all of you.

## American Water Works Declares Common Extra

The directors of the American Water Works & Electric Company declared a quarterly dividend of 25c. on the common stock and a semi-annual dividend of one-fortieth of a share of common stock on the common stock. Both dividends are payable February 15 to stockholders of record February 1. Previously the company had been paying 2c. quarterly in cash and semi-annual stock dividends of 2½ per cent. The net power output of the electric subsidaries of the American Water Works & Electric Co., Inc., to consumers for the month of November was 138,634,345 kilowatt-hours, compared with 135,721,509 kilowatt hours for the month of November, 1926, a gain of 2 per cent. For the first eleven months of 1927 net power output totaled 1,507,278,844 kilowatt-hours, against 1,348,312,188 kilowatt-hours, a gain of 12 per cent.

## Stockholders Approve Combination

Stockholders of the companies involved in the proposed merger with the Public Service Electric & Gas Company voted in favor of consolidation as follows:

In the case of Public Service Electric & Gas Company 11,997,521 shares were voted for and none against; 48,876 shares of Essex & Hudson Gas Company were voted in favor and 7,861 against; 81,589 shares Paterson & Passaic Gas & Electric Company for, 5,967 against; 3,082 shares New Brunswick Light, Heat & Power Company for, none against; 8,123 shares Somerset, Union & Middlesex Lighting Company for, 1,277 against.

## Tennessee Electric Will Resume Stock Sale

In conjunction with the Tennessee Electric Power Company's construction program of the new year, involving expenditures of approximately $5,000,000, the company announced the resumption of the sale of its first preferred shares to the people of Tennessee. The price is $100 per share, paying $6 a year dividends, to yield a return of 6 per cent. The company's expansive building and development program and stock sales activities go hand in hand. In the last four years, Tennessee Electric Power's construction expenditures have equalled or exceeded $5,000,000 a year and in this period about $8,500,000 of the company's securities have been purchased by investors in Tennessee. Demand for Tennessee Electric Power preferred shares has been increasing year after year, so much so, in fact, that, in 1927, the company's portion of new capital through stock was placed with investors in the first six months of the year. This necessitated a cessation of the customer-ownership securities' program for the remainder of the year, resulting in numerous inquiries as to the reasons therefor. The present 6 per cent issue has enjoyed a steady increase in price since its offering less than two years ago, superseding a 7.20 per cent issue in effect prior to that. The 6 per cent stock first sold for $90 per share, then $92.50, $95, $97 and now $100. It may be purchased at $100 cash or on a time payment basis of $10 per share, each deposit earning interest at the rate of 6 per cent per annum, when the stock is fully paid for.

## Power and Light Maturities Exceed $86,000,000 for 1928

OWING to extensive refunding operations in the public utility field during the last year, bond and note maturities for 1928 have fallen off from $280,413,000 in 1927 to $208,768,000 in the calendar year 1928. Contrary to expectation, however, the power and light total has advanced from $56,042,000 in 1927 to $86,411,000 in 1928, being 41 per cent of the total for all public utilities this year, according to Dow, Jones & Company.

Such an increase, however, is not sufficient to be of any special significance. Refunding in the power and light industry has been carried out on a very extensive scale during the last year, a total of $879,000,000 out of aggregate financing for all purposes, of $2,128,909,000 being for refunding purposes. Such operations have brought about a huge saving in interest charges, possibly $15,000,000 yearly, and they have also helped to simplify and strengthen capital structures as well. The total retirement of $86,000,000 in these issues in 1928 will add materially to this reduction in fixed charges.

Out of the issues maturing in 1928 in the power and light industry, at least four bear 7 per cent interest rates, and the majority are 6 per cent. Interest charges to the extent of probably $5,000,000 are wiped out, disregarding the question as to whether or not these issues are replaced by new offerings. Maturities for 1928 by main classes are:

| | |
|---|---|
| Industrials .......... | $244,116,830 |
| Pub. Railroad issues.. | 292,156,390 |
| Foreign Govt. issues.. | 144,883,240 |
| Public Utilities...... | 208,768,720 |
| | $889,925,180 |

## American Gas Plans Stock Increase

A proposal to increase the number of shares of no par common stock of the American Gas & Electric Company from 2,250,000 to 4,000,000 shares will be submitted to the stockholders of that company at the annual meeting to be held Feb. 21. At the annual meeting held last year the common stock of the company was changed from $50 par value to no par value at the rate of five new shares for one old share of stock. If the proposed plan meets with the approval of the stockholders the financial set-up of the American Gas & Electric Company will consist of 4,000,000 shares of no par common stock, 600,000 shares of $6 cumulative preferred stock, $6,282,000 of 5 per cent collateral trust bonds and $46,904,000 of 6 per cent debenture bonds.

## Five Utility Offerings

During the second week of January, four electric light and power companies offered new securities to the amount of $26,700,000.

The Lexington Water Power Company floated two loans, one in the form of first mortgage bonds, amounting to $12,000,000, the other in the form of convertible debentures amounting to $5,000,000. The bonds were priced at 98 and interest and the debentures at 95½ and interest.

The National Electric Power Company issued 6 per cent cumulative preferred stock, totaling $5,000,000, the price being $94.50 per share and accrued dividend, to yield 6.35 per cent.

The Gulf States Utilities Company issued 30,000 shares of $6 dividend preferred stock at 100 and accrued dividend. Proceeds from the sale of this stock will be used to provide additional capacity to care for the rapidly expanding business or to reduce notes payable, which on Nov. 30, 1927, amounted to $2,885,000, held by the Eastern Texas Electric Company. One-third of this issue has been reserved by the company for sale in the territory served.

Gold bonds of the Arizona Edison Company were issued to the amount of $1,700,000, the price being 96 and interest, to yield about 5.33 per cent. These bonds, dated Jan. 1, 1928, mature Jan. 1, 1948.

NEW PUBLIC SERVICE ISSUE.—The Public Service Company of New Hampshire has been granted authority to issue $1,800,000 in 4½ per cent first and refunding mortgage gold bonds by the Public Service Commission. Decision regarding the petition of the company to issue 3,400 shares of preferred stock $6 dividend series was reserved. The issue is planned to cover the purchase of electric properties at Salmon Falls, Conway and West Stewartstown.

NEW ENGLAND POWER STOCK ISSUE.—The New England Power Company, Worcester, Mass., has petitioned the Public Utilities Commission for authority to change the par value of its common stock from $100 to $25 and to issue additional common stock to the amount of $1,700,000. The company already has a petition pending with the commission that seeks an issue of additional common stock to the amount of $5,100,000.

WESTERN ELECTRIC PAYS SPECIAL DIVIDEND.—Directors of the Western Electric Company on Dec. 13 declared a special dividend of $13 per share in addition to the regular quarterly dividend of 50 cents per share on the outstanding 3,750,000 shares of no-par-value common stock, both payable Dec. 31 to holders of record Dec. 24.

STOCK PROFITS DISTRIBUTED TO SHAREHOLDERS.—Directors of the Connecticut Power Company, Hartford, Conn., have authorized the distribution to stockholders of a $75,000 profit accrued from the sale of 5,000 shares of stock of the New England Power Company at $65, purchased in 1925 for $50 a share. A payment of $1 a share was paid to stockholders Jan. 5 to stock of record Dec. 27. The Hartford Electric Light Company also authorized a payment to stockholders of the major part of profits of $150,000 from the sale of 10,000 shares of stock for $65 a share, all of which was purchased from the New England Power Association in 1925 for $50 a share. A similar distribution was made to that in the case of the Connecticut Power Company.

EDISON COMPANY TO ACQUIRE ONTARIO POWER SHARES.—Application has been filed by the Southern California Edison Company for permission to acquire the 4,750 shares of preferred stock outstanding of the Ontario (Calif.) Power Company. The Edison company had previously applied for permission to acquire all of the outstanding common stock of the Ontario company.

# Business News and Market Conditions

SALES in the industry are light and inquiries have fallen off in virtually all sections of the country. Electrical men point to this condition as seasonal and say that projects ahead indicate an early resumption of activity. In New England small motor sales maintain a good showing and optimism is prevalent despite a slow start. Inquiries show a tendency to lag in the Eastern district but there are indications that sizable commitments will be made both by industrial and central-station plants as well as railways.

In St. Louis manufacturers are optimistic, and several inquiries are reported for oil pipe line pumping equipment. A seasonal lull is noted in the Southeast but there is a reasonable amount of industrial business in prospect. In the Middle West the building outlook is encouraging. On the Pacific Coast many large buildings are projected. A cement company purchased $100,000 worth of switchboard, oil circuit breakers and other equipment, and the city of Tacoma ordered $6,000 worth of current-limiting reactors and a voltage regulator. An appropriation of $65,000 and authority to purchase certain electrical equipment for Seattle's Cedar Falls plant is before the financial and utilities committee of the city council.

## *Early Orders Expected in Eastern District*

While inquiries show a tendency to lag in the Eastern district, market interest is lively, owing to indications that sizable commitments soon will be made both by industrial and central-station plants. One manufacturer states that inquiries are just about one-half as much as in the early weeks of December. An optimistic tone is shown in connection with forthcoming railroad business. Sales have been good during the last few weeks, and, with definite appropriations for electrification work, it is expected that 1928 will produce high records in that line. On the other hand, electric traction sales are extremely light at the moment and a prominent manufacturer of such equipment looks for the slow movement to prevail for a number of weeks. Several utilities are expected to enter the market at an early date for transformers, switching equipment, controls and other substation apparatus. Business in heavy motors and other industrial electrical equipment is holding up well, and the next 30 to 60 days is expected to bring to maturity several orders now pending. Fractional horsepower motors are noticeably weak at present, and not much is looked for in this direction for a number of weeks to come.

Northern New York is developing as a bright spot in the present situation. The Buffalo, Niagara & Eastern Power Company, Buffalo, has placed an order with a large manufacturer for a good quantity of distributing equipment for local installation, and is scheduling an active year for work of this character. Another utility in this section will soon give a contract for a heavy amount of substation apparatus. The Plattsburg Power & Electric Corporation is concluding arrangements for the acquisition of the hydro-electric power plant of Peck Brothers at Shushan, Washington County, and will tie in with its system. The new year shows advancing activity in the Baltimore district and good central station business is anticipated in this quarter. The Consolidated Gas, Electric Light & Power Company of Baltimore will be actively interested in the proposed hydro-electric power plant to be located on the Susquehanna River, south of Holtwood, Pa., on which initial work will soon begin. The ultimate project will cost close to $20,000,000.

Current construction operations in the Eastern district include the following: The Public Service Electric & Gas Company, Newark, N. J., plans a substation on Peace Street, New Brunswick, to cost about $75,000. Jersey City, N. J., plans a marine terminal on the Hudson River waterfront to cost approximately $10,000,000. Harrison, N. J., plans installating an ornamental lighting system on Fourth Street. The American Gas & Electric Company, New York, plans a steel-tower transmission line from site of its proposed power plant at Churchtown, near Pennsville, N. J., to a connection with the system of the Atlantic City Electric Company, estimated to cost $1,000,000.

## *Volume of Metal Sales Higher at Steady Prices*

Sales of most of the non-ferrous metals have been of average volume. Prices, in general, have shown little change, with the exception of tin which has declined over a cent during the week in view of a weaker market in London.

NEW YORK METAL MARKET PRICES

| | Jan. 4, 1928 Cents per Pound | Jan. 11, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14⅛ | 14.05-14.125 |
| Lead, Am. S. & R. price | 6¼ | 6¼ |
| Antimony........... | 10⅝ | 10¾ |
| Nickel, ingot ...... | 35 | 35 |
| Zinc spots......... | 5.95 | 6 |
| Tin, Straits .... | 10⅞ | 56⅛ |
| Aluminum, 99 per cent | 24 30 | 24 30 |

Base copper wire price Jan. 11, 1928, 15¾ cents

In fact, all the metals have been weaker in London in the last two or three days. Though it is the general impression that the copper market is very quiet, the total domestic sales have been the highest since the first week of December, and not far below an average week's business. Buying has been fairly well distributed between rolling mills and brass manufacturers. More than the usual proportion has been taken by Middle Western consumers, reflecting greater activity in automobile lines, especially Ford.

## *Sales in New England District Are Light*

Sales of electrical supplies and equipment in the New England district are light. Central-station orders were confined to a few purchases of switch and control apparatus, one of which for about $5,000 was noted. Heavy equipment interests lagged and inquiries are few. Small motor sales, alone, maintain a good showing and orders for a number of ratings from 10 hp. up to 30 hp. are recorded. One representative reports an increase in demand for motor-connected pump units, and another reports elevator-control apparatus is attracting more attention than at this time last year. Scheduled material is in steady demand, though the orders are for small lots as a rule. A prominent manufacturer forecasts normal business prospects for the coming year. General optimism prevails, despite what appears to be a slow start.

## *Heavy Building Planned on Pacific Coast*

Projected construction, recently announced on the Pacific Coast includes the new plant of the Loyola University near Los Angeles, worth $5,000,000, the $1,250,000 Bar Association Building and the $800,000 medical building, both of Los Angeles, and a $600,000 apartment house, the $400,000 Y.M.C.A. hotel and the $2,000,000 Olympic Club of San Francisco. New hospitals are projected for East Oakland and the University of California campus in Berkeley. Street lighting plans for Shattuck Avenue in Berkeley, Waverley Avenue in Palo Alto and for the city of Tulare are now being prepared. An airport for Livermore is projected. Machinery orders reported include eight assorted motors sizes 5 hp. to 50 hp., valued at $8,000, for a steel company in the Bay region. A 100-hp. synchronous compressor motor, valued at $2,000, for a chemical company. A 55-hp. oil well motor, complete with transformer and accessories, valued at $3,500, and six transformers, size 50-kva., valued at $4,000 for the Kern Oil Fields; a motor-driven air compressor, valued at $6,000; a lightning arrester, valued at $3,000 for the Truckee District, six assorted transformers, 50 kva. and 75 kva., valued at $4,500, for a mining company and motor generator sets and accessories, valued at $6,000 for the United States Navy Yard at Mare Island, an order for 32 duplex electroliers, valued at $7,000, is reported as an extension to the Modesto lighting system. There are about 50 in. of snow on the Sierras, a little better than the average. All natural business factors are excellent.

The majority of Seattle jobbers report inventory will be completed within ten days' time and that last week's sales established a new record for a like time and period. Equipment costing $100,000 was purchased by the Superior Portland Cement Company at Concrete, Wash.; $6,000 of current-limiting reactors and one induction-type single-phase voltage regulator for the city of Tacoma, and about 75 motors, ranging from 100 hp. down distributed among out-of-town dealers, lumber mills and industrial plants. An appropriation of $65,000 and authority to purchase certain electrical equipment for Seattle's Cedar Falls plant is before the finance and utilities committees of the city council. Construction projects are as follows: The Gila Bend Light & Power Company, Gila Bend, Ariz., plans a power plant to cost about $35,000; and also a local street-lighting system; the Salt River Valley Water Users' Association, Phoenix, Ariz., plans a transmission line and pumping plants in connection with a proposed irrigation project to cost about $6,000,000; Los Angeles, Calif., plans a lighting system on Bronson Avenue, and portions of Fourth, Fifth and Martland Streets, as well as on the Harbor Boulevard and Valley Spring Lane; the Pacific Gas & Electric Company will extend its power plant at Napa, Calif.; Sacramento, Calif., plans a lighting system on a number of streets, with underground conduit lines; San Francisco, Calif., will install an improved lighting system on Golden Gate Avenue; Stockton, Calif., plans an early call for bids for an ornamental lighting system on Center and Main Streets, and Weber Avenue, to cost about $75,000; Tulare, Calif., plans a lighting system in the business district; Southern California Edison Company will build a new substation at San Marino; the Mountain States Telephone & Telegraph Company will extend its central station at Meridian, Idaho, to cost $35,000, and the Peru Mining Company, Deming, N. M., plans a milling plant to cost in excess of $125,000.

## *Seasonal Lull Evident in Southeast*

A seasonal lull is evident in the electrical field in the Southeast, and central-station companies are purchasing mostly for immediate requirements. The only large order placed was by a new motor-assembling plant and called for power transformers totaling 1,500 kva. and distribution transformers aggregating 1,325 kva. There is a reasonable amount of other industrial business in prospect but no immediate announcements are expected. The demand for transformers and meters continues satisfactory, one central-station company purchasing small power and distribution transformers totaling $14,700, while its house type meter orders aggregated $8,000. Some other central-station orders during the past ten days called for switch house and switching equipment amounting to $5,100 and bushings and arresters totaling $3,100. Two municipalities in Georgia recently placed orders for poles for maintenance work, one order amounting to $1,000 and the other $600. Another Georgia town ordered white-way equipment totaling $7,000.

A large restaurant being built in a Georgia city contemplates the purchase of electric ovens and miscellaneous heating appliance to the extent of $3,000 and orders will undoubtedly be placed this week. The Georgia Power Company will construct 6 miles of 2,300-volt 3-phase line for the purpose of supplying service to the towns of Belleville and Manassas and also will construct a multiple street-lighting system in the latter town.

Construction projects are as follows: The Florida Public Service Company has purchased property at Fort Meade, Fla., and plans construction of a substation. The Lavonia Cotton Mfg. Co., Lavonia, Ga., will soon begin the complete electrification of its mill, estimated to cost $50,000; the Georgia Power Company plans a transmission line from Louisville to Waynesboro, and to Vadalia, Mount Vernon and McRae, with a substation to be built at the last noted place; Waynesboro, Miss., plans an ornamental lighting system in the downtown district; the Carbide & Carbon Chemical Corporation, South Charleston, W. Va., plans rebuilding the portion of its plant recently destroyed by fire with loss of more than $350,000.

## *Manufacturers Optimistic in St. Louis District*

The feeling expressed by manufacturers and power company officials regarding business in the St. Louis district is optimistic. Inquiries have been received for oil pipe-line pumping equipment, and local contracts were closed for two 1,500-kva. transformers and one 80-kva. generator. In the western part of the district an order was placed for switching equipment valued at $33,000 and circuit breakers amounting to $1,300. An order from the southwest section called for lift-bridge equipment, consisting of motors and control and amounting to $4,500. Jobbers report a fair general business and a good movement of building materials.

Construction projects are as follows: Bentonville, Ark., plans an ornamental lighting system in the business district; the Arkansas Power & Light Company will improve its Woodward and Dixie substations, and will construct a 110,000-volt transmission line between the two points, at an estimated cost of $450,000; Kansas Power & Light Company, Atchison, Kan., plans additions to its ice plant; the Bastrop Ice & Storage Company, Bastrop, La., plans an addition to its ice plant to increase the capacity to 60 tons; the City Ice Company, Kansas City, Mo., plans, an ice plant at Fifteenth and Winchester Streets; the Southwestern Light & Power Company has contracted with Chickasha, Okla., for a lighting system in the business district; the Texas Electric Service Company plans a transmission line from Wichita Falls to Dundee, Tex.; Central Power & Light Company plans improvements in its power plant at Laredo, Tex., to cost close to $250,000; the Texas Power & Light Company will construct a transmission line from Lufkin to Huntington, Tex.; the San Antonio Public Service Company plans the addition of a 30,000 kw. unit at its Comal power plant at New Braunfels and the Woldert Peanut Products Company, Tyler, Tex., plans rebuilding the portion of its plant recently destroyed by fire with a loss of about $400,000.

## *Building Outlook Encouraging in Middle West*

The Middle West apparently got off to a good start the first week of the new year. Final reports of inventories indicate normal stocks on hand and a general good condition. Week end reviews report an entirely optimistic attitude toward the coming year, with expressed determination to make 1928 equal, or surpass, 1927. The building outlook is encouraging, heavy awards for highway construction are anticipated, and large track accessory purchases were made this week, approximately 20,000 tons being placed since Jan. 1. The various utility companies will undoubtedly continue their conservative policy of purchasing which proved so successful last year. Among the interesting items placed this week were 655,000 lb. Muntz metal condenser tubes, complete coal storage and reclaiming equipment with appurtenances, and two ash sluicing pumps with appurtenances. Jobber's sales are about normal for this period of the year. A survey of last year indicates increased sales of appliances except fan motors, and 1928 is expected to equal this record.

The Bennett Organ Company, Blue Island, Ill., plans an addition to cost $200,000; Champaign, Ill., plans a lighting system to cost $35,000; the Elgin National Watch Company, Elgin, Ill., plans a new addition, estimated to cost $450,000; the Indiana Board of Agriculture, Indianapolis, Ind., has approved plans for an improved lighting system at the State Fair Grounds; the Central States Power & Light Company has approved plans for an addition to its power plant at Iowa Falls, Iowa, to cost about $300,000, and also will extend transmission lines; Sidney, Iowa, plans a municipal power plant; the Wolverine Tube Company, Detroit, Mich., plans extensions in its plant to cost about $300,000; the Lansing Ice & Fuel Company, Lansing, Mich., plans extension in its ice plant; Benson, Minn., has authorized plans for a municipal power plant and system; the Public Service Company has authorized the construction of a transmission line to Edmore, N. D., and vicinity; the Cleveland Electric Illuminating Company, Cleveland, plans an addition to its storage plant on Miles Avenue.

# Activities of the Trade

## Westinghouse Gets Order for Ten Electric Cars

L. S. Miller, president of the New York, Westchester & Boston Railway Company, has announced the placing of an order for ten additional electric passenger cars with the Westinghouse Electric & Manufacturing Company. These new cars are to be put into operation on a new extension which the New York, Westchester & Boston Railway is constructing between Harrison and Rye, N. Y., and which will be finished about next spring. The cars are 72 ft. over all in length and will be equipped with Westinghouse single-phase motors and control.

## Pacific Coast Contract Let to Pelton and General Electric

The city of Seattle, Board of Public Works, has awarded contracts on three items of the $145,000 worth of hydro-electric generating equipment for the No. 6 unit of Cedar Falls. Contract for an 18,000-hp. turbine, costing $60,285, and a 325-hp. water wheel, costing $4,985, for driving an exciter, was let to the Pelton Waterwheel Company of San Francisco. A contract for three 5,000-kva. transformers, costing $24,885, was also let to the General Electric Company.

## Woodward Governor to Hold School of Instruction

Following a practice inaugurated last year by the Woodward Governor Company of Rockford, Ill., the company will hold at its factory during the last day of January and the first three days of February, 1928, a school of instruction on the care, operation and theory of governor-operation in general. The school will deal strictly with governor problems and is open to anyone interested. The company states that it will provide the school and the instruction so that power companies and anyone interested may send their representatives to attend the school at their own expense.

## General Electric Establishes Contributory Pension Plan

A contributory pension plan whereby employees pay a small part of their wages from year to year to a pension fund, supplementing the old-age pension system which the General Electric Company has had in effect since 1912, has been announced by Gerard Swope, president of the company. At the same time Mr. Swope announced the creation of a pension trust. Instead of the company carrying a reserve on its balance sheet sufficient to meet its obligation to employees reaching the retiring age, $5,000,000 has been turned over to the trustees of the new trust by the company.

Pensions at present are computed at 1½ per cent of the earnings of employees for each year of continuous service. Under the contributory plan of additional pension which it is proposed to make effective Jan. 1, 1929, 1½ per cent of the annual earnings of the employees will be turned over to the custodians, a board of seven, on which the employees will have representation. This money will be invested and held for the employees individually. Interest will be allowed to accumulate. The retiring age in the past has been 70 years for men. Under the new plan it is proposed to make this 65 years for men and, as at present, 60 years for women. At the time an employee reaches the retiring age the custodians of the fund will pay the accumulated amount in full or in installments. If an employee leaves the service of the company or dies before reaching the pension age, the amount accumulated, with interest, will be given him or his estate.

## General Electric Orders for 1927 Decrease 5 Per Cent

Orders received by the General Electric Company during the year 1927 amounted to $309,784,623 compared with $327,400,207 for 1926, a decrease of 5 per cent, Gerard Swope, president, has announced. For the three months ended Dec. 31, orders amounted to $76,708,532 compared with $80,406,570 for the final quarter of 1926, also a decrease of 5 per cent. Sales billed and earnings for the year will be announced the latter part of March, when the annual report of the company is published.

## Allis-Chalmers Company to Build Plant in Seattle

The erection of a three-story plant at First Avenue, South, and Atlantic Street, is planned by the Allis-Chalmers Manufacturing Company, Milwaukee. Work is scheduled to begin March 1 on a concrete structure, 60x150 ft., to cost about $100,000. The plant will be used for manufacturing and assembling purposes.

The Clay Products Company, Inc., Brazil, Ind., manufacturer of "Super-Quality" vitrified clay conduit, announces a change in its marketing policy. Except in a few isolated territories, the company will sell directly to the customer, instead of through distributors, as in the past. The company expects, through this arrangement, to furnish better service, and to assure the quality of the delivered conduits. Frank N. Gormley will remain in charge of clay conduit sales.

The Eureka Vacuum Cleaner Company, Detroit, announces that on Dec. 14 it produced the two-millionth Eureka vacuum cleaner. Unlike its predecessors, this units is made of black velvet, rhinestones and gold. After being displayed at one of the company's major branches, it will be placed in a permanent exhibition at the Detroit offices of the company, along with the millionth cleaner.

The Henkel Manufacturing Company, 122 South Michigan Boulevard, Chicago, announces an electric fixture-mirror-cabinet combination known as the "Edge-Lite" for bathrooms. The combination has an adjustable lighting fixture which can easily be placed on any of the three sides of the mirror by sliding it in a grooved slot in the frame.

The Electric Vacuum Cleaner Company, Inc., Cleveland, announces that Ralph B. Wilson, who joined the organization in 1920 as manager of central station sales, has been appointed vice-president and general sales manager. Harry C. Hahn, who has been Mr. Wilson's assistant for the last several years, has been named as the new head of the central-station sales department of the company.

The Gillette-Vibber Company, New London, Conn., manufacturer of "Gee-Vee" electrical specialties, announces a new type of "Gee-Vee Endo," a split-type fitting for clamping on the ends of armored cables.

The Parker-Kalon Corporation, New York City, manufacturer of metallic drive screws, announces that its factory and general offices will move from 352 West Thirteenth Street, to 200 Varick Street, New York City on Dec. 1.

The Black & Decker Manufacturing Company, Towson, Md., announces a combination grinder and buffer furnished with a 5-in. grinding wheel and a 6-in. wire wheel brush. The company has also placed on the market a new ball-bearing ½-in. electric drill.

The Ohio Brass Company, Mansfield, Ohio, announces the opening of an office at 721 Healy Building, Atlanta. K. V. Farmer, H. H. Hoxie, J. A. Whatley and G. W. Willis, sales representatives of the company in that part of the country, will be stationed at that office.

The Lincoln Electric Company, Cleveland, announces the transfer of John Van Horne from Atlanta to Moline, Ill., where he will be found at 514½ Fifteenth Street, covering the Tri-Cities for the sale of "Linc-Weld" motors and "Stable-Arc" welders. He will operate under the direction of R. D. Malm, Western manager at Chicago.

# New Equipment Available

## "Switch Start" Motor

A new "Switch Start" motor built in sizes from ½ hp. to 30 hp. for either two-phase or three-phase, 60-cycle current has been placed on the market by the Lincoln Electric Company, Cleveland. This motor is so designed that it can be started directly across the line and the starting current will be below the requirements of the National Electric Light Association. The chief claim of the manufacturer for the motor is that operating characteristics, such as power factor, efficiency, maximum torque, temperature rise, etc., have not been sacrificed in order to secure low starting currents.

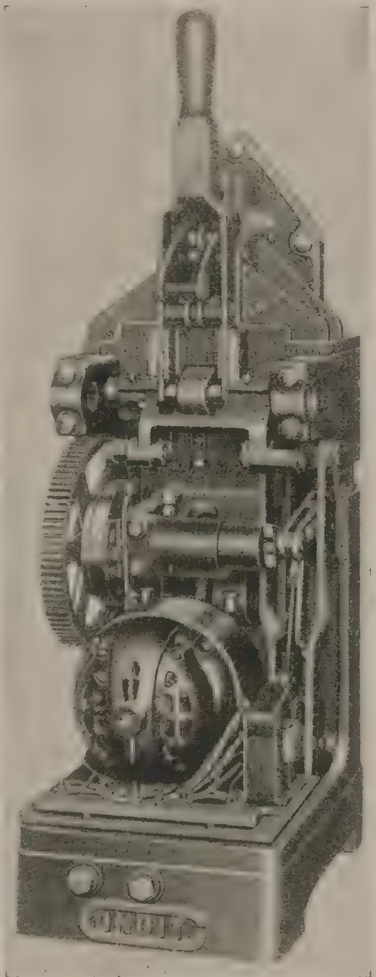
Tests made by the manufacturer show that starting torques of from full load to better than 250 per cent of full load, depending on the horsepower and speed, are possible without exceeding the N.E.L.A. requirements as to starting currents. The torque curve of the "Switch Start" motor shows a gradually increasing torque up to the maximum torque point. On sudden high overloads it is claimed that the "Switch Start" motor also has a very high or maximum pull-out torque. The line is of welded steel construction and is normally equipped with sleeve bearings, although ball bearings will be furnished at the customer's request. Large shafts, large bearings and waterproofed insulation are claimed for these motors.

## Fuse and Disconnect Cut-Out

A double-duty fuse and disconnect cut-out which will act as a protective unit has been developed by the James R. Kearney Corporation, 4224 Clayton Avenue, St. Louis. The cut-out acts as a protective unit by having a higher rupturing capacity. The housing and handle are made of vacuum plastic wet-process porcelain. The manufacturer states that the horn fiber used in the construction of this cutout is specially treated and seasoned and a coat of Bakelite varnish applied to exclude moisture. The cartridge contacts are made of materials of high resilient qualities, and the brass line contact castings are of generous proportions. The cut-out is available in eight different types.

## High-Speed Circuit-Breaker Closing Mechanism

An oil circuit breaker closing mechanism (type MO-1) of compact design has been developed by the Condit Electrical Manufacturing Corporation, Boston. It consists essentially of a combination of springs, mechanism and a motor through which stored energy is released for closure at will or automatically. The actuating spring is always under tension ready for closure, as the motor sets the spring after each closing operation. Less than one-fourth second elapses between the energizing of the release coil and the closing of the breaker. After closing, from five to ten seconds is taken by the motor in storing energy in the spring for the next operation, depending on the size and type of breaker. Automatic reclosing may be obtained by using an external timing relay. The mechanism is well adapted to panel, panel frame or wall mounting in substations or isolated switch houses. It can be furnished as follows: Automatic trip-free with one, two or three coils; transformer trip or two-coil series trip. It can be operated from a 200-watt potential transformer. The mechanism is specially adapted to the operation of moderate capacity breakers for synchronizing purposes and for automatic change-over switching.



OIL CIRCUIT-BREAKER CLOSING MECHANISM. AN EXTERNAL TIMING RELAY WILL PROVIDE AUTOMATIC RECLOSING

## Dust-Tight and Oil-Immersed Starting Equipment

For special applications the Westinghouse Electric & Manufacturing Company is now building two modifications of its standard equipment of "Line-starters." One of these has special provision for excluding dust. Another modification has all of its parts in which sparks or arcing might occur immersed in oil. Another development is a water-tight and gas-tight push-button station, in which all the elements that operate to open and close the circuit and on which there may be sparking are inclosed in an air-tight chamber.

## Low-Voltage Terminal

A new type of low-voltage terminal for indoor or station service has been recently placed on the market by the Standard Underground Cable Company, Pittsburgh. It is designed for mounting on the end of pipe conduit or connected to the sheath of a lead-covered cable by means of a stuffing box gland or a plumber's wiped joint. The line is made of cast iron with bakelite insulating tops and conductor outlets, the joints being rendered moisture-proof by liberal gaskets. These terminals are suitable for terminating low-voltage power or control cables or similar low-potential conductors.

IMMERSION HEATER.—An electric immersion heater for electroplating solutions and other liquids which will not attack lead has been developed by the General Electric Company. It is primarily intended for low-temperature heating only. The unit consists of a steel-sheathed helicoil unit covered with a lead jacket swaged tight to the steel unit. The terminals are brought into a terminal box suitable for conduit connections. It is made in two sizes, both for a maximum demand of 5 kw., one for 110-volt circuits and the other for 220-volts. Only the lower portion of the heater dissipates heat. The upper portion, being inactive, allows the unit to be used in tanks in which the level of the solution may be as low as 10 in. from the top of the tank. The heater can be supplied in different formations.

NEON LIGHT FOR AVIATION USE.—A new type of quartz neon gas-filled lamp for aviation use has been developed by research engineers of the General Electric Company. The lamp, which resembles a ball of reddish orange fire when in use, emits all its visible radiations in the long wave lengths, which tests have shown to have greater fog-penetrating power than light higher in the spectrum. It was found that during a heavy morning mist, when the laboratory building in which the new lamp was housed could not be seen 500 ft. away, the brilliant red glow penetrated to a distance of half a mile or more.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Dec. 20, 1927)

1,652,999. Electric Motor; S. C. Benson, Cleveland, O. App. filed Oct. 25, 1921. Means for automatically cutting off the electric supply and to stop the motor, whenever objectionable sparking occurs at the commutator and particularly when the armature coil opens.

1,653,014. Induction Heater; E. E. Kittredge, J. A. Forster and R. D. Johansen, Alameda, Calif. App. filed Aug. 10, 1926.

1,653,031. Signaling System; F. Zogbaum, New York, N. Y. App. filed Jan. 19, 1922. In which switches or other objects may be remotely controlled and supervised.

1,653,070. Resistance Regulating Apparatus for Electric Welding; A. Smith, San Mateo, Calif. App. filed April 20, 1925.

1,653,078. Relay; F. H. Winter, Schenectady, N. Y. App. filed Jan. 12, 1927. Differential relay.

1,653,086. Electric Switch; C. Christensen, Chicago, Ill. App. filed March 13, 1923. Oil break type.

1,653,107. Single Phase Transformer; W. Kochling, Waidmannslust-Berlin, Germany. App. filed May 17, 1927. Having a magnetic core with an uneven number of winding legs such as three, five, and so forth, the windings being so arranged that the magnetic flux in adjacent winding legs flows in opposite directions.

1,653,117. Suspension Insulator; J. M. Peck, Honeoye Falls, N. Y. App. filed June 26, 1925.

1,653,141. Electrode Holder; J. E. Woodland, Richmond Hill, N. Y. App. filed June 23, 1926. For holding the carbon electrodes in motion picture machines and similar apparatus.

1,653,177. Flow Indicator; A. Herz, Chicago, Ill. App. filed Dec. 26, 1924. Also for use as low water alarm.

1,653,195. Tripping Device for Electric Switches; J. D. Wood, Quincy, Mass. App. filed Nov. 3, 1924.

1,653,251. Temporary Fastening Means for Outlet Boxes; J. C. Boyton, Cleveland, O. App. filed July 9, 1926.

1,653,267. Device for Pulling Cables and Flexible Conduits; D. H. Garber, deceased, by G. E. Dunn and A. C. Neer, Indianapolis, Ind. App. filed Aug. 7, 1924.

1,653,283. Circuit Making and Breaking Device; S. B. Hood, Minneapolis, Minn. App. filed July 31, 1924. Using a liquid medium, such as mercury.

1,653,365. Incandescent Electric Lamp; C. F. Lorenz, East Orange, N. J. App. filed June 28, 1923. For projection purposes.

1,653,367. Misch Metal Wire; J. W. Marden and M. N. Rich, East Orange, N. J. App. filed Jan. 29, 1925. The production of misch metal in a form suitable for introduction into vacuum devices to serve as a clean-up agent and method of fabricating in ribbon form.

1,653,375. Protective Device; B. E. Shackelford, East Orange, and W. H. T. Holden, Bloomfield, N. J. App. filed Feb. 15, 1921.

1,653,376. Arc Welding Machine; J. S. Skelly, Monongahela, Pa. App. filed April 8, 1925. Adapted for use in welding the edges of the plates of an air-heating element or similar article.

1,653,378. Method of Making Bimetallic Wire; B. F. Steel, East Orange, N. J. App. filed July 1, 1922.

1,653,385. Lamp Mount; E. W. Beggs, Glen Ridge, N. J. App. filed Nov. 16, 1923. For lamp operated at a high temperature and utilized as a light source for projection apparatus.

1,653,404. Automatic Reclosing Mechanism; G. H. Middlemiss, Birmingham, England. App. filed June 20, 1924.

1,653,436. Insulator; H. P. Liversidge, Bala, Pa. App. filed July 22, 1918. Having band or sleeve shrunk on the insulator for subsequent connection with a top or base, as by co-operating screw threads or other desirable mechanical means.

1,653,443. Controller for Electric Elevators; E. B. Thurston, Toledo, O. App. filed Nov. 19, 1926. Using polyphase alternating current motors.

1,653,504. Transformer; E. Moxter, St. Louis, Mo. App. filed Nov. 22, 1923. Secondary current selectively effected independently of any change or variation in the voltage of the primary current and independently also of any variation or change in the structural factors and ratio of both the primary and secondary windings.

1,653,565. Method of Butt Welding by Means of an Electric Arc; W. F. Heinemann, Shorewood, Wis. App. filed Aug. 13, 1926.

1,653,579. Storage Battery Attachment; P. M. Marko, Brooklyn, N. Y. App. filed July 24, 1926. To permit the use of a "trickle" charger with the battery.

1,653,584. Insulator Support for Wires; P. L. Peterson, Worcester, Mass. App. filed March 27, 1926. For securing twin wires to the side of a pole or post.

1,653,599. Discharge Bar for Neutralizing Static Electricity; W. H. Chapman, Portland, Me. App. filed April 8, 1927. Such as are placed near the surface of textile fabrics or paper in the process of manufacture or printing.

1,653,600. Electric Battery Cell Unit and Process of Making the Same; H. M. R. Dam, Astoria, N. Y. App. filed Dec. 15, 1924. Of the flat type.

1,653,602. Thermostatic Device; W. C. Lindemann and E. A. Rutenber, Milwaukee, Wis. App. filed April 24, 1923. For automatically controlling the temperature of ovens and the like.

1,653,605. Method of Protecting Carbon or Graphite Electrodes in Fused Electrolytes; E. A. Ashcroft, Waye, near Ashburton, England. App. filed Feb. 23, 1927.

(Issued Dec. 27, 1927)

1,653,614. Storage Battery Separator; R. C. Benner, Bayside, N. Y. App. filed Oct. 9, 1922.

1,653,659. Thermostatic Control Device; H. E. Reeve, Deceased; by Helen Reeve, Executrix, New York, N. Y. App. filed March 21, 1922. For automatically making and breaking a power circuit or for otherwise exerting power greater than that supplied by the direct action of a thermostat upon change in temperature.

1,653,669. Combination Flash Light and Circuit Tester; B. M. Rydzy, Michigan City, Ind. App. filed June 29, 1923.

1,653,671. Lighting Fixture; E. O. Schweitzer, Chicago, Ill. App. filed April 4, 1923. Of the wall or side bracket type.

1,653,672. Water Heater; R. L. Shriner, Weehawken, N. J. App. filed March 6, 1926. For domestic use.

1,653,724. Plug; C. Moline, Multnomah, Ore. App. filed May 7, 1926. Quick detachable plug to connect a flexible cord to a socket or receptacle.

1,653,731. Anodic Current Accumulator Battery; G. Reinstrom, Wandsbek, near Hamburg, Germany. App. filed April 7, 1926.

1,653,751. Electric Cigarette Lighter; S. Wagner, New York, N. Y. App. filed March 5, 1927.

1,653,776. Multiple-Point Plug; O. E. Marvel, Dayton, O. App. filed March 12, 1923. For handling a large number of circuits in a comparatively small space.

1,653,778. Antitheft Alarm Device; J. Nawarynski, Cleveland, O. App. filed April 18, 1927. For sounding an alarm when a window is raised.

1,653,784. Winding for Electrical Machines; L. Roebel, Mannheim, Germany. App. filed April 16, 1927. The construction of the coil heads or connectors interconnecting spaced bars of coils disposed in slots on the periphery of dynamo-electric machines.

1,653,797. Electric Stove; E. D. Brand, London, Ont., Canada. App. filed Oct. 16, 1924. Heavy duty.

1,653,801. Dry Cell; H. de Olaneta, New Haven, Conn. App. filed Aug. 18, 1920.

1,653,810. Electric Light Fixture; J. Markel, Buffalo, and C. W. Logan, Kenmore, N. Y. App. filed March 31, 1927.

1,653,823. Contact Device for Key Switches; R. Pudelko, Zug, Switzerland. App. filed Oct. 6, 1924.

1,653,833. Connector for Battery Terminals and Other Electrical Conductors; H. E. Atkinson, Traverse City, Mich. App. filed Sept. 17, 1925.

1,653,845. Cooling of Dynamo Electric Machines; P. Faber, Baden, Switzerland. App. filed June 18, 1925. A cooling system having an independently propelled fluid-circulating machine for supplying cooling fluids to the machine, and automatic means for protecting the machines upon failure of the cooling fluid supply.

1,653,855. Catenary Suspension System; J. Holzel, Pasing, near Munich, Germany. App. filed Dec. 13, 1926.

1,653,868. Burglar Alarm; H. J. Murray, Brooklyn, N. Y. App. filed Jan. 17, 1920.

1,653,872. Method of Manufacturing Electrodes for Batteries; D. Pepper, Philadelphia, Pa. App. filed Dec. 1, 1924.

1,653,879. Electrolytic Cell; West Orange, N. J. App. filed Oct. 22, 1924.

1,653,895. High Tension Cable Joint and Method of Making the Same; L. Emanueli, Milan, Italy. App. filed Nov. 19, 1926.

1,653,941. Electrical Switch; C. A. Brown, Lorain, O. App. filed March 8, 1926. Wherein it is desired to operate a set of electrical contacts quickly, so that sparking at the contacts will be reduced.

1,653,946. Electric Step by Step Motor; H. Clausen, Cricklewood, London, England. App. filed June 13, 1924.

# New Trade Literature

**Hydraulic Pumps and Motors.**—The American Fluid Motors Company, Philadelphia, is distributing a catalog on Hele-Shaw hydraulic pumps and motors. This catalog describes and illustrates the application of high-pressure hydraulic power on a variety of machinery drives, including presses, broaching machines, testing machines, cranes, mechanical stokers and a wide variety of other heavy machinery.

**Automatic Switching Equipments, Meters and Relay.**—Bulletins GEA-189A, GEA-862 and GEA-859, issued by the General Electric Company, Schenectady, N. Y., describe and illustrate respectively the automatic switching equipments for indoor alternating-current reclosing feeder service; types M-5 and M-12 direct-current, indicating demand meters; and type PD-3 current differential relay.

**Low-Temperature Coal Distillation.**—Catalog KSG-2, issued by the International Coal Carbonization Company, 200 Madison Avenue, New York City, a subsidiary of the International Combustion Engineering Corporation, covers the KSG process for the low-temperature carbonization of coal.

**Outdoor Station Equipment.**—Bulletin GEA-748A, issued by the General Electric Company, Schenectady, N. Y., describes and illustrates the G-E bus supports for outdoor service, the G-E standard pin-type insulators, the separable post-type insulators and connectors and fittings for tubular conductors.

**Electric Fans.**—The Robbins & Myers Company, Springfield, Ohio, has issued its miniature fan catalog No. 1355 for 1928 covering the various types of "R&M" desk, wall and ceiling fans.

**Wire and Wire Products.**—The Hoffman Publications, Inc., 471 Fourth Avenue, New York City, has issued a leather-bound 1928 edition directory, index and buyers guide on wire and wire products.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Sydney, Australia (No. 28,823), for small and medium size electric motors, and another (No. 28,824) for fractional horsepower motors.

An agency is desired in Wellington, New Zealand (No. 28,822), for electric ranges.

Purchase is desired in Leghorn, Italy (No. 28,771), of commercial electric refrigerators.

Purchase is desired in Auckland, New Zealand (No. 28,851), of electric fixtures and appliances.

Purchase is desired in Meiningen, Germany (No. 28,848), of floor-polishing and scrubbing machines and vacuum cleaners.

Purchase is desired in Colon, Panama (No. 28,852), of small floor-tile polishers.

An agency is desired in Vienna, Austria (No. 28,882), for portable electric tools.

Purchase is desired in Montreal, Canada (No. 28,853), of immersion water heaters.

Purchase is desired in Johannesburg, South Africa (No. 28,942), of hand and miners' electric lamps, flash-light [illegible] and railway warning signals.

Purchase is desired in Prague, Czechoslovakia (No. 28,943), of traffic control signals.

VOLUME 91 *New York, Saturday, January 21, 1928* NUMBER 3

## *An Unsatisfactory Official Summary*

IT IS difficult to come to any definite conclusion from the meager summary of the Federal Trade Commission's report on "the supply of electrical equipment and competitive conditions," at least so far as the electric power industry is concerned, and it is equally hard to escape the thought that perhaps there was a reason for bringing out the summary at this particular time. Viewed in the abstract, the presentation appears reasonable in spots, while in other places it is open to serious questioning and doubt. What is said of holding companies may be true of some of them, but certainly not of all of them. That they are not subject to regulation is, of course, well known, as is also the fact that rates for service of underlying companies are based in many states "on the capital honestly and prudently invested." Inasmuch as the Federal Trade Commission held hearings and supposedly delved for facts, a statement to the effect that certain things are alleged about speculative fluctuations in prices ought to have been substantiated. Whether the commission is just to the holding company or not can be revealed only by reference to the complete report. Until that is printed and available, therefore, judgment must be held in abeyance.

* * * *

## *State Commissions Roused to Defend Themselves*

SENATOR WALSH of Montana, in arguing his case against public utility companies, holding companies and management corporations before the Senate committee on interstate commerce in Washington this week, was certainly not at his best, for if he then and there unbosomed himself of all he had in mind, the case against the utilities is not very strong. Although very little that is tangible was presented, it is nevertheless generally conceded that some sort of investigation will be recommended. What the extent and scope of it will be will soon be determined after all sides have been heard. That it will be thorough and economic in scope is perhaps too much to expect, but that it will be only mildly sensational has already been demonstrated. The investigation, it must be remembered, will start as an inquisition from above and not because of mutterings of discontent from the users of the service. Hence it will in all likelihood be lacking in popular appeal.

The attempt to prove that the ultimate consumer is unprotected from extortion because, as Senator Walsh contends, state public service commissions are not functioning effectively will probably be the rock on which any political investigation will founder. Although the commissions as a body were at first somewhat backward in their own defense, they discovered in Senator Bruce of Maryland a valiant champion. He was quick to disagree with Senator Walsh and contended not only for the integrity and probity of the commission of his own state, but also espoused the cause of untrammeled state regulation of intrastate utility service. The commissioners when they subsequently had opportunity to speak for themselves proved worthy of Senator Bruce's defense and made their own position perfectly clear. Thus it would appear that if Congress sticks to its last it will limit the Walsh investigation of utility companies to interstate commerce, and inasmuch as electricity and gas are for the major part consumed in the state where they are manufactured, any committee will have to watch its steps closely if it is not to encroach on the rights of the several states.

## *The New Phase in Co-operation*

FOR years electrical men have been talking about co-operation—as a theory and a principle. In fact, there has been so much talk that we are almost weary of the word. It would seem, however, that as a policy and a practice we are only now beginning to find the meaning of it all in any broad industry sense. This was the lingering impression that one brought away last week from the dinner to W. W. Freeman, when he received the medal for co-operation given under the James H. McGraw Award in recognition of his achievement in reorganizing the directorate of the Society for Electrical Development to represent officially the four major national associations and the leagues.

Owen D. Young crystallized the point in characteristic fashion when he said in his address: "Men work as individuals when they can. They co-operate when they must." And there one has the reason why in this electrical industry co-operation is right now apparently passing from its talking phase into a more purposeful phase of practical application. It is an intriguing thought. As Mr. Young pointed out, no man desires to co-operate until he is compelled to accomplish ends beyond his grasp as an individual. As far as he can he goes ahead alone. Then comes a time when to attain his aim he must have the help of others whom he cannot individually control. There is only one way in which he can influence them, and that is by the give-and-take process involved in co-operation.

The electrical industry has been following this very course. The onrushing growth of the popular demand for electric service of all kinds has brought great prosperity and opportunity. Power companies, manufacturers, jobbers, contractors and dealers have been able to go forward with their own plans in their own way. The co-operation that has been developed within the industry has been more social and fraternal than practical. But now comes a new era. The electrical industry at last begins to realize that it has a selling job to do and that in the great marketplace all electrical men must work together if they are to prevail against the strength of other industries. And so we see this reorganization of the S.E.D. and the convening of an industry sales conference, and a distinguished gathering pays tribute to the man who makes it possible. Co-operation is getting to its work.

* * * *

## *Communication by Sight and Sound*

RESEARCH work in communication has annihilated space and time. It is now possible to hear and see simultaneously independently of distance, and this laboratory accomplishment will become a commercial reality in a short time. The demonstration of home television by Doctor Alexanderson has followed as a logical step the spectacular television demonstrations of last year. It is true that the commercial application of laboratory results must await the solution of many technical and economic problems, but past experience proves that these problems will be solved.

The art of communication is developing very rapidly because of the advent of the vacuum tube and of other facilities introduced by radio inventors. New methods and better methods of communication may be expected, and yet the fundamental aspects of present services will remain. There need be no fear that the telephone and the telegraph will be relegated to the scrap pile, for they are essential. New equipments and new methods will be incorporated with these fundamental devices to give better service. Vision added to sound will make possible communication of a quality undreamed of in present commercial installations. The day approaches when people in any part of the world may see and hear people in any other part of the world. May not this in time result in the stabilization of world affairs and the creation of worldwide understanding?

* * * *

## *The American Engineering Council and Electrical Engineers*

ORGANIZED in 1920 for the purpose of making engineers articulate in public affairs, the American Engineering Council has not been so effective as it might be did it receive heartier and more devoted support. It has been handicapped, for example, by the refusal of the civil engineers to join with the other national bodies in making the council the point of contact between engineers and the federal government, thereby enabling the latter to obtain very much needed advice and factual information from disinterested rather than from interested sources, reliable as the latter have proved themselves to be. And yet, despite handicaps, the American Engineering Council has managed to build up an excellent reputation for performance and achievement. Its studies and reports on the elimination of waste in industry were noteworthy accomplishments, as were also the reports on Muscle Shoals, coal storage and the productivity of labor.

Most of our social and political problems are now economic in nature, and on such issues the engineer, with his bent for investigation and his analytical mind, is most competent to instruct and advise. That he has not done so more effectively or played a more telling part in political life is a reflection on himself and his profession. Certainly, opportunities innumerable abound, and government needs enlightened guidance. The cost of the Council is not very great, less than $50,000 a year, and that is spread over numerous national and local engineering bodies which compose the membership. More could be done if greater funds were available, but what the American Engineering Council covets first of all is the active interest of engineers everywhere in its work, together with their suggestions. Thus aided and encouraged, the work itself is sure to command financial support.

An electrical engineer has just been elected president of the Council, and while this fact does not take one ounce of responsibility from the shoulders of the other engineering professions, it is a challenge to the electrical engineers of the nation to uphold the faith the public has in their almost matchless and magical capabilities.

* * * *

## *The Demands of Tomorrow*

THE mutuality of interest between equipment manufacturers and electric light and power companies and the co-operation in research, design and development that has been evidenced as a result of this interest are the best assurance of continued progressiveness on the part of both groups. The advance that has been made is so amazing as to appear consummately successful, yet, at the same time, all the boasted efficiency and perfection of design is pitifully inadequate. Today's merits are tomorrow's shortcomings.

To look through the shadows of the future to the accomplishments of a new present is often, because of the variable and unknown factors of the physical, economic and social elements, a task impossible of accurate performance. Certain things may be taken for granted, however, with but little likelihood of ultimate discredit. It is the co-operative effort of manufacturers and utility men that will lead to the several solutions.

The unconscionable waste that carries 50 per cent of the heat in the steam into the discharge canal will be reduced to a major degree. The expenditure necessary to provide protection for equipment of all kinds against the weather through the provision of sheltering structures will be reduced. The devices for interrupting circuits will offer far better service, design and maintenance features than today's best accomplishments for achieving that purpose. The use of pole lines and open wire construction in city and suburban districts will become obsolete, and their discardment will take place without incurring the costs and complexities involved in present underground practice. The crudely laborious methods of testing meters will yield to machine-like accuracy of calibration and increased speed of adjustment. Motor characteristics will be varied to permit system power factors approaching unity with minimized deviation. Industrial plants, offices, homes and highways will be illuminated, not spot-lighted. The cost of the equipment necessary to provide service to an industrial customer will be curtailed by improved design and reduced requirements for apparatus.

The business of providing electricity for light, heat and power is only just entering the stage of simplification which follows the preceding eras of invention and development in the history of every engineering application. In general, there will be lessened complexity in types, quantity, size and installational requisites. Maintenance and supervision will be minimized in all apparatus characteristics. Costs will be reduced. It is as futile to discount the ultimately necessary thing as it is to deny today's inadequacies.

## *Industry Sales Conference Charts Its Course*

AFTER two months in which its six functional committees have been at work, the Industry Sales Conference held its second meeting last week to chart the course it is to follow in developing a sales program for the electrical industry. The first meeting merely analyzed the market problem and decided that a broad sales plan should be set up looking first to the development of the great market in the residence field now largely blocked by the inadequacy of house wiring. The reports of these committees are not yet released for publication in detail, for they have been referred to the executive committee of the conference for co-ordination and budgeting, but their general tenor has been announced. The conference will recommend immediate action in two directions:

First, a national movement of locally organized selling campaigns to merchandise the idea of adequacy in house wiring and to sell outlets and equipment for use in them, power companies to be responsible for local leadership, with the co-operation of leagues.

Second, a broad educational work among all contractors to promote better standards of estimating, cost keeping and business methods, that house wiring may be raised to a higher plane of competition for adequacy and completeness of equipment rather than by price paring.

The fact that these committees as well as the full conference itself are representative of the four major groups of the industry makes the work of this body of particular interest and portent. For the first time the entire industry is engaged in a commercial planning job. An embracive program is in the making that will present not only an opportunity, but a purpose, a plan, a proposed organization to do the work and a budget of expense, all carefully co-ordinated with the activities of other industry agencies. This sales program will be before the industry this summer and will undoubtedly receive searching analysis and criticism at the conventions. If the plan is good, this fall may see the start of a progressive market-building enterprise on a scale that will be new to electrical men. And present indications seem to justify the hope.

* * * *

## *No Further Need for Doubt*

MILLIONS of domestic users already connected to the power companies' lines represent, in the aggregate, one of the principal fields for future load and revenue. Very definite data taken from experience are presented in this issue of the ELECTRICAL WORLD by Harry A. Snow, who shows that there is no difficulty in greatly raising the national average above the present paltry one kilowatt-hour per day. He points the way to practical domestic load building with three of the major household appliances—the electric range, electric refrigerator and motor-operated oil-burning furnace. The data and conclusions drawn are based on a series of tests on typical installations in Detroit homes. Taking the average annual consumption of 540 kw.-hr. per residence customer in Detroit, the individual and collective effects of adding the electric range, refrigerator and oil-burner loads are shown. The results bring into sharp relief the conclusive evidence that residence consumption can be increased 50 to 500 per cent by the use of one or all of these devices.

Furthermore, the analysis of load characteristics shows that the use of these three appliances does *not* put excessive demands upon the power system, unduly increase the system peak or entail heavy investment in additional capacity. Quite the contrary is shown in fact. In the specific case of the electric range less than half the class demand of one thousand ranges comes on the system peak. The electric refrigerator has a most desirable yearly load curve, and the oil burner shows decidedly off-peak characteristics in its operations. The combined loads of these three appliances puts an entirely different complexion upon the domestic use of energy. Consumption per customer is increased from 540 kw.-hr. to 2,820 kw.-hr. per year, while the maximum demand per customer is only 913 watts and as a class the domestic user is operating at a 35 per cent load factor.

When it is considered that, as a group, a thousand domestic customers, each equipped with a range, a refrigerator and an oil burner, in addition to lighting and miscellaneous uses, have a maximum demand of only 913 kw. and will consume 2,820,000 kw.-hr. annually, the residence load becomes indeed attractive.

* * * *

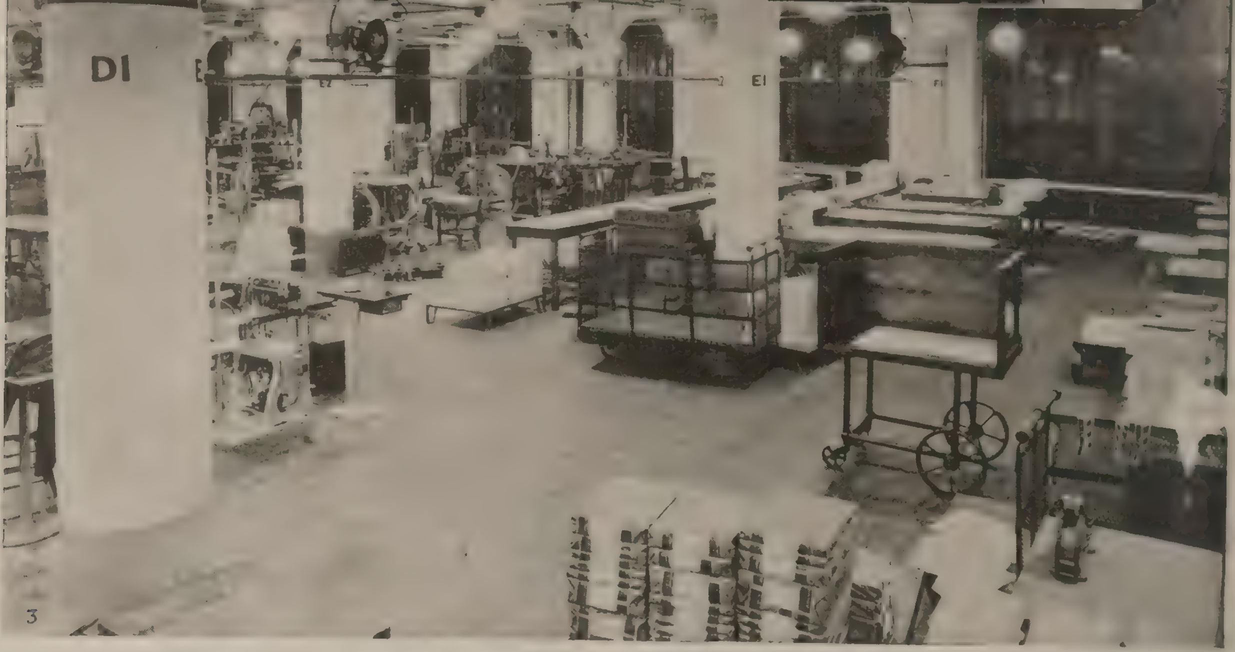
## *The Manufacturer in the Federal Trade Commission Report*

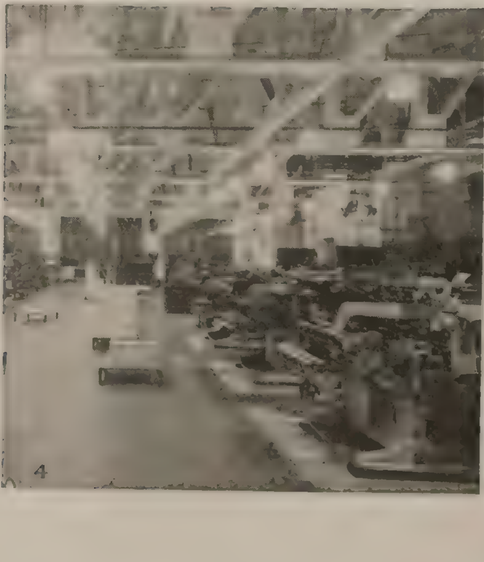
THE perennial debate on the relative positions of large and small manufacturers in the electrical industry will hardly come to a close because of the publication of a summary of the second section of the Federal Trade Commission's report on the electrical industry. But no one can deny that the opinion expressed emanates from an inquiry as neutral as could well be instituted, and as such the conclusions merit fair-minded consideration.

The report says that despite the permanent position of the three large manufacturers in the electrical market, the bulk of the business is being done by the small manufacturer; that though the prices of these large manufacturers are regarded by the trade as maximum levels above which others cannot hope to sell, it is the general belief among the small companies that the large ones compete actively in price, quality and service; that though the large companies "undoubtedly have the power to crush," this power has not been used in recent years, and that the elements in the competition of the large companies most difficult to meet are the lump-sum bid, the quantity discount and the consignment of motors. In the fractional-horsepower-motor field prices have been reduced to levels at which many have been unable to compete, but many state that "other small companies rather than the very large ones are their sharpest price competitors." The report justifies the direct inference that the general price policy of the large manufacturers is fair and that they have brought a stabilizing influence to the market. It makes particular point of the contributions to progress that have been made by the General Electric and Westinghouse companies through research. In conclusion the commission pays a tribute to the trade associations of the electrical manufacturers for the influence they have exercised in keeping the activities of the industry in line with the anti-trust law.

This kind of a pronouncement by this responsible governmental authority cannot be accepted as a complete answer to all questions as to the economic position of the small and large manufacturers in our industry. But it serves as a very definite brake upon the complaints of men who place upon the large companies too much blame for their own lack of success in the competitive market.

# *Correct Illumination Vital to Industry*





PROPER lighting is as essential to industrial customers as the adequate utilization of electric power. Production may be increased, material spoilage reduced and employee morale sustained.

An increase of production of 370 per cent is claimed through the installation of properly designed fixtures in a hosiery mill. A belting manufacturer raised his output nearly 20 per cent by an expenditure which, when reduced to a payroll basis, represented a cost increase of but 1 per cent.

No. 1. An excellent example of uniform lighting effect in silk mill practice.

No. 2. The lighting of this jacquard loom is indicative of the practice which requires illumination in both horizontal and vertical planes.

No. 3. The illumination of the warehouse and pressroom of this printing establishment is one of the best examples of uniformly distributed lighting in New England.

No. 4. Pressroom illumination must be of correct intensity and incorporate glare-free characteristics if quality and speed are to be maintained.

# High-Voltage Cable Problems

Heating and cooling stresses must be considered as well as electric stresses. Loss tests should be based on load cycles. Further data obtained regarding ionization phenomena

By T. N. Riley
*Cable Engineer, Standard Telephones & Cables, Ltd., London*

In testing materials subject to mechanical stress it has been well established for many years that a load that can safely be applied if steady may rapidly produce failure if variable, and many tests have been made to establish the safe stress for alternating loads of various kinds. In cable work, for example, a great amount of work has been done on lead sheathing to develop a type of sheath that will prove satisfactory in situations subject to vibration. In applying these principles to the cable dielectric, however, it is surprising that engineers have concentrated their efforts so greatly on one variable factor only and have relatively neglected a second and equally important one. They have, for example, studied almost exclusively the time for which a cable would operate without failure when subjected to alternating electrical stresses of different magnitudes and have neglected to take into account that under service conditions the applied current loading, and therefore the temperature, is also continuously varying. The results obtained under test conditions in which one factor only is varied may therefore be totally different from those obtained when the second factor is taken into account.

The heating and cooling of a cable in service may cause changes in the physical structure due to any one of the following causes: (1) Expansion of the compound leading to permanent distortion of the sheath in an initially well-impregnated cable. (2) Redistribution of the compound in the dielectric after expansion as in (1), particularly where the cable is laid on a slope. (3) Relative movement of the cores and filling or separation of the cores in a multi-core cable.

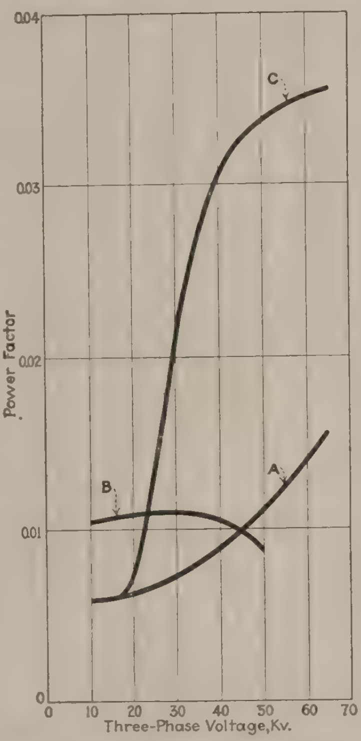


FIG. 1—BEHAVIOR OF A 33,000-VOLT CABLE OF THE BELTED TYPE DURING DIELECTRIC LOSS TESTS

Curve *A* shows the variation when first manufactured. Curve *B* shows results when the cable is heated to 70 deg. C. Curve *C* shows the power factor when tested after heating.

If the cable is to be satisfactory in service, its structure must be such that these changes cause little or no alteration in its electrical behavior, and the logical tests to apply are those that are most sensitive to such physical changes. Altogether undue emphasis has been placed on high-voltage tests, which are relatively insensitive to small physical changes and would reveal no definite deterioration except after such prolonged application of voltage and load as would be impracticable in a factory test. Moreover, to be effective, a pressure considerably in excess of the working pressure must be applied, so that the test no longer closely represents working conditions.

The dielectric loss test is much more sensitive to physical changes, and although such tests have been made, they have hitherto been directed rather to measuring the actual value of the losses under specified pressures or at specified temperatures than to measuring the variation of the losses produced by physical changes in the cable. In this respect current practice has reversed the real order of importance of the tests. It is admittedly desirable that the power factor should not be too high, but it is still more important that it should not increase in service when the cable is subjected to variations of load. In spite of this it is the exception in cable specifications to find any provision made for testing the power factor after one or more cyclic changes of load such as the cable must experience in service.

The behavior of a 33,000-volt cable of the ordinary belted type during such a test as is advocated is illustrated in Fig. 1. Curve *A* shows the variation of power factor with voltage when first manufactured. It will be noticed that up to double the working voltage the power factor does not exceed 0.015, so that the cable would pass any normal specification. A similar test taken when heated to 70 deg. C. (Curve *B*) shows a power factor below 0.011 up to 50 per cent over the rated voltage. This is again a satisfactory test, and as dielectric loss tests are usually carried no further, the cable would normally be passed into service.

If, however, the test is repeated on cooling after the heat run, Curve *C* is obtained showing a very marked increase in power factor over the initial value from the working pressure upward. Even then the power factor as an absolute value is not excessive, but the marked increase of loss after the heat run indicates that some change has taken place in the cable structure due to the load.

If this increase of loss is localized, it may represent appreciable damage to the cable at every period of cool-

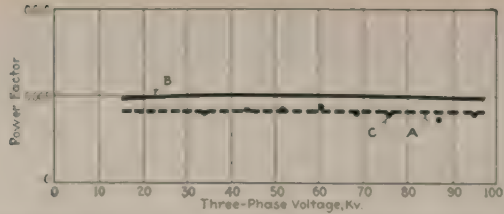

FIG. 2—TEST RESULTS ON A 33,000-VOLT H-TYPE CABLE WHICH HAS A STABLE CHARACTERISTIC

Curve *A* is immediately after manufacture. Curve *B* is the test when heated on load. Points on *C* are taken when the cable is cooled after heating.

ing on light load—damage that will be cumulative and will eventually lead to breakdown. It is known, for example, that most breakdowns of high-voltage cable for reasons other than mechanical faults have occurred during light-load periods.

The cable the test results of which are given in Fig. 1 would pass all normal tests in the factory, but would be unsatisfactory in service unless its normal load were so light as never to raise its temperature appreciably and in consequence never to cause the harmful physical changes. This would, of course, be an uneconomical condition of operation.

The test results on a cable for the same voltage which has a stable characteristic is shown in Fig. 2. As before, *A* is the test immediately after manufacture, and *B* is the test when heated on load. On cooling, again the values of power factor obtained at each voltage are practically identical with those obtained in the initial test—that is, are nearly constant at all voltages.

This indicates two things that are of importance in ensuring freedom from trouble in service: first, that the dielectric loss remains low both on load and on cooling without any progressive increases, and second, that there is no ionization and therefore no burning of the papers or oxidation of the compound to be feared in service.

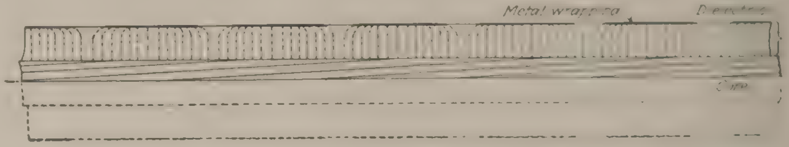

FIG. 4—DIAGRAM SHOWING EFFECT OF GAPS IN METALLIZED SHEATHING

### Type of Cable Effects Results

What type of cable will give characteristics of this order? In the first place, the flatness of the initial power factor voltage curve is typical of an insulation in which all stresses are radial—that is, of a single-core cable or the equivalent three-core cable in which each core has a metallized surface. If tangential stresses exist, the surface leakance current tends to increase more rapidly than the capacity current as the voltage rises and to cause an increase of power factor, which gives the power factor voltage characteristic a curve upward, even when there is no ionization. This is evident in the belted type of three-core cable, but is also indicated to a smaller extent in three-core cables having an equipotential sheath if that sheath is not continuous but is formed by spaced tapes. In this case the current paths from the edges of these tapes are tangential to the laminated insulation and the power factor is raised. This is illustrated in Fig. 3, where the spacing is exaggerated for clearness. The consequent rise of power factor is more marked at the lower frequencies, where the capacity current is smaller.

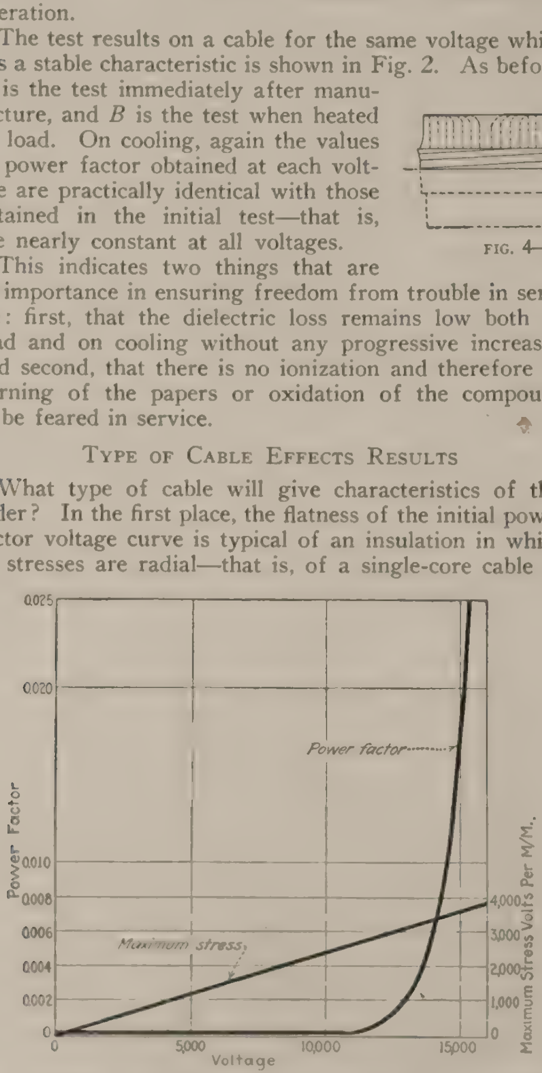

FIG. 3—POWER FACTOR-VOLTAGE CHARACTERISTICS OF UNIMPREGNATED CABLE WITH AN EQUIPOTENTIAL SHEATH

The dielectric must be free from all voids or air spaces—that is, it must be fully impregnated. If voids exist, then as soon as a certain stress is reached there will be an internal discharge across them, leading to a rapid increase in power factor. For cables up to 11,000 volts working pressure having the insulation thicknesses usual in English and American practice this ionization pressure is usually above the working pressure and even imperfectly impregnated cable will not give rise to trouble. Above this figure the higher working stresses necessary to keep dimensions reasonable render this immunity unattainable.

The power factor voltage characteristic of a cable made up with dry paper having no compound at all is shown in Fig. 3. It will be noticed that the power factor is exceptionally low up to the point at which ionization starts, and it then increases very rapidly.

It is necessary to choose suitable paper and compound and to dry them thoroughly in order to make certain that the dielectric loss shall increase very little with temperature. Residual moisture has a very marked effect in causing high initial power factor together with a rapid rise of power factor with temperature. This can, however, be eliminated by careful drying of both compound and paper under vacuum before they are brought together. It is also important in this connection to avoid exposure of the dielectric to the atmosphere after impregnation and before lead covering. The choice of a suitable paper and compound is a rather more complicated question. Take first the paper. Apart from its electrical characteristics, it must, of course, have mechanical strength. At one time only manilla papers were satisfactory in this respect, but at the present day chemical wood-pulp papers can be obtained that are equally satisfactory in this respect. The basic fiber is therefore of only secondary importance, and from a cable-making point of view the vital considerations are its structure, affecting its oil-absorbing power and dielectric strength, and its chemical purity, affecting its intrinsic power factor after removal of moisture. On both these points a large amount of research has been carried out in the Standard Telephones & Cables laboratories. Fig. 5 shows power factor temperature characteristics on a series of papers after subjection to equal drying. It will be noted that a large number have more or less similar characteristics, but of these only No. 18 is also suitable as regards absorption and dielectric strength.

It has been shown by Luigi Emanueli that the dielectric strength of paper is partly dependent on the air resistivity of the paper and that in general the dielectric strength increases with the air resistivity. This is true only so long as the higher air resistivity results from close packing of the fibers leading to a dense structure and not from extra beating of the pulp, which hydrolyzes the cellulose and gives a non-porous paper of the greaseproof type. The latter type of paper may have 25 per cent less dielectric strength than the former for the same air resistivity and thickness.

### EFFECT OF INSULATING OIL

In selecting oils three factors have to be taken into consideration: (1) The power factor-temperature characteristic when new. (2) The change produced on prolonged heating or subjection to electrical stress. (3) The viscosity as affecting the movement of oil in the cable in service.

Comparative power factor-temperature characteristics of a series of oils as supplied by the refiners, except that all have been vacuum dried, are shown in Fig. 6. All these oils are mineral oils having a petroleum origin, but the difference in behavior is remarkable. There is also a considerable variation in the quality of two consignments of the same oil as is indicated by the two curves labeled No. 10. There is a considerable need for further research on the part of oil refiners into the methods required to give good electrical characteristics, as little accurate knowledge appears to exist on this point.

The rate of deterioration of the same oils after heating for different periods in air at 100 deg. C. is shown in Fig. 7. It is noteworthy that the relative position of some oils is reversed after long heating, hence a low initial test is no criterion of suitable quality. The oils are not, of course, heated in air in service, but those oils the structure of which is likely to change when heated in air are also most likely to change on exposure to heat and electrical stress in service. It is also noteworthy that the change produced is in general irreversible: whereas actual carbonized matter can be removed by filtration or centrifuging, that factor which causes high power factor cannot be so removed and the oil appears to be permanently deteriorated (see Fig. 8).

The viscosity of the oil is very closely associated with the type of cable structure to be employed in insuring that the power factor-temperature characteristic does not change on cooling after load. If the complication of a hollow-core cable with standpipes and oil reservoirs is considered justifiable for very high pressures, a low viscosity is desirable, but if the normal type of solid structure is employed, the viscosity should be as high as possible, provided always that the actual setting point at which any change of state occurs is below the temperature at which the cable will normally be handled in manufacture and laying.

Up to the present the question of how to get a satisfactory cable up to the point at which its manufacture is completed has been discussed. Next to be considered is how it will behave on load.

When the dielectric is heated, the compound must expand, and in expanding it will expand the lead sheath. The latter is plastic, and as the cable cools again it retains its shape while the compound contracts, so that small voids must be formed inside the sheath. If these voids are subject to electrical stress above a certain value, ionization will occur and the power factor will rise. The narrower the spaces across which the potential is applied the higher will be the stress required to set up ionization. Hence the change of power factor is greater in the ordinary type of three-core cable, where the stress may at certain instants be along the layers,

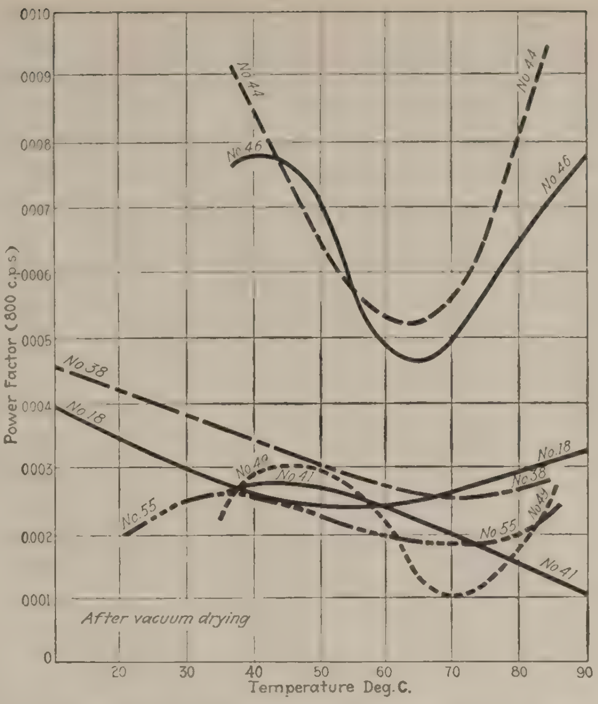

FIG. 5—POWER FACTOR-TEMPERATURE CHARACTERISTICS OF PAPERS

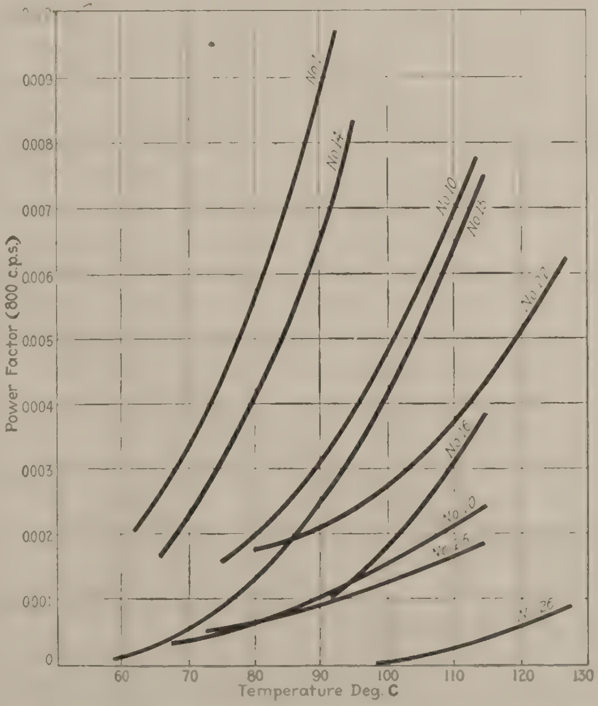

FIG. 6—POWER FACTOR-TEMPERATURE CHARACTERISTICS OF NEW OILS

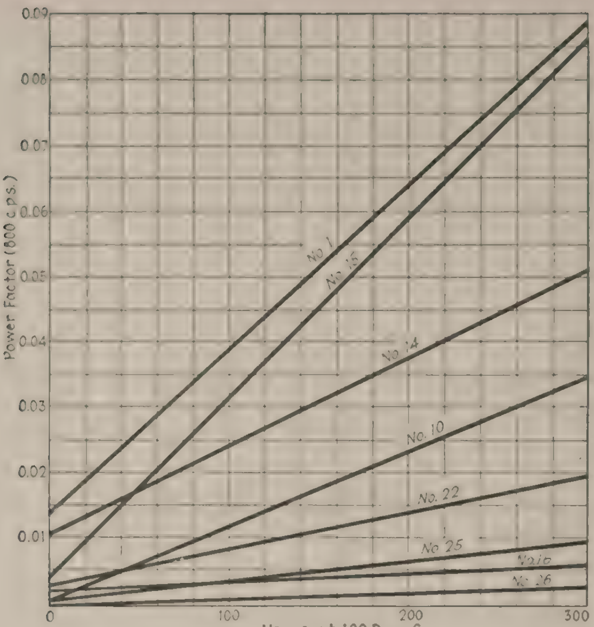

FIG. 7—POWER FACTOR-TEMPERATURE CHARACTERISTICS OF OILS SHOWN IN FIG. 6 AFTER HEATING IN AIR TO 100 DEG. C.

than it can be in single-core cable, where the stress is always radial, and the gap cannot be greater than the thickness of the paper employed. Single-core cables, in fact, show this phenomenon to only a small extent. To prevent it altogether some means must be found of preventing the formation of voids in the dielectric.

One method of doing this is, of course, to employ a hollow core or other oil duct in the cable together with a thin oil so that all expansion occurs into reservoirs at intervals and oil is supplied from these on contraction. This has been applied in some recent lines at exceptionally high pressures, and in such cases the necessary complication may be justified. Some attempts have also been made to apply it in cable of ordinary structure without a definite oil duct, reservoirs being provided at the joints. This is of very doubtful value, since the rate at which oil can flow along a tightly wrapped core is too slow to prevent local expansion if the cable temperature rises rapidly on a sudden increase of load.

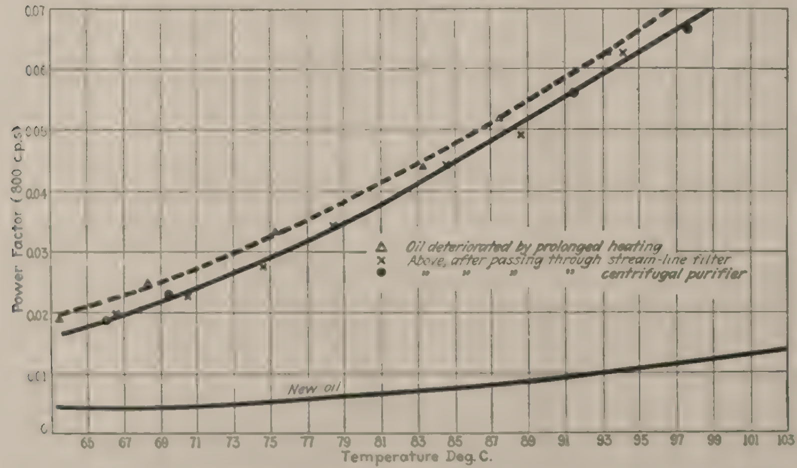

FIG. 8—POWER FACTOR-TEMPERATURE CHARACTERISTICS OF OILS AFTER VARIOUS METHODS OF PURIFICATION

If oil ducts are not used, the risk due to voids can still be eliminated if it can be arranged that they are formed in a part of the dielectric not subject to stress, as, for example, in the worming of an H-type cable having continuous metallized wrappings over the cores. As far as can be judged by experiment, this is actually what happens with such cables. The compound expands on heating and the lead is distended. On cooling, the core wrapping, which is denser and more highly absorbent than the filling, tends to retain the compound at the expense of the filling, so that any voids are formed in the latter where they can do no harm. The result is that the power factor characteristic before and after heating is unchanged and if initial impregnation is good it is independent of applied pressure (see Fig. 2). Such cables are giving satisfactory operation in service in cases where the ordinary belted type has failed, at a much less cost and complication than would be required to secure the same end by an oil-filled duct.

It should be noted that sheath expansion cannot be avoided by reinforcing it in any manner by an external armor. If the impregnation is initially complete, the extension necessary to provide the additional space required for the hot compound is well outside the stretch that can occur up to the elastic limit of the usual armoring materials. The distortion produced is therefore permanent even in an armored cable.

It is possible that in the future other methods of securing stability in service may be discovered, but whatever methods are employed, it will be necessary to add, to the tests used at present in the factory, a test giving a better criterion of stability in service. The comparison of power factor voltage characteristics before and after a load run affords such a test.

## Compressed Air Combats Anchor Ice

THE FORMATION of anchor ice in the Oswego River at the dam of a manufacturer thereon has been of such a serious nature at various times as to necessitate a shutdown of the plant for a considerable period. In an endeavor to correct and prevent this condition, the corporation, which now controls the water power rights in this river and supplies power to the manufacturer, has recently installed an unusual system for the disposal of anchor ice by means of compressed air.

The two dams belonging to the company have been equipped with this device and the satisfactory qualities in maintaining service at the intake have been demonstrated. The essential feature of the apparatus consist of heavy brass pipes imbedded in concrete near the bottom of the fore bay, through which compressed air may be released at intervals. One set of 4-in. extra-heavy brass pipes is located directly behind the trash rack and extends across the whole frontage of the refuse interceptors. Another series of pipes is located about 35 ft. upstream and 1 ft. above the floor of the fore bay and likewise extends across the entire distance. Compressed air under 100 to 155 lb. pressure is released by means of a specially designed pop-valve and the first rush of air contributes largely to the satisfactory displacement of trash and the breaking-up of the ice. The $\frac{3}{16}$ in. holes in the pipes are on $1\frac{1}{2}$ in. centers to allow the escape of air in several directions permitted by the embedded pipe.

Material raised from the bottom by the use of this equipment and ice floating on the surface of the water in the fore bay are permitted to discharge through a secondary spillway located at the side of the dam and extending about 6 ft. below mean water level. Heavier material which has been dislodged from sub-surface positions remains in partial floatation in the turbulent water and passes over this discharge passage. In operation, air is forced through the pipe at such time-intervals as may be necessary, according to conditions of temperature and refuse accumulation.

Because of the efficiency of this device in clearing up the conditions for which it has been designed, it is not necessary to have such a fine mesh or spacing for the bars of the trash rack. This enables a less expensive type of rack to be used and does not restrict the flow of water in the event of corrosion formation on the rods or bars.

## Costly Alterations Avoided by Use of Fan Ventilation

By Maurice D. Smith*

SOME difficult problems of providing adaquate ventilation in an underground transformer room were solved recently in a manner that may benefit others who encounter a similar predicament.

The transformer room, which was seven feet underground housed three 75-kva. transformers supplying a power load and two 100-kva. transformers in parallel, supplying a dense lighting load. Under normal operating conditions sufficient cool air would have been supplied through the manhole cover and entrance shaft, but all five transformers were carrying an overload. The power transformers were overloaded during the day. As soon as their load started to decrease the lighting load came on and continued the heat generating effect before enough cool air circulated and cooled off the room, walls, and power transformers. This process continued and maintained a high temperature in the room. As the time of day when the power and light loads overlap had not been reached, it was felt that steps should be taken immediately to prevent a transformer failure when the peak occurred. This, of course, would have meant a service interruption to several large customers.

The first thought was to provide additional ventilating ducts that would admit air to the transformer room and allow the hot air to escape through the entrance duct and manhole cover. This would have necessitated breaking the street pavement and building a duct from the bottom of the manhole to the curb line. But the expense was rather high and besides the entire system, including and adjacent to the transformer room, was to be connected to a network within a few months. This would involve the installation of additional transformers in a room near the one in trouble to feed part of the load now carried by it. The transformer capacity was to be reduced from 425 to 300 kva.

In view of these facts, it was felt that some temporary expedient should be adopted. Upon close investigation it was found that a spare 5-in. lateral duct existed, from the room to a nearby pole. The thought then occurred, "Why not utilize this duct as an exit for the hot air and feed cool air in through the entrance duct and manhole cover?" This was done, and the temperature dropped over 30 deg. F., giving a safe operating temperature.

### Forced Ventilation Used

The method employed was to extend the spare lateral ten feet up the pole and to connect the other end through a hose to a blower capable of moving 10,000 cu.ft. of air a minute. The blower was driven by a 110-volt motor connected to one of the lighting transformers in the transformer room. A cylindrical shaped tube of canvas was made, with wooden supports at each end to give it shape. This tube was inserted in the entrance duct up to within twelve inches of the floor. The air was sucked through the holes in the manhole cover down the shaft and then forced out through the lateral duct by the blower.

Recording thermometers installed for two weeks indicated that the proper temperature was being maintained for safe operating conditions. From then on it was necessary periodically to inspect the blower motor, to oil the bearings, and make sure it was still functioning. In this manner it was possible to save several hundred dollars that would have been expended for additional ventilating ducts that would have been required for a period of three months. Also, the public was saved the inconvenience of having the street open for a week while construction work was in progress, with the unavoidable amount of traffic hindrance at a busy street intersection.

## "Safety Net" Plan Produces Results

APPLICATION of a "safety net" plan of preventing accidents and finding the cause and remedy for accidents has met with decided success in the organization of the Washington Water Power Company, Spokane, Wash. Enlarging upon the recommendation of the State Department of Labor and Industries for safety inspectors, the Washington Water Power Company discontinued its former safety committee of employees and department heads. In its place, a central safety committee, composed entirely of department heads, was installed. Working with this new committee, a group of 32 safety inspectors keep in constant touch with safety standards of the company, each in his separate group. The inspector makes immediate investigation of an accident in his group and assists in fixing responsibility and in recommending remedies for the prevention of a similar accident.

The safety inspectors report to J. B. Fisken, safety engineer and ex-officio secretary of the central committee. "The 'safety net' has brought in better results than the usual plan of a safety committee," states Mr. Fisken. "We receive many more safety suggestions, and, by having department heads on the committee, better action is secured in getting them adopted. Further, we now have active, aggressive safety leaders in each important group of the organization, which covers sixteen counties in our territory."

The term "safety net" is original with the Washington Water Power Company as applied to the type of safety organization worked out in Spokane.

# Substation Motor Inspections

FIRST ARTICLE

By O. M. Ward

Assistant Electrical Engineer Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

FOLLOWING is the motor inspection report form which is used in substation maintenance work on the system of the Milwaukee Electric Railway & Light Company. Motor inspections are made monthly. This form is mimeographed on a sheet 8½x5½ in. In addition to provision for filling in specific information, the form includes certain notes for the guidance of the inspector. These notes are:

MOTOR INSPECTION REPORT

Station..........Motor Drives..........Date..........

Motor hp..........Volts..........Frequency..........

Field Connections..........Main Connections..........

Air Gap Top.......Bottom.......Right.......Left.......

A.C. Rings.......  .......Commutator..........

No. of Brushes Changed, including those changed since last inspection ..........

Brush Spacing..........Conditions of bearings..........

Was Bearing Oil Changed.........Ground Test..........

Starting Apparatus........Size of Protecting Fuse........

Was rotor removed for cleaning and painting..........

> "This inspection report is to be used for all motors except motors or motor generators.
>
> "By 'air gap right' is meant the right-hand side of unit when looking toward the motor from the end which gives clockwise rotation. Ground tests to be made with a voltmeter on 600-volt d.c. if possible. Give meter number, meter reading and voltage of test. This test to include armature, field and leads, unless otherwise stated."

Space is left on the form following the notes for remarks by, and signature of inspector.

# Structural Steel Installed by Welding for $79 a Ton

AN ANALYSIS of the cost of electric arc-welding on the Derry (Pa.) building of the Westinghouse High Voltage Insulator Company, presented by Gilbert D. Fish, of New York City, consulting structural engineer of the Westinghouse organization, before the Affiliated Technical Societies of Boston, indicates the advantages of this application of power. The Derry building is of mill-type construction, one story in height and covers two acres. The total steel tonnage was 337. The purlins were made continuous and designed accordingly, the saving in steel on this item paying for the extra welding with a good margin to spare. The detail design was of "stark simplicity," and the major structural items included 135 18-in. I-rafters on 30-ft. span and six 24-in. I, 115-lb. rafters on 52-ft. span. Each rafter was connected to the column at each end by a single side angle welded to the rafter before erection and to the column after erection. The welding of the angles to the rafters on the ground before erection permitted the shipment of rafters from the mill to the site as plain material, with ordinary mill tolerances in length. It is estimated that the Derry steel work cost about 12 per cent less than the alternative design for riveting. The cost analysis is appended.

ANALYSIS OF STEEL COSTS IN ARC-WELDED BUILDING

| Item | Estimate | Average Per Ton |
|---|---|---|
| Steel on cars at building .......... | $17.070 | $50.66 |
| Erecting and painting ............ | 6,232 | 18.49 |
| Welding and special engineering .. | 3,280 | 9.73 |
| Complete structure ............ | $26,582 | $78.88 |

APPROXIMATE SUBDIVISION OF ITEMS

| | |
|---|---|
| Plain material on cars at building, 200 tons at $42.20... | $8,440 |
| Fabricated material on cars at building, 137 tons at $63.00 | 8,630 |
| Erecting and painting, 337 tons at $18.49.............. | 6,232 |
| Ground welding, 858 ft. at $1.45.................... | 1,240 |
| Welding in place, 1,402 ft. at $0.88.................. | 1,240 |
| Welding sketches and special engineering.............. | 800 |
| Contract price ................................ | $26,582 |

# Short-Circuit Ratio Is Significant

By Leonard A. Doggett

Professor of Electrical Engineering Pennsylvania State College

THE short-circuit ratio of an alternating-current generator is defined as the ratio of two quantities, *A* to *B*, where *A* is the field current necessary to produce rated voltage on open circuit, and *B* is the field current necessary to produce full-load current on short circuit.

This ratio which has been used in connection with alternators for some years discloses much concerning any alternator. For the majority of alternators now is operation, this ratio runs from 0.5 to 1.4. A short-circuit ratio close to unity is very common in American alternators, while German and French machines are built with short circuit ratios as low as one-half. A low short-circuit ratio means a narrow air gap, less field copper, and, in general, a less expensive machine. Conversely, a high short-circuit ratio means a long air gap machine with good inherent regulation. Roughly speaking, the ratio of the weight of the rotor copper to the weight of the stator copper approximates the short-circuit ratio.

From the point of view of excitation, low values of short-circuit ratio call for a big percentage variation of field current as load comes on. Thus the exciter has a very large variable load, while, with high values of short-circuit ratio, much less change of exciter load is met. An analysis of some hundred alternators shows what may be demanded in a quantitative way of the exciter.

For unity power factor loads, the field excitation at no load will have to be multiplied by 1.9 to give rated voltage at full load, when the short-circuit ratio is 0.6; but only by 1.2 for a short-circuit ratio of 1.4.

For 80 per cent power factor lagging loads, the field current must be multiplied by 2.5 at full load for a short-circuit ratio of 0.6; by 1.5 with a short-circuit ratio of 1.4. Expressed as formulas, these results are

$$\frac{\textit{Field Amperes at Full Load}}{\textit{Field Amperes at No Load}} = \frac{K}{\sqrt{\textit{S.C. Ratio}}}$$

For unity power factor, *K* runs from 1.4 to 1.5.

For 20 per cent lagging power factor, *K* runs from 1.8 to 2.0. Of course, these results will be slightly modified by the saturation and leakage reactance of the particular unit under investigation.

A significant statement as to the trend of the short-circuit ratio may be found in the following quotation from page 1,248 of the November, 1927, A.I.E.E. *Journal*, as follows: "On account of the stability characteristics desirable for operation with a 220-kv. transmission line, the Conowingo generators have a short-circuit ratio of 1.25, which is somewhat higher than has been found satisfactory for nearly all other hydro-electric developments."

## Utility Research Indicates

# Appliance Load Values

Tests show electric ranges, refrigerators and oil burners of great potential importance in raising average annual consumption. Residence service can be made high load factor business

By Harry A. Snow

*Assistant Controller Detroit Edison Company, Detroit, Mich.*

THE average residence customer of the Detroit Edison Company is steadily increasing his use of electric service. In 1917 the average residence customer consumed 319 kw.-hr., whereas for 1927 this figure will be about 540 kw.-hr. In studying the very important problem of the possible continuance of the growth in residence consumption it was decided to determine the characteristics of electric service to three types of appliances, which are rapidly increasing in popularity but which are not yet in wide general use—namely, the electric range, the electric refrigerator and the electric motor used to operate oil-burning furnaces. The use of electric current in these three appliances is large as compared with the use of current in other appliances such as laundry irons, toasters or washing machines, which are used for only a few hours each month, and their effect on average annual consumption is of great potential importance.

Integrating watt-hour meters were installed on 53 electric refrigerators, 55 oil burners and 194 electric ranges located in single homes. The range meters carried demand attachments. Curve-drawing meters were installed on a limited number of refrigerators and oil burners and on three groups totaling 198 ranges located in apartment houses.

This special metering has made it possible to determine annual consumption, daily and yearly load curves, maximum demands, load factors and diversity factors for the three appliances. Special operating characteristics were also observed.

### Electric Household Refrigerators

In Detroit electric household refrigerators consume 34 per cent more current during the warm summer months than they do during the cooler winter months. For July, August and September, with a mean outdoor temperature of 68.5 deg. F., a group of 53 refrigerators, including eight different makes, showed an average monthly consumption of 51 kw.-hr., as compared with 38 kw.-hr. per month for December, January and February with a mean temperature of 27.4 deg. F.

Electric refrigerators consume a little more current during the daytime than they do at night, because of the higher temperatures generally prevailing during the daytime and because of the opening of refrigerator doors for the admission of food, etc. The daily load curves on 195 refrigerator motors, averaged together, gave an average consumption from noon until 6 o'clock at night 12 per cent more than the consumption during the hours from midnight until 6 o'clock in the morning.

It does not seem to be customary to shut off electric refrigerators during the winter months to save electricity by taking advantage of natural refrigeration. Only one of the 53 refrigerators under test was shut off for the winter. However, it does seem customary to shut off the refrigerator when the house is to be unoccupied for a time. During the summer vacation period the monthly consumption of individual machines under test was erratic, probably because of this fact. In certain specific instances it was known that the absence of the house-

holder on his annual vacation was the cause of abnormally low monthly consumption.

The average annual consumption of the group of 53 electric refrigerators, all of which were of a size suitable for use in an ordinary middle-class residence, was 542 kw.-hr. per year. The average electric input to the motors during operation was 249 watts. Of the 53 refrigerators, 32 were driven by $\frac{1}{4}$-hp. motors, 19 by $\frac{1}{6}$-hp. motors and two by $\frac{1}{8}$-hp. motors. This gives a weighted average motor rating of 0.216 hp. or 161 watts.

Recording instrument records indicate that the refrigerator motors were in operation on the average 24.9 per cent of the time. The operation of automatically controlled refrigerator motors is intermittent, but the load on the power station produced by a large group of refrigerators will be a steady load, except for the daily and seasonal variations heretofore described.

### The Refrigerator Load

A group of 1,000 refrigerators, similar in make-up to the group of 53 tested at Detroit and operating under similar conditions, would consume 542,000 kw.-hr. per year, with a maximum demand for the group of 89.3 kw. occurring on a summer afternoon and a demand on an assumed December peak of 55.4 kw. (at the customers' meters). This corresponds to an annual load factor of 69.3 per cent for the group and to a diversity existing between the individual members of the group of 2.80. A further diversity which amounts to 1.61 is found in comparing the group maximum with the assumed December peak.

The month-to-month records of the consumption of electricity by individual refrigerators show that consumption has a tendency to be somewhat erratic. In certain cases it was known that the refrigerator had got out of adjustment and was using more or less current than normal. Automatic control apparatus must be more dependable than it is at present to make the current consumption continuously normal to the refrigerator duty.

Electric motors for operating oil burners for domestic furnaces consume a maximum of current during the cold winter months and no current at all during the warm months of July and August. Tests on 55 oil-burner motors operating thirteen different makes of oil burners installed in Detroit homes showed an average consumption of 53 kw.-hr. per month in December and no consumption at all during July and August. The average consumption per motor for the year was 258 kw.-hr.

RELATION BETWEEN ENERGY CONSUMPTION AND NUMBER IN FAMILY

| Number in Family | Average Monthly Kilowatt-Hours | Number in Family | Average Monthly Kilowatt-Hours |
|---|---|---|---|
| 2 | 121 | 6 | 175 |
| 3 | 127 | 7 | 176 |
| 4 | 133 | 8 | 214 |
| 5 | 150 | | |

The daily load curves from curve-drawing meters on 205 oil burners, averaged together, showed a decided morning peak from 6 a.m. to 8 a.m. There was a much smaller peak at 7 p.m. and a period of relatively low consumption during the night. The morning peak was sufficiently high to reduce the daily load factor to the rather low value of 65 per cent.

The average annual consumption of electricity by the oil burners under test was 258 kw.-hr. Compared with the annual consumption of a refrigerator, 542 kw.-hr., or of a range, 1,480 kw.-hr. per year, the oil burner seems to be of secondary importance, but even at that, the addition of an oil-burning furnace will increase by 50 per cent the use of current by an average customer.

### Oil Burners Vary

The motor sizes for the oil burners under test ran all the way from $\frac{1}{12}$ hp. to $\frac{1}{4}$ hp. and the variation in consumption among different makes of oil burners showed as wide a variation. The average motor rating (on output) for the group under test was 140 watts, and the electrical input to the motors during operation was 172 watts. Since the load on the motors during operation is substantially constant, the kilowatt-hours consumed in a given month will be a measure of the number of hours during which the motor was in operation. The average motor was in operation 41.5 per cent of the time in December and not at all in August.

A group of 1,000 oil burners would consume 258,000 kw.-hr. per year. The peak load for the group would occur on a December morning between 6 and 8 o'clock and would amount to 116 kw. The group would be taking 58.6 kw. between 4 and 5 p.m. of the same day, a time which may be assumed as the time of the peak load on the system.

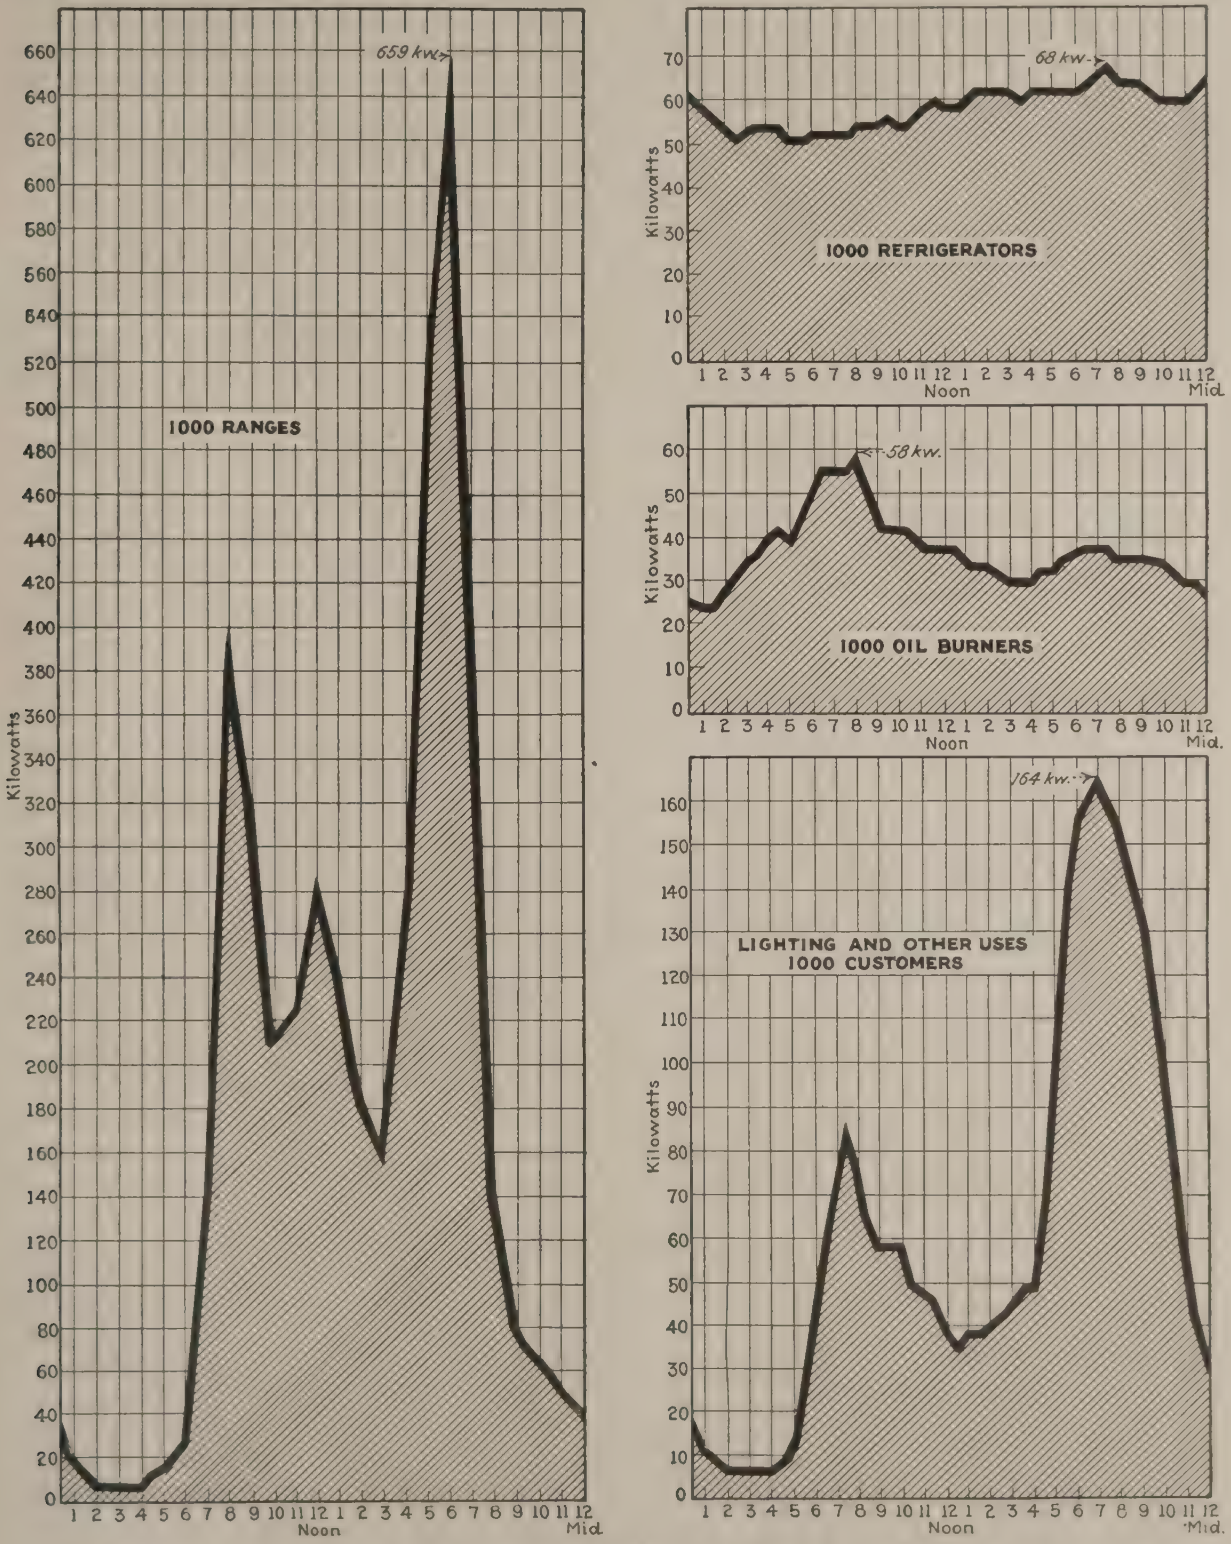
The annual load factor for a single oil burner is not high, 17.1 per cent, but the load factor for a large group is a little better, 25.4 per cent, because of the intermeshing of the demands of the individual machines.

Even during the time of the morning peak only about two-thirds of a large group of oil burners are simultaneously in operation, giving an individual diversity of about 1.5. The peak of the oil-burner load comes in the morning, and the afternoon demand is only about one-half of the morning peak. If it be assumed that the system peak comes at dusk of a December day, a large group of oil burners will have a diversity of about 2, as compared with the system peak.

### Influences of Weather

It is obvious that the electrical consumption of a large group of oil burners is dependent upon the outside temperature. Extreme cold weather increases the consumption and warm weather reduces it. The data given in this study are consistent with temperatures prevailing in Detroit during the past winter. The electrical consumptions of different designs of oil burners are markedly different, varying as much as 4 to 1 and the data given in this report apply only to a group embracing the same selection of burners as was made for this test. An attempt was made to have the group selected for test representative.

Domestic electric ranges consume a maximum of current in September (140 kw.-hr.) and a minimum of current in the short month, February (105 kw.-hr.), but the annual load curve does not show a pronounced seasonal shape. The total consumption for the year was 1,480 kw.-hr. Consumption tests were made on 194 ranges installed in single homes which averaged a little less than seven rooms to the house, and the results were modified after a study of the consumption shown by



*Composite Load Curves of 1,000 Residences Produced by Three Major Appliances and Lighting*

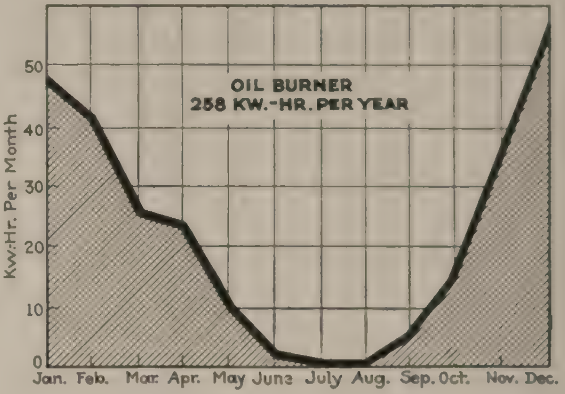
Range load produces three peaks, the greatest at the evening meal. Refrigerator load increases from early morning until after dinner, but is fairly uniform. Oil-burner load has its peak around 7 to 8 a.m., but is relatively high load factor. The peaks of the major appliances never coincide with one another or with the system peak.

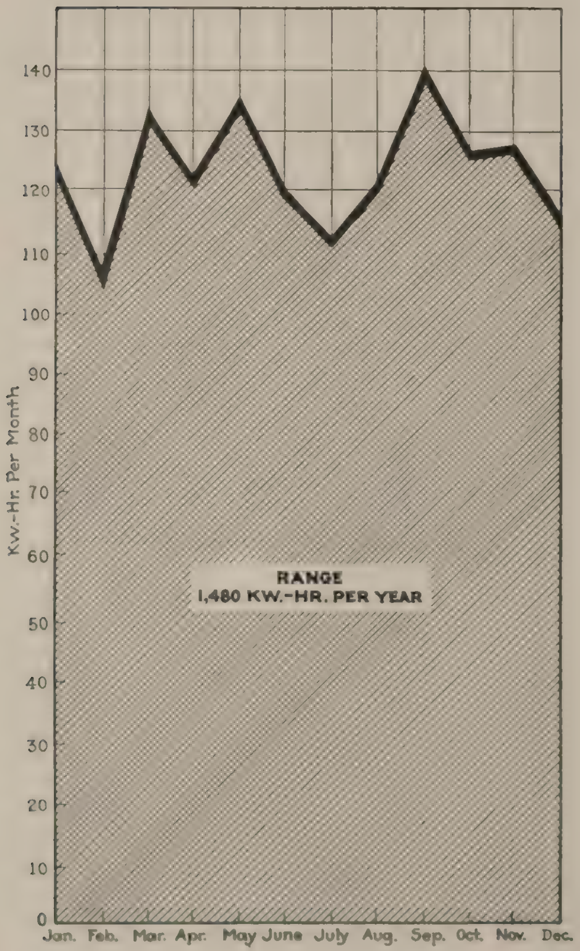
three groups totaling 198 ranges installed in apartment houses.

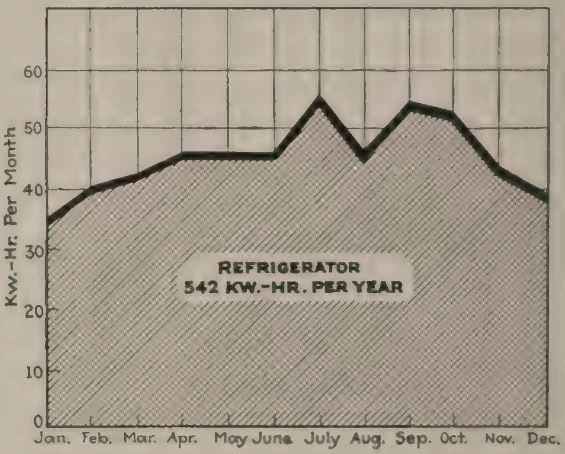
A study of 1,134 daily load curves from 198 electric ranges in apartment houses showed three distinct peaks corresponding to the three meals of the day. Of these, the highest peak occurred at the time of the preparation of the evening meal at 6 p.m. Rating this peak at 100 per cent, the breakfast peak at 8 a.m. was next in importance with 65 per cent and the noonday lunch peak, at 12 noon, was lowest with 47 per cent.

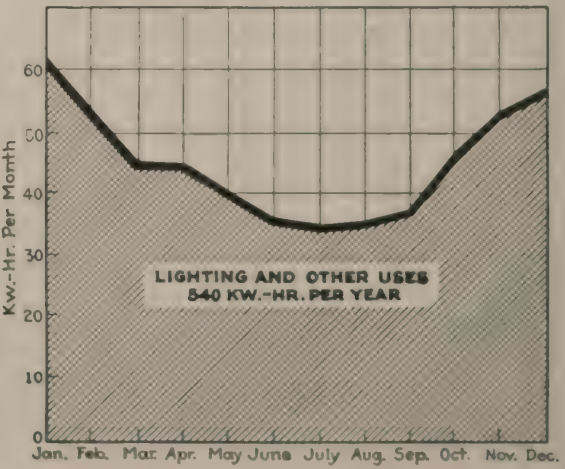
The load curve for Sunday was markedly different from the load curve for an average work day in that the peak came at 11 a.m. when the Sunday dinner was being prepared and this peak was apt to be higher than any other peak established during the week.

Peaks of current consumption by individual electric ranges are of short duration and erratic in occurrence. Maximum demand attachments on the meters installed on the 194 ranges in single homes showed readings of 5,200 watts per range as the individual maximum demand. The average individual demand of the smaller ranges in the apartment houses was somewhat less, an average for the large and small ranges being about 4,700 watts.







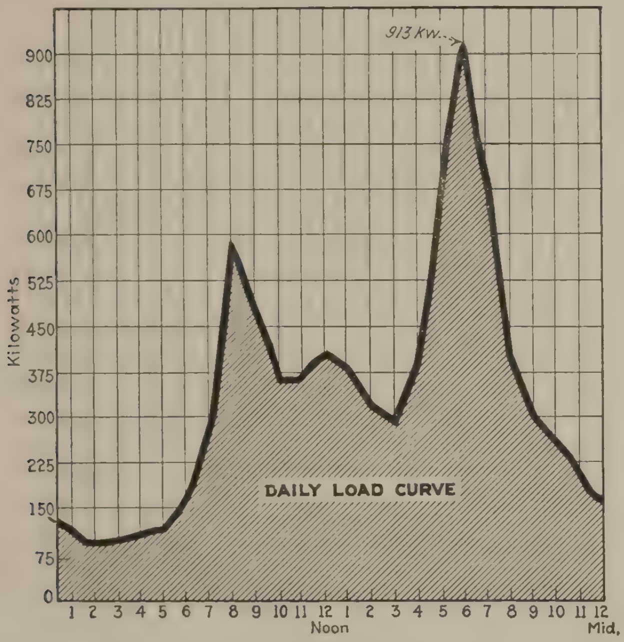


*Average Annual Consumption Produced by Range, Oil Burner, Refrigeration, Lighting and Small Appliances*

The range consumption varies between 105 and 140 kw.-hr. a month, dropping to its lowest mark in winter, almost an equal amount during vacations, with a smaller drop in the spring. The maximum occurs in the fall. Oil burners, lighting and miscellaneous uses have valleys that reach their lowest elevation about July, oil burners reaching zero at this time and lighting and other miscellaneous uses about half the winter consumption. Refrigerator consumption ascends during the summer, having a slight depression around vacation time.

A single range shows a high individual demand, yet because of the short duration and the erratic occurrence of range load peaks, the peak load of a large group of ranges will come down to 728 watts per range. This produces the high individual diversity of 6.46. Stated in another way, a group of 1,000 ranges will each, at one time or another, draw as much as 4,700 watts, but at no time will the 1,000 ranges, as a group, take more than 728 kw., or 728 watts per range in the group. This high diversity characteristic of range service suggests the possible economy of a distribution system having heavy secondaries and a few large transformers.

Range service as a class has its peak load in September, when the class load is about 17.5 per cent higher than in December and January. Also the peak load for range service comes at 6 p.m., a little later than the usual system peak, which is rarely later than 5 p.m. Assuming that the system peak occurs between 4 and 5 p.m. on some day in December, range service has a class diversity of 2.17 as compared with the system load. Thus, although each individual range at one time or another draws as much as 4,700 watts and a large group of ranges has a class maximum of 728 watts per range, the demand of a large group of ranges between 4 and 5 p.m. on a day in December is only 336 watts per range.



COMPOSITE DAILY LOAD OF 1,000 RESIDENCE CUSTOMERS
Using energy for lighting, range, refrigerator and oil-burning furnace.

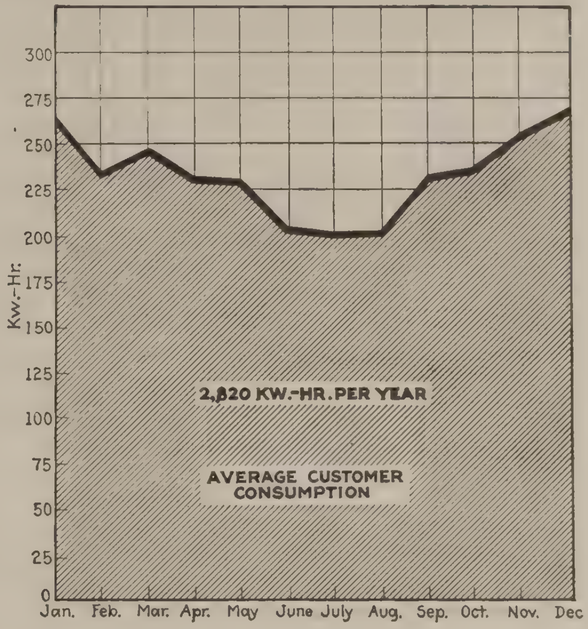
It is true that the annual load factor of one range is very low. A maximum of 4,700 watts and an annual consumption of 1,480 kw.-hr. produce a load factor of less than 4 per cent, but it is also true that a group of 1,000 such ranges has a fairly good annual load factor because of the high diversity among the demands of individual ranges. A class demand of 728 kw. (of which only 336 kw. comes on a system peak occurring between 4 and 5 p.m. on a December day) and an annual consumption of 1,480,000 kw.-hr. give an annual load factor of 23.2 per cent for the large group. Range service requires heavy distribution lines, but it is not so hard on substations, transmission lines and power houses.

In the case of the ranges installed in single houses the number of persons in each family was determined. The table on page 144 shows the relation between the consumption of current and the number of people in a family.

In general, it may be said that an electric range consumes 100 kw.-hr. per month plus 10 kw.-hr. per person for all of the people in the family served by the range.

The operation of electric ranges, unlike the operation of electric refrigerators and oil burners, is not automatic, but reflects the meal habits of the users of the ranges. The figures given are accurate for the single homes and apartments in Detroit.

The illustrations show daily and annual load curves for refrigerators. oil burners and ranges and for the use now made of electricity by the average residence customer in Detroit. The daily load curves are typical of the month of March, as being an average month where seasonal variation is present.



AVERAGE ANNUAL CONSUMPTION PER RESIDENCE CUSTOMER
Using three major appliances. Note comparatively small valley during summer months.

The data for the present use of electricity by the average residence customer do not quite represent use for lighting and small appliances only, because there are a certain number of the larger appliances in use, but the error made in assuming that these data do represent lighting and small appliance consumption is not of importance. Starting with the assumption that the average residence customer does not possess a refrigerator, an oil burner or an electric range and assuming further, rather fancifully perhaps, that he can afford to and does purchase a range, a refrigerator and an oil-burning furnace and so superposes their requirements for power on top of his previous requirements for lighting and other incidental uses, we arrive at the conclusion that the customer's consumption would be increased from 540 kw.-hr. per year to 2,820 kw.-hr. per year and that his daily and annual load curves would be as shown here. If all existing small customers were to be transformed into customers like this, public utility companies would have to look to their distribution systems, and possibly to their rate schedules.

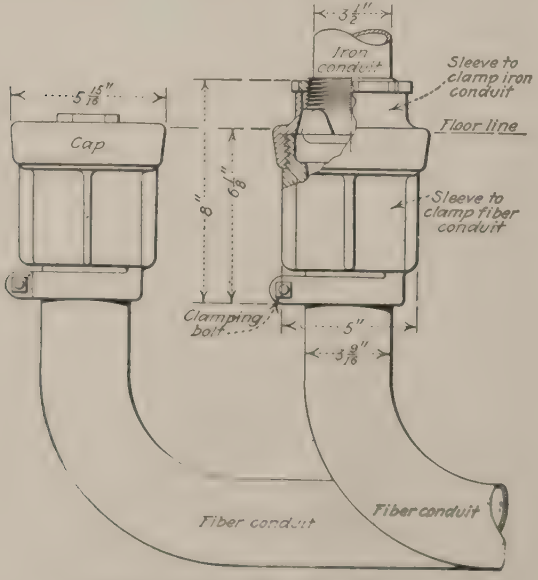
# Conduit Costs Reduced With Threadless Fittings

By Willis H. Backer
Assistant Electrical Engineer
Electric Bond & Share Company, New York

THE development of a fitting that may be used with fiber duct material and thus permit the substitution of less expensive construction for the commonly used iron conduit has led to major economies in the building of generating stations and substations, as well as in outdoor switchyards. Power and control cables, with the exception of single-phase alternating-current cables, formerly required iron conduit ranging in size from ½ in. to 4 in. The cost of engineering and construction of so many sizes of pipe offset the savings obtained through the use of the particular size required for power field leads, control, etc.

CONDUIT CONNECTORS INSTALLED, BEFORE POURING CONCRETE

In almost all cases the conduit is buried in concrete, so that the mechanical strength need not be great and fiber duct, which is less expensive than metal, may be considered for this duty. On some properties the engineers have standardized on 2-in. and 4-in. sizes. This permits savings in engineering costs, and the material may be obtained without delay and may be installed in the early stages of construction. For example, in addition to engineering cost reductions there is a saving in material costs.



A FIBER-TO-IRON CONNECTOR FOR 3-IN. CONDUIT

COMPARATIVE COSTS FOR IRON AND CONDUIT INSTALLATION

| | 2 In. | 4 In. |
|---|---|---|
| 1,000 ft. of iron pipe | $258.00 | $793.00 |
| 1,000 ft. of fiber conduit | 85.00 | 124.00 |
| | $173.00 | $669.00 |
| Fittings required: | | |
| 47 at $3.70 | $173.90 | ....... |
| 69 at $9.60 | ....... | $662.40 |
| | $0.90 | $6.60 |

# Intelligent Analysis vs. Expedients to Avoid Trouble

By G. B. McCabe
Technical Engineer Electrical Operating Department,
the Detroit Edison Company, Detroit, Mich.

IN ANY large operating organization, practices and methods grow up and are continued. Some may be good or bad; some may be the fruit of intelligently analyzed experience or the accumulated result of small carelessnesses. This condition has manifested itself numerous times on underground systems in which the handling of cable and the art of making joints and installing potheads have been transmitted from journeyman to apprentice without much supervision from technical authority, and in which the cable voltage has been increased in only comparatively small jumps. It is necessary that cable workers should be acquainted not only with the mechanics of good work, but also, in adequate degree, with the electrical conditions that are the reasons for those mechanics. It is quite conceivable that an apprentice who learns to make a good joint thinks he should not leave any sharp points of solder or loosely applied tapes because they spoil the looks of the job and are a disgrace to a good workman. He should know, also, that points of solder and soft insulation definitely weaken the joint.

In order to make such points as this clear to the men who do the actual work, the electrical operating staff of the Detroit Edison Company has prepared a lecture on underground cable which has been delivered twice to groups of operating and construction men. It was first given last spring to the 200 cable installers and splicers, and last December it was presented before 350 construction, operating and maintenance men, the majority of whom are directly concerned with the installation of cable terminals. The subject was covered exhaustively, from the manufacture of the cable to the last joint in the manhole. All details of installation, handling on reels, pulling in, joints, pothead terminals, etc., were discussed. The effects of short bends, of moisture on the hands of the splicer, of dirt on the insulating tape, of loose tape wrapping, of voids left in joints and many other points were demonstrated with high-voltage breakdown tests. Lantern slides illustrating both good and bad practices were shown.

It was felt that this information, presented in words, pictures and experiments, could not but have good effect, even in an organization where good workmanship is the rule and not the exception. This idea is borne out by the fact that there has been a diminution in the already small number of cable joint failures since the talk was first given last spring.

# "Caveat Emptor" Policy

## Suicidal if Applied to Investor*

Some tendencies on the part of investment bankers and utilities show disregard of the rights of the ultimate provider of necessary capital

By JOHN W. STEDMAN
*Vice-President Prudential Insurance Company of America*

THE annual aggregate permanent investment in public utility bonds of the life insurance companies incorporated in New York and New Jersey is so substantial a factor as to be worthy of being taken into account when drafting an indenture. Purchases in the years 1924, 1925 and 1926 totaled more than $360,000,000.

I am unfamiliar with the laws governing the investment of life insurance funds in other states, but I would direct your attention to the fact that the statutes of New York and New Jersey prohibit a company from entering into an agreement of reorganization without the approval of the Insurance Commissioner, the legislative intent being to control any change in the character of the company's investments. As the modification clause, which makes conditional upon the vote of a percentage of the bondholders, instead of unconditional, the promise in the bond to pay principal and interest on a fixed date, is, to repeat, an incipient reorganization in the furtherance of a compulsory debt-readjustment at some time in the future, it is apparent that the life insurance buyer of bonds which may be so modified, must, before confirming each purchase, obtain consent from the authorities at Albany and Trenton. Obviously, such a course of conducting one's business would be so grotesquely impracticable as to be out of the question.

*Much attention is paid to public relations between the utility and its consumers. Less is heard of public relations between a company and its shareholders. In certain respects, the latter relations are more important than the former.*

*The suggestions here presented by the representative of one of the nation's largest investors merit careful consideration both by the utility and by his banker.*

A discussion of the objections on the part of the investor to the modification clause, as used more particularly in public utility indentures, leads me to speak to you about another closely related matter, which, though understood by the lawyers who advise you, is, I have found, unknown to many of you. A bond in its form, that is, in the manner in which it is worded, may be negotiable or non-negotiable. Right here and now, please get rid of the commonly held but fallacious notion that a bond is a negotiable instrument merely because, being payable to bearer, it is transferable by delivery. Briefly, in the language of laymen, a bond, to be negotiable in form, must promise unconditionally to pay to order or to bearer a certain amount of money, with specific interest, on demand, or on or before a fixed date. Should there be in the bond any reference stating or implying a purpose to subject the bond to the terms of the mortgage or indenture, the unconditional character of the obligation is impaired and its negotiability destroyed.

You gentlemen and the borrowers of capital have been revelling for about two years in a sellers' market. In such a period it is not surprising that the strong wine of success and prosperity should go to your heads, making you disregard some of the reasonable needs of the investor, making you forget that the capacity of the buyer is not boundless and that his appetite can in time be dulled by constantly boosted prices. This was the reason for the painful attack of indigestion last June, from which the bond market did not recover for perhaps six weeks. Such a setback, it seems to me, should serve as a wholesome reminder to the banker who has heeded only the dictates of the borrower, and to the borrower who has taken a grasping and short-sighted position, that consideration for the requirements of the investor, especially the large long-term institutional investor, will, in the long run, prove best.

### DUTY TO BORROWER AND INVESTOR

In contrast to the selling-agency type of distributor, there are also some that feel that they owe one distinct duty to the borrower and another to the investor. Their duty to the former, they believe, consists in giving advice as to what form of financing should be adopted to preserve or enhance most effectively the credit of the company, in paying a price for the new securities which conscientiously measures the underwriting risk, and in fixing a redemption price which, taking into account the term and character of the obligation, will penalize neither the borrower nor the investor. Their duty to the latter they express very simply as insistence upon adequate protection, either in credit or in security, buttressed by the inclusion in the indenture of all legitimate provisions such as I have already described.

---

*From an address delivered at the sixteenth convention of the Investment Bankers Association of America.

On the subject of competitive bidding for railroad bonds and equipment trust certificates, it has occurred to me that you might be interested in learning the views of a professional investor on a large scale of collective capital, who has had the opportunity of watching the fate of all offerings submitted to him in different kinds of markets. In a weak and demoralized market, the borrowing corporation never realizes a fair price unless its banker comes to the rescue. In a slow and falling market, the successful bidder or group of bidders, having too narrow a margin of profit at even the very full retail price they fix, are not sufficiently fortified to hold this price in the face of a general decline; and, failing to make many sales because the investor is not attracted, they are forced to offer their holdings at lower and lower figures. The price or basis at which the bulk of the issue is finally disposed of is a false criterion of the railroad's credit, and as such injures the market for its securities. Needless to say, it is the large investor who, in picking up a bargain, rings down the curtain on a drama of melancholy futility.

### Price Depends on Market and Bidders

On the other hand, in an active and rising market, the bidders, time and again, pay approximately the price—and often above the price—at which similar securities are offered in small lots, in the expectation that in a few weeks an advance in the general level of quotations will reconcile the investor to paying the dealers' profit, and as often as not their expectations are realized. Not infrequently a dealer, either in the class I have characterized as consisting of those of various resources, who originate no business and may or may not employ salesmen, or in the class made up of those who are engaged in "hunting for investments for the investor," in a desire to control the marketing of a new issue, yet knowing the danger of operating on too narrow a margin of profit, will approach the large institution with the proposition that the institution become a silent partner by agreeing to buy a very substantial part of the issue at one-quarter of 1 per cent profit, but at a price or basis a little below the true index of the credit of the railroad. When it comes to determining what basis is indicative of the railroad's credit, one of two things always happens: either the dealer and the institution see eye-to-eye, in which case their bid is invariably topped, or they disagree, the institution dropping out and the dealer joining with others in buying the issue at a fancy figure. In either event, the large and careful investor is disappointed.

The trouble with the speculative or over-optimistic bidding obtaining in an era of intense competition is the resulting frequent failure to get a substantial part of the issue into the strong-boxes of permanent investors. To sum up then: it would seem that the interests of the borrowing corporation, and, to a lesser degree, of the investor, would be best served by limiting public supervision to the fixing of minimum prices and by allowing the borrower liberty in negotiation and the benefit of the judgment of experienced bankers. In function the banker is often likened to the distributor of the products of farm, factory, mill and mine; but is not such a conception superficial, in that it overlooks the fact that one who deals in credit is required to give advice and counsel? Competition in the distribution of a consumable commodity has its place in the economic scheme of things, but to compel the well man, seeking preventive advice or treatment or the sick man seeking a cure, to engage the doctor or surgeon who offers his services for the lowest fee, is manifestly preposterous.

In concluding, I might observe that the present practice of houses which originate new financing of allotting to the members of the selling group an aggregate amount of bonds considerably in excess of the face amount of the issue is both a confession of the speculative and temporary character of a substantial portion of the initial sales and an attempt to neutralize its effect by creating an artificial shortage to absorb the inevitable subsequent re-selling. Just how to discriminate, more successfully than has been done in many instances within the last year, in favor of the legitimate permanent investor is, I appreciate, a difficult problem. The firms in the fourth and fifth groups, which I have defined as those who originate no business but who may or may not employ salesmen, will not wish to have their profits decreased through curtailment of their allotments for the purpose of permitting the houses of issue to place larger amounts directly with the large investors. Yet might it not be feasible to arrange it so that the principals withhold for a week, for the account of each participant in the selling group, a certain percentage, say, 10 per cent, of his allotment, to be devoted to making sales to such investors? This suggestion has, perhaps, undesirable features, but are they not outweighed by the attainment of the end sought?

My parting message is that you be not content with a knowledge of the elements which go to make up credit and security, but make yourselves more familiar with the legal aspects of your business, which affect not only yourselves, the borrower and the trustee—your lawyers are sure to safeguard you and them—but also the investor.

---

## Have Put Houses in Order Financially

By J. F. Owens

Vice-President & General Manager Oklahoma Gas and Electric Co., Oklahoma City, Okla.

THERE IS every reason to believe that the marvelous growth of the electric industry which obtained in 1927 will continue throughout 1928. Many companies have taken advantage of the condition of the money market to put their houses in order financially and thus enter the New Year in splendid shape. It is evident that, while the industry as a whole is preparing to meet all demands that may be made for increased output and is in a position to finance improvements necessary to meet these demands, there is noticeably an abandonment of what, in some quarters, amounted to a somewhat reckless enthusiasm that, if continued, cannot but result in the payment of prices for properties that will be doubtful of justification, even by mortgaging future earning power. Altogether, I believe the industry is healthier and in a stronger position than at the beginning of 1927.

Much was done last year to acquaint the public with the basic facts of the industry, on the theory that the public is fair when it knows the facts. A vast majority of electric companies in the United States enjoy good public relations as a result of having continued a frank, open, above-board policy toward the public.

So thoroughly has this policy proved itself, that it is a rare thing to find a utility executive not following it. As long as our electric companies adhere to this policy there need be no fear for the future of the industry.

# How Standardization Procedure Affects the Industry

By A. Penn Denton
President Denton Engineering & Construction Company, Kansas City, Mo.

THE electrical industry is undertaking today a program in market building that will require the closest co-operation among all branches of industry if we carry it through to completion. This market building, while primarily a sales problem, has to do with the adequate rewiring of sixteen million homes which are now using electricity so incompletely. The National Electrical Code provides us with many types of interior wiring with which to wire these homes, but with all of these methods we have not reached a place in the development of our industry where it can be said we have no further need for progress in the art of wiring.

The electrical wiring standards of the present code have been 35 years in the making, and yet it has been only within the last four years that a procedure has been adopted by the industry whereby order has replaced haphazard revision of old standards and the making of new ones for wiring installations.

Our electrical industry has not yet realized the possibilities of this new procedure. It is still concerning itself with many old ideas and traditions in code making which should have been discarded years ago. Every type of wiring given us in the code today will prove helpful to our industry in extending our market for a wider use of electrical service. Our standardization procedure from this time on must protect each type of wiring according to its merits and at the same time permit of new developments and progress of the art. Under the old order of code revision the separate industry groups did not work together in providing the public with the best possible electrical service. For that reason many of the wiring standards of the code were too often commercial issues which seldom represented the best co-ordinated thought of our engineers and commercial men.

The basic factor underlying the standards for wiring installations of the code is safety from the standpoint of the fire and life hazards. No attempt was made for years to provide in the code due consideration for use and occupancy features of the different wiring methods. Rapid strides have been made in improving all kinds of building materials and construction, while those interests responsible for improved wiring methods lagged far behind other industry development. The public demand in all sections of the country for better and safer wiring has within recent years brought continually to the attention of our electrical committee of the National Fire Protection Association the need for recognition in the code of the "Where" and "How" all types of wiring may be used. The administrators of our code are asking for this treatment of future standards, while the manufacturers, the central-station companies, and the contractors are beginning to realize the great importance of such treatment.

We have, therefore, reached the place in our program for an orderly improvement in the revision work of the code, where each group of our industry must recognize its individual responsibility. Our interior wiring situation demands the co-ordinated efforts of all industry groups. The wiring standards must all be protected for the public good. This means that no group or single interest within a group may exploit some type of wiring for personal or selfish reasons. No one interest can control and it will be only through a united industry effort following the splendid procedure which we now have set up that will provide the safe, efficient and adequate wiring installations of the future so necessary to the success of our building the great future electrical market.

The electrical field service of the N.F.P.A. has accomplished much in the aid it has given the electrical committee, and particularly the article committees, but this field service work must be greatly supplemented by individual group action along these same lines. There is an immediate need for a code and standards staff in the National Electrical Manufacturers Association. The same need exists in the National Electric Light Association, the International Association of Electrical Inspectors and the Association of Electragists, International. All of the group staffs for code and standards work can materially strengthen the united and constructive participation of its own organization in bringing about an orderly control of our wiring situation for the good of all. All of these staffs need to be strong, friendly, courageous, far-seeing and free from bias toward or against any unit within their particular branch of the industry.

Let each group of our industry take unto itself the responsibility which rests upon it. May we frankly discuss these problems in our electrical field service committee for our common good. Then and only then can we hope to build that public confidence which, in the last analysis, is all important to the future expansion and growth of the electrical industry.

# Cost of Adding Coal Handling Facilities

THE INSTALLED cost of a coal-handling system added two years ago to an Eastern Tidewater central station has recently been itemized by the engineers of the public utility company for which the work was done. The major equipment consisted of an unloading tower of 300 tons per hour capacity, a 600-ton per hour Bradford breaker, a 36-in. Stephens-Adamson belt conveyor system, two 100-ton per hour bucket elevators and two 200-ton per hour Merrick weightometers. The overall capital outlay for this work totaled $233,467, as itemized in the accompanying table:

ITEMIZED COST OF COAL-HANDLING INSTALLATION

| | |
|---|---|
| Unloading tower, Boston Steeple tower type, Mead-Morrison 55-ft. boom, 375-hp. hoisting motor, 80-hp. trolley motor, 30-hp. propelling motor, 1.5 ton grab bucket | $60,003 |
| Bradford breaker, 125-hp. motor, breaker and cleaner type, complete with foundation, supports, and housing | 31,913 |
| Conveyors and weightometers | |
| 36-in. belt conveyor, 372 ft. c. to c., $\frac{3}{16}$-in. 6-ply belt, 36-in. Sacon carriers and returns, 30-hp., 550-volt, 3-phase motor with push button and station control | 18,924 |
| 36-in. belt conveyor on steel channel stringers, inclined type, 137 ft. c. to c., size as above, 50-hp. motor, 2,300 volts | 6,435 |
| 36-in. belt conveyor, 7-ply, dimensions as above but 572 ft. c. to c., 50-hp. motor, 550 volts | 31,656 |
| Two 100-ton per hour bucket elevators, vertical link belt type, 93.5 ft. c. to c., each complete with 25-hp. motor and two reciprocating type feeders driven by 10-hp. | 12,418 |
| 30-in. belt conveyor, 30 ft. c. to c., 5-hp. motor | 3,850 |
| 30-in. belt conveyor, 124 ft. c. to c., 15-hp. motor | 6,705 |
| Two 30-in. belt conveyors, 61.5 in. c. to c., each complete with 10-hp. motor and control, T-rail track, etc. | 9,545 |
| Two 200-ton per hour Merrick weightometers for 30-in. belt | 8,368 |
| Miscellaneous equipment | |
| Trolley and feed wires for raw coal handling equipment | 5,255 |

# Water Heating—Good Business or Bad Business?

By L. B. Hutton

***Chief Engineer Southland Electric Power Board,*** *Invercargill, New Zealand*

SUPPLY authorities are constantly looking for new sources of revenue from the sale of electricity. It is not long since they discovered the value of the electric range load. But, wherever an electric range is sold, there arises the question of an adequate supply of hot water. Any house can do without an electric range, but no household can be without its hot water.

What more natural, then, than that the question of heating water by electricity should today demand the attention of electric supply authorities, and the tendency seems to be toward an exploitation of this form of revenue. There is just a question, however, whether it is the supply authorities who are exploiting the field or the water-heating field that is exploiting the supply authorities. The danger lies in the fact that water heating demands a low rate. Electric power for water heating can reach the consumer: (1) direct from the authority which generates it; (2) from the generating authority, through another authority which purchases in bulk, and retails it.

ELECTRIC POWER COSTS

| Size of Element in Watts | Cost per Year | Cost per Day | Units Available | | Cost per Unit |
|---|---|---|---|---|---|
| | | | per Year | per Day | |
| 500 | $25 | 6.85 c. | 4,380 | 12 | 0.57 c. |
| 600 | 30 | 8.2 c. | 5,256 | 14.5 | 0.57 c. |
| 700 | 35 | 9.6 c. | 6,132 | 17 | 0.57 c. |
| 800 | 40 | 11.0 c. | 7,008 | 19 | 0.57 c. |
| 900 | 45 | 12.15 c. | 7,884 | 21.5 | 0.57 c. |
| 1,000 | 50 | 13.7 c. | 8,760 | 24 | 0.57 c. |

Dealing with the first of these, if we take as a basis that firm power cannot be made and sold at much less than $20 a horsepower-year—equal to about $25 a kilowatt-year—and assuming that this lowest rate is granted for water heating, we find that the consumer's cost, on the flat rate—that is, purchasing the kilowatt—works out at about 0.285 cent per unit. This would be an exceptional quotation, but even if he bought the kilowatt at $50 for the year, his water heating would cost only 0.57 cent per unit. One can imagine that so popular would this service become that the generating station would gradually be called upon to supply more and more of its power at an unremunerative rate, for, even at $50, the return per unit is far below what the average domestic service unit is sold at today.

The accompanying table sets out the cost per year, per day and per unit for power purchased on a flat rate of $5 per 100 watts per year. It cannot be claimed that the 100 per cent load factor, as represented in the "units available" column, is unattainable, because the large reservoir water cistern, properly lagged, lends itself particularly to the high load factor. No housewife can put a 100 per cent load factor on an electric range; but thousands are already doing it on the water heater.

Then there is the second case of the municipality which purchases from a generating station in bulk on a kilowatt or kilovolt-ampere basis—perhaps on a flat rate, perhaps on a sliding scale. This might take the form of so much per kilovolt-ampere for the first 1,000 kva. and a smaller sum for the remainder. If we assume that a municipality purchases in bulk at $50 per kilovolt-ampere per year on a half-hour peak demand, and that for a certain year its peak reaches 2,000 kva., then it has at its disposal 17,520,000 units, and it proceeds to sell them to best advantage. It will be unable to sell them all unless its system load factor reach the ideal of 100 per cent and its system power factor be high; but it will always be aiming at this ideal. Provided it does not exceed the 2,000 kw. peak, the unit cost is:

| | |
|---|---|
| At 100 per cent load factor | 0.570c. |
| 90 per cent load factor | 0.634c. |
| 80 per cent load factor | 0.713c. |
| 70 per cent load factor | 0.816c. |
| 60 per cent load factor | 0.950c. |
| 50 per cent load factor | 1.142c. |

At whatever point one may start, the load factor of a system tends to build up, and the unit cost will consequently fall. The retailing supply authority, watching its conditions carefully, can make such arrangements from time to time as will enable it to sell its 2,000 kw. of power over and over again and the time will come when it can quote an absurdly low figure for off-peak water heating.

So far as the generating authority is concerned, therefore, it has arrived at the same point as in the first case considered—that of supplying direct to the consumer on a flat rate—and neither of the pieces of business can be considered eminently satisfactory.

There are many cases where generating and supply authorities are cursing their long-time contracts at low rates. The rates have been far too attractive, and business which would give a much higher return has had to be passed by. There are also many supply authorities which are faced with the need for extending their plants, the attractive rates quoted having accounted for all their present capacity.

NOTE—Wholesale power at or near a generating station might, in some cases, be had at a figure of $20 a horsepower-year at 100 per cent load factor. But this represents the extreme case and does not consider the heavy investments and losses involved in transmission and distribution of small loads to water-heater customers scattered over a wide area. Rates would be much higher than those quoted and yet many properties find it possible to make a profitable rate for water heating and one which encourages this business.—EDITORS.

# Southern Cement Mill Electrified

ALTHOUGH it is the practice of many cement mills to produce their own power, since the enormous amount of available waste heat permits economical generation, the new plant of the American Portland Cement Company at Foreman, Ark., will, when completed, be electrified throughout and will use purchased power, according to E. W. Vennard, commercial manager of the Southwestern Gas & Electric Company. The initial capacity will be 3,000 barrels a day, with provision for increased production. A connected load of approximately 4,500 hp. will be composed of motors ranging from fractional horsepower equipment to 800-hp. synchronous machines driving the tube mills. Approximately 16 kw.-hr. will be required to manufacture each barrel of cement, a total of 1,440,000 kw.-hr. a month.

The cement company, through its contract for purchasing power from the Southwestern Gas & Electric Company, avoided a potential expenditure of some $500,000 for a power station at the plant and receives energy from the utility at a lower rate than the equivalent of private generation, even though the fuel charge be neglected in the computation of the latter cost. Sustained service is offered by the extensive transmission line facilities of the supplying utility.

# Improved Electrical Service

## in a Modern Shoe Factory

Plant of the George E. Keith Company illustrates latest practice in light, heat and power applications. Flexibility of operation assured by distribution system layout

By K. D. Hamilton

*Plant Engineer George E. Keith Company, Brockton, Mass.*

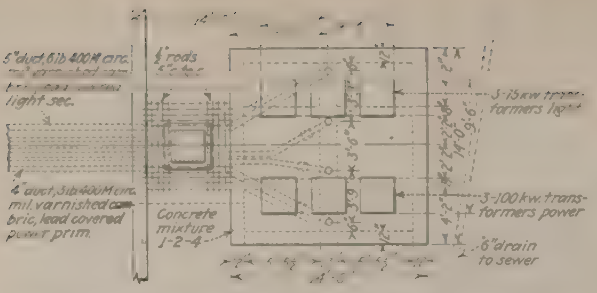
IN THE design of the George E. Keith Company's latest factory, designated as No. 11, at Brockton, the use of electricity was a dominant factor. For lighting and power service no other agency was open to consideration, owing to the well-known advantages of electrical illumination and the electric motor drive. Within the past decade the use of electric heating in specialized applications in shoe manufacture has attained remarkable headway, and this factory naturally affords many examples of this class of service.

The shoe industry has kept pace with developments in reinforced-concrete building construction, as appears from the accompanying illustration of Factory No. 11. This industry today appreciates the importance of investing in permanent construction, where maintenance cost can be reduced to a minimum and yet provide that flexibility of operation which is so imperative in shoe manufacturing, where styles are continuously changing, necessitating the removal of machinery from one portion of the building to another to keep pace with the ever-changing process that enters into the production of the shoe.

This factory (No. 11) differs radically from the ordinary reinforced-concrete building, although it has the appearance of a strictly concrete structure from the exterior, with the advantage of an extreme width of bay and window area, with exterior pilasters spaced 20 ft. apart on centers. The interior was designed to secure the advantages of slow-burning mill type construction, which allows a flexibility of movement of processes and machinery that is less apparent in a factory with concrete floors and large reinforced-concrete columns.

The interior posts are spaced on 10-ft. centers, the floor, however, consisting of 4-in. planks laid on heavy hard pine girders with an intermediate hemlock floor, topped by a high-grade factory maple wearing surface. This building is 400 ft. long by 60 ft. wide, consisting of four floors and a basement with a headroom of 12 ft. Its interior construction differs materially from that of the ordinary concrete factory, in that the wooden girders are hung from the concrete lintel by means of a special steel support. This allows us to obtain a maximum window area, throwing the daylight to the interior of the factory and allowing operators to use machines at distances from the windows that heretofore were considered impractical.

The shoe industry does not demand a heavy floor load, and for this reason the floors were designed to carry



5" duct, 6 lb 400 M circ.
light sec.
½" rods
4" duct, 3 lb 400 M circ. mil. varnished cambric, lead covered power prim.
Concrete mixture 1-2-4

3-100 kw. transformers power
6" drain to sewer
14'-0"
9'-6"
3'-6"
14'-0"

DETAIL OF TRANSFORMER PLATFORM FOUNDATION WITH PRIMARY AND SECONDARY CONDUIT LINES

only 125 lb. per square foot. In addition to obtaining a light floor load, the wooden construction lends itself admirably to securing machines to the floors and to the boring of holes for piping. It also facilitates the movement of machinery. It eliminates the hard concrete floor, which does not provide an ideal working surface; does away with the noise and vibration that are so apparent with high-speed machinery on a concrete floor, and above all, provides a clean, smooth wearing surface, which is not continuously being disintegrated by pushing trucks over concrete. It also eliminates the dust that is frequently apparent where many racks are moving in a reinforced-concrete factory.

### Energy Consumption 2.57 Kw.-Hr. Per Pair Shoes

These features as briefly outlined tend to provide conditions wherein lighting costs are extremely low. Lights are used in this building only during extremely dark weather or in the winter, and then only for a few hours in the afternoon. The average energy consumption for heat, light and power in this structure, when operating at a capacity of 3,000 pairs of shoes per day, is 350,000 kw.-hr. per year. The electric service layout in this factory, as well as the machinery installation, is designed for a maximum capacity of 6,000 pairs per day, and under present operating conditions 450 male and 430 female operatives are employed. When operating at maximum capacity, this number of employees would be increased to approximately 1,200.

At the Keith company's steam plant switchboard connection is made with the system of the Edison Electric Illuminating Company of Brockton through a substation supplied by the latter. From the buses of the Keith board an 800,000-circ.mil steel armored cable 800 ft. long serves the factory, terminating at a main distributing switchboard in the basement of this shop. Energy is supplied to the factory at 600 volts, three phase, and the general scheme of electrical supply is shown in the accompanying diagram.

In this factory larger motors driving auxiliary equipment are supplied at 550 volts; motors used in individual driving of shoe machinery are rated at 220 volts, and lighting is at 110 volts, three phase. The lower voltage was used on the shoe machinery on account of the hazard 550 volts presents to the employees. The transformers required for 220-volt and 110-volt service are located in an inclosure in the mill yard, the primary and secondary connections being run in underground cable between the factory distributing board and the inclosure.

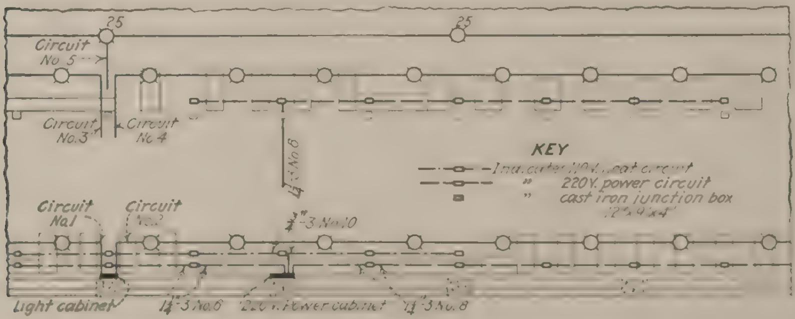
### Distribution Panels Centralize Control

The distributing switchboard has one incoming line panel controlling the main feeder into the building and is equipped with a voltmeter, a 500-amp. oil-circuit breaker, relays and watt-hour meter connections. A second panel controls a 550-volt auxiliary power feeder supplying energy to elevators, an air compressor, exhaust fans, etc., and also controls a feeder running to the power transformer bank primary terminals. Two 300-amp. oil-circuit breakers are in service on this panel. A third panel controls a feeder running to the lighting transformer primaries and a spare circuit for future additions. The remainder of the board is made up of panels controlling the 220-volt power and 110-volt lighting internal distribution feeders. Each panel is equipped with indicating as well as recording wattmeters to facilitate checking the amount of energy used and the loads in various departments and sections of the factory.

The lighting service is distributed throughout the factory at 110 volts, three phase, each circuit being balanced equally to obtain a uniform load on each phase. The transformers for these circuits are located on a separate foundation outside the building inclosed in a safety fence so that this hazard could be eliminated from the factory. These transformers consist of three 100-kva. single-phase transformers for the 220-volt power circuit fed on the primary by three 400,000-circ.mil cables, leading to them from the factory distribution panel, and have a secondary connection to the factory cables of six 500,000-circ.mil cables connected in parallel to give the necessary capacity.

The lighting transformers consist of three 75-kva. single-phase units fed by three No. 2 primary circuits and delivering to six 400,000-circ.mil secondary circuits. All of these lines are run underground in lead-covered cable, incased in conduit.

The wiring distribution throughout the entire factory is of the most modern type, all wires being run in conduits. Each feeder panel in the various departments controls the circuits to the motor equipment. These circuits are carefully designed to reduce voltage drop and to make the system as flexible as possible. A series of outlet boxes is provided at intervals of 10 ft., in order that future connections may easily be made from the individual machines. Each motor feeder panel controls a separate circuit in each department and a separate meter records the amount of power fed through that respective panel. These motor feeder panels



TYPICAL LAYOUT OF POWER AND LIGHTING CONDUITS

This drawing shows control of six main lighting circuits from lighting cabinet, and two power circuits and one heating circuit from power cabinet. Main units, R.L.M. reflectors, 150-watt lamps; watchman's circuit with dual control from ends of shop, 25-watt lamps and Alba shades are distributed at frequent intervals throughout the factory in order that they may be accessible at all times for future extensions, and several spare circuits have been left in each.

Circuits of 550 volts were chosen for the power tables because in this case the group drive was decided upon. These power tables are short benches with six sections each, with a machine set on each individual section, driven from a small shaft supported from the table frame in ball-bearing hangers. Each table is driven by a $\frac{3}{4}$-hp. motor through a chain drive to a sprocket on the shaft. These chain drives operate in oil at all times, which gives reduced maintenance cost and ease in the distribution of power. It eliminates belts and provides a drive on short centers, which conserves floor space.

The switching apparatus for the various motors de-

SCHEME OF ENERGY SUPPLY TO FACTORY NO. 11

pends entirely upon the circuit. Individual equipment on the shoe machinery itself is controlled through a simple snap switch at the will of the operator. The power table benches are operated by an oil switch located under the bench. Each switch controls an individual motor. Care has been taken to safeguard all equipment, by thoroughly grounding the various circuits and eliminating any possibility of breakdown of the electrical distribution. Overload coils and no-voltage release attachments are provided on all motors over 7½ hp. in capacity, so that they receive adequate attention in case of interruption of service.

The size of the motors throughout this factory is extremely interesting, as the shoe machinery is of light construction and the rated horsepower capacity of each motor is relatively small. There are 220 motors driving individual machines with a rated capacity of 252.75 hp., bringing the average to approximately 1 hp. per machine. There are 116 fractional horsepower motors with a rated capacity of 21.69 hp. These motors run from ⅙ hp. to ¼ hp. capacity and are served from both 220-volt and 110-volt circuit. There are eight motors operating for service equipment at a capacity of 152.5 hp., making a total of 344 motors with a rated capacity of 426.94 hp. The installation of individual motors on each machine makes possible the lighting distribution system which we have in this factory, as it eliminates all overhead belting, shafting, hangers, pulleys, etc., which, as any operating man knows, detract from the penetration of light to the interior of the factory. The individual drive also allowed us to place machinery in the interior of the mill, which otherwise would have been impossible. The maintenance of these motors has required considerable study, but has been worked out in a most satisfactory manner. One might ordinarily expect, with 344 motors to maintain, in addition to about 700 in other parts of these factories, that the bearings and lubrication used and motor winding breakdown would be excessive. The secret is that the motors are thoroughly cleaned and oiled at least once a week, that no motor is seriously overloaded, and that fuse conditions are so designed that adequate protection is available for all motors at each instant.

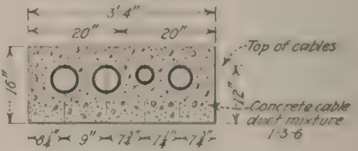
DETAIL OF POWER CABINET, WITH SWITCH AND METER MOUNTING

In designing the power table drive, it might be interesting to know that in laying out stitching machinery of this type, we rate a motor as follows: The first horsepower will drive eight machines, and if additional machines are attached to the line, the next horsepower will drive ten sewing machines. In other words, eighteen machines require 2 hp. and each additional ten machines require 1 hp. additional.

The motor equipment for individual shoe machinery requires intensive study, as there are innumerable machines used throughout a shoe factory. The capacities of these motors run from a fractional horsepower of 0.02 to the larger sizes, which require at least 3 hp. The speeds of these motors vary, depending upon the application of the motor to the machine. Standard sizes, however, are adopted as much as possible, using 1,200 and 1,800 r.p.m. synchronous speed wherever practical.



DETAIL OF CONCRETE CABLE DUCT BETWEEN TRANSFORMER BANKS AND FACTORY NO. 11

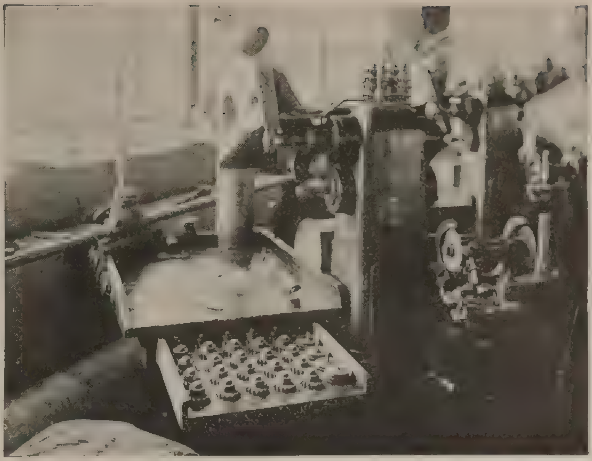
These motors are usually directly connected through a flexible coupling or by means of a chain belt or gear drive. Where the chain or gear drive is used, they are usually inclosed in a housing, which allows them to operate efficiently in a lubricating medium. The voltages vary to meet each factory condition.

The writer would recommend, however, that 220 volts be adopted as standard for all individual motor applications, and that 110 or 220 volts be used for heating circuits. The selection of equipment in this factory naturally brought up the question of the individual as compared with the group drive. The writer made an extensive study of the qualifications of both methods and found that each problem is an individual one for decision. In order to meet this problem accurately and satisfactorily, it is necessary to lay out a factory under both methods, estimate the cost of the installation of shafting, pulleys, hangers, belting and large motors, and compare them with the wiring, switches, installation and cost for individual motors.

There are other phases, however, that must be discussed: First, the type of machine to be operated. Is it one that is under continuous power, operating the entire length of the working day without interruption, or does it have an intermediate load that requires switching from continuous to intermittent operation? Second, can the machines be grouped so that one group can be operated continuously? Are the maintenance costs of repairing large motors, belting, shafting, hangers, pulleys, etc., greater than the maintenance costs of smaller motors? The diversity factor in the operation of a group drive is also an item for consideration.

The efficiency, as regards electrical characteristics, of a series of group motors of large size driving many ma-

PROTECTIVE MOUNTING OF POWER AND LIGHTING TRANSFORMER BANKS



ADJUSTABLE LIGHTING OF EDGE-TRIMMING MACHINE BY FLEXIBLE BENCH ARM UNIT

chines no doubt is considerably better than that of smaller motors. The power factor of several large motors operating at full load is also higher than that of many small motors operating under a similar condition. These items must be weighed carefully before making a decision. On the other hand, there are advantages of the individual motor over the group drive, such as flexibility of installation and the possibility of turning a machine at an angle with the line of the building so that the light may be focused directly against the point of operation, which would be impossible with the belt drive, because the machines must be either parallel or at right angles with the line shafting.

The reduction of light throughout the entire mill by the use of overhead equipment has a direct bearing on the choice of the individual motor drive. Then again, there is the matter of breakage of machine parts, which does not occur so frequently with the individual motor, especially on high-speed machinery. Should a machine break down with an individual motor, the fuse which is set exclusively for the motor capacity will blow and shut the machine down. With a belt drive, however, a large belt will frequently pull the machine over and cause additional damage. It is only by carefully weighing one condition against the other that the industrial engineer can decide which is the better method of distribution. Each problem is individual; frequently it is found in certain industries that the utility, flexibility, type of load, etc., may more than offset reduced efficiency and low power factor.

There is a solution, however, in the shoe factory, as in many other industries, for lower power factor, and that is by installing corrective apparatus, such as synchronous motors or static condensers in the line to build up power factor. One of the most satisfactory methods is to drive the large exhaust fan with a synchronous motor. The exhaust fan is a steady load and frequently represents 60 per cent of the entire load in the shoe factory because of its capacity. By installing a synchronous motor on the exhaust fan, ideal conditions are obtained for improving power-factor conditions, especially when a penalty clause may exist in the contract for purchased power. This assists in operating a privately owned generating plant by reducing copper losses and lessening the operating load on the generator.

### Illumination Involves Unusual Problems

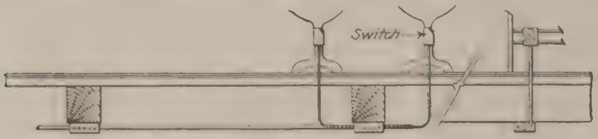
Another interesting feature of the modern factory is the lighting system. Those familiar with shoe factories appreciate its importance, but how many such plants are inadequately lighted. Many shoe factories are low studded; the ceilings are not painted white; belting, pulleys, hangers and other equipment interrupt the flow of light from the exterior. The factories are dirty and the machines are not placed in such a location as to obtain adequate light on the point of operation. All of these items were taken into consideration when designing this factory. With high headroom, white ceilings and elimination of obstruction of flow of natural light,

THE 900-KVA. SUBSTATION OF THE EDISON ELECTRIC ILLUMINATING COMPANY OF BROCKTON, WHICH SERVES THE GEORGE E. KEITH COMPANY

TYPICAL LIGHTING INSTALLATION, KEITH SHOE FACTORY; ALL OVERHEAD BELTING ELIMINATED BY MOTOR DRIVE LAYOUT

the machines were placed in such a manner that maximum intensity of light comes at the point of contact, and the overhead system of distribution was used throughout.

With 12-ft. headroom, it was possible to space R.L.M. reflectors with 100- and 150-watt units at sufficient intervals to eliminate shadows and provide adequate foot-candles at the point of operation. We eliminated all drop cords and the high maintenance cost which goes with such an equipment. This method distribution was used throughout all departments, except in those operations where high intensities were required, such as hand work in the cutting department and in the fitting room on the sewing machines. Here individual lights were used throughout, but of the more modern design which employs a flexible arm supported from a bracket on the bench. These individual lights were of 10-watt capacity on the stitching machinery and 25-watt capacity in the cutting room. This gave adequate illumination, and in some cases as high as 10 or 15 foot-candles were required on the work. This may seem excessive, but where high-grade quality work is demanded, sufficient illumination is imperative.



METHOD OF RUNNING POWER AND HEATING CONDUIT TO MACHINES

MOTOR RATINGS FOR INDIVIDUAL SHOW MACHINERY DRIVES

The manner of distribution of this lighting service is unique in that it is controlled from a central feed panel on the main switchboard to distributing panels throughout each department. In this way the foreman of each room has control of his lighting system and can operate it economically. It is not subject to the whims of each individual operator. In determining the intensity of illumination required at the point of operation, tests were made in other factories and the system was designed to meet these operating conditions. The overhead system has worked out satisfactorily and has reduced maintenance costs in comparison with the use of individual drop or flexible arm units. The maintenance of this system reduces itself to cleaning reflectors and lamps, adjusting fuses and inspecting distribution panels at regular intervals or as necessity may demand.

# Industry Active in 1928

### Review of business paper editors finds conditions sound. Intensive selling and lower production costs are chief factors in situation

BUSINESS is sound and 1928 will develop along the lines of 1927, when intensive selling and pressure to lower production costs were the most important factors, according to the consensus of one hundred editors of trade, industrial and professional journals in answer to a questionnaire sent to them by the National Conference of Business Paper Editors and the Associated Business Papers. There are no indications of a slump, but rather definite indications of increase in several lines. No excess inventories are reported either in wholesale or retail, except in a few specialties where the market has been over-estimated. Farm buying power will be larger in 1928.

Indexes of trade which measure week-to-week activities, such as electric power used, output of pig iron and steel ingots, building construction and freight loadings, are slightly greater than or slightly less than those of 1926. Power used in 1927 increased 7 per cent over the previous year. Pig iron totaled 36,300,000 tons, putting 1927 in eighth place among big years. Steel ingot output was about 8 per cent less for 1927 than for 1926, making 1927 fifth among years of largest output. Total construction was down, but up 2½ per cent in industrial building and 11 per cent in heavy construction.

In a review of the year the editors found increased pressure to reduce production and selling costs, higher specialization in machinery, widespread replacement of obsolete and inefficient machinery, aggressive market finding, and reduction in size and intensive development of jobbing areas. There is likewise a genuine desire to keep wages at their present level in all the basic industries, and manufacturers and merchants are seeking to continue with narrow profit margins without reducing wages or raising prices. Some trades show softening in prices, but most trends indicate prices of 1928 will be about the same as 1927. Volume of railroad freight declined, especially in the latter part of 1927, but, in common with other trades, there is expectation of an increase in freight during 1928. Gross revenue of bus lines was 25 per cent higher in 1927 than in 1926, and total pay rolls were up 30 per cent. Volume of waterborne freight was slightly greater in 1927 than in 1926, and tonnage rates held steady. In the automotive industry expenditures for new plants were larger in 1927 than in 1926, due especially to one or two very large construction enterprises and the remodelling of the Ford plant. New construction in the textile field increased, with an accompanying fact that many obsolete plants were modernized or dismantled. Rehabilitation of private power plants continued through 1927, and promises to be still more active in 1928. In general, the close of 1927 finds the industries of the United States with stocks which deviate little from the volume at the close of 1926, reflecting continued hand-to-mouth buying.

# Exterior Holiday Lighting Spreads Cheer

CHRISTMAS decorations, in the form of outdoor electric lighting, have become an old story to many people in the electrical field, and the decorations probably do no more than contribute to the general community spirit of Christmas.

But Christmas decorations, like everything else, take on distinctive qualities and attract particular attention when done in an unusual way. Even the Pennsylvania Railroad puts a Christmas tree in each one of its stations, probably to show that, after all, it is run by human beings. Some utility executives believe that all central

ONE OF THE HOMES IN CLEVELAND WHICH TOOK PART IN ELECTRIC OUTDOOR DECORATION DURING THE HOLIDAY SEASON

stations should make a very marked display of Christmas decorations for very much the same reason—that the men behind the central stations are men who are active in the community and have a deep interest in the community spirit. Since decorating its buildings in this way one utility has received a number of very favorable comments and one or two letters from business men in several of the cities where its offices are located. These comments emphasize the manner in which the scheme of decorations was carried out.

A department store in Cleveland won the first prize awarded commercial buildings for holiday decoration. The exterior was draped with lighted evergreen festoons and pendants from the cornice and illuminated Christmas trees with their bases on the second floor level.

# Radio Interference Interception

By B. E. Ellsworth

Electrical Engineer Iowa-Nebraska Light & Power Company
Lincoln, Neb.

RADIO interference can reach a radio set from the source of trouble by direct radiation (the X-ray is a good example) and over the electric service wires. To minimize that interference spread by service wires, why not put a wave trap or filter at the entrance switch? The writer has had such a wave trap in his home for more than a year and it has worked so successfully that he feels that it would be of great benefit to others. A vibrator charger can be running at "top speed" in a house next door and radio reception is not affected. No exact figures can be given on the amount of the interference that will be intercepted as it depends upon the location of the house with respect to power lines and the type of interference.

There are various makes of traps on the market selling for $10 to $20 which undoubtedly will do the work as well or better than the one utilized, if they can be secured with sufficient current-carrying capacity for the load which they will have to carry. Doubtless there are traps on the market which have been approved by the National Board of Fire Underwriters. The purpose of this article is not to recommend any type or make of trap, but to emphasis that a trap can be procured and installed to the great benefit of set owners.

The trap used can be plugged into two convenience outlets near the meter, and uses no power. The material cost is approximately $3, it can be made by the average person in a few hours. The principle of this trap was not originated by the writer, but the plug-in feature seems to be original and is convenient in that the trap may be used only when necessary and can be considered as an appliance instead of a permanent wiring fixture.

The first step is to ascertain that there is a ground on one side of the service on the line side of the entrance switch. A piece of No. 8 wire or larger may be used for this purpose. Often a ground installed in this way will eliminate considerable radio trouble from distribution lines. The sketch shows the connections and construction of the home-made trap. It is assumed that this trap is to be used in an average private home. A large trap permanently wired in and enclosed in a steel box can be used in apartment houses, etc. A receptacle should be installed in series with the non-grounded lead from the meter for plugging in the trap. It will be necessary to substitute a short-circuiting switch or shorted plug to short this receptacle when the trap is not in use. The second receptacle is simply a tap to the grounded service wire, to ground the metal pipe in the core of the coil. The leads from the coil should be separated as much as possible and double-conductor cord should not be used for this load. The coil proper is wound on a combination wood-and-iron form. The iron part of the core is composed of a two-inch pipe a foot long with a slit cut lengthwise on one side to eliminate eddy currents. This form is covered with three layers of empire cloth or 1½-in. friction tape and wound full of No. 14 (No. 12 for 10-amp. load) magnet wire which should be shellacked or painted. This coil may be mounted in a wooden box.

CONSTRUCTION AND INSTALLATION OF TRAP FOR SYSTEM-PROPAGATED RADIO INTERFERENCE

# Letters from Our Readers

## Design Drawings Part of Contract Proffer

*To the Editor of the* ELECTRICAL WORLD:

The reply to your question on prospective purchasers appropriating designs and design drawings without payment, in the issue of Dec. 31, may be found in the Ten Commandments. A quotation and the blueprints accompanying it are a proffer of contract which the purchaser may accept or reject, but may not change. In other words, the quotation proposes to exchange a design and material for a definite amount of money—it does not offer a free gift of either.

Just what the "good of the industry" or the overhead cost of design has to do with the honesty of a particular transaction is not altogether clear. In a so-called buyers' market, where everything seems to go —on one side—it might be well to give the other side a hearing, even though the testimony needed expurgating. For example, sending out inquiries by multigraph, hunting for a sucker, accepting a palpably erroneous bid because the seller was "responsible," whipsawing bidders to unreasonable figures, radical changes after details are completed, etc.

It is not claimed that all buyers do all or indeed any of the above, but such things are as well known among the sellers as is the identity of those who do them.

R. D. COOMBS.

New York.

# Digest of Electrical Literature

## *Transmission, Substations and Distribution*

*Transmission Tower Diagonal Bracing.*—C. R. Young, W. B. Dunbar and E. B. Allan.—The authors report the results of a series of tests made at the University of Toronto in an endeavor to determine the deflections in various struts used in the fabrication of transmission towers. It was particularly desired to throw some experimental light on the effective length of bracing struts. A series of specimens were made up and tested to failure. Extensometers were atttached to the struts and furnished some of the desired information. The results, as plotted in deflection diagrams, offer a basis for comparing the value of several types of frames of different cross sections. The authors conclude that the effective or equivalent unsupported length of a strut, stayed laterally by an intersecting tension member, varies from about 73 to 117 per cent of the distance center to center of end connections. The advisability of not reducing the center-to-center length by more than 25 per cent, and preferably by not more than 20 per cent, is indicated as a result of the several tests made in the course of this investigation.—*The Canadian Engineer*, Oct. 11, 1927.

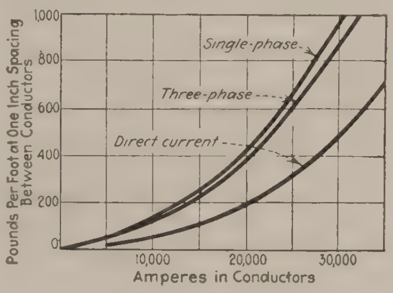
*Overhead Electric Line Design.*—William T. Taylor.—The various factors entering into the standard for safety and construction in the design of overhead open-wire construction are reviewed in this article. A comparison of English and American practices is given, with particular consideration for the standards of loading and the development of factors of safety for overhead work. The desirable economic characteristics of wood poles and structural steel towers has been developed. The figures given refer almost exclusively to American practice.—*Electrical Review, (England)*, Nov. 11, 1927.

## *Generation, Control, Switching and Protection*

*Super-excitation.*—D. M. Jones.—The speed with which the excitation of a synchronous machine can be made to counteract abnormal drops in line potential largely determines the effectiveness of the machine in increasing the stability of the system. The effectiveness of super-excitation in producing rapid changes in excitation so greatly exceeds the ordinary quick-response excitations as to be of a totally different order. In this article the author has described the newer method and has offered an approximate comparison with normal excitation, quick-response excitation and super-excitation for a 30,000-kva. 600-r.p.m., 13,800-volt, synchronous condenser. The features of this marked advance in excitation practice are stated to be the increase in the rate of rise of the exciter voltage from a basis of 400 to 600 volts per second to 6,000 to 7,000 volts per second; the rise in the maximum possible instantaneous voltage which can be applied to the alternating current machine field under conditions of system disturbance from approximately 320 volts to approximately 1,000 volts; and the use of the change in the output of the alternating current machine during the disturbance as a measure of the effectiveness of the excitation system.—*General Electric Review*, December, 1927.

## *Units, Measurements and Instruments*

*Short Circuit Effects Upon Current Transformers.*—G. L. E. Metz.—The author suggests that the time has come when current transformers, like oil circuit breakers, should be designed for definite short-circuit rating, and he offers some suggestions as to how this should be done. The destruction of a current transformer is said to be brought about by either the mechanical forces exerted upon the windings exceeding their disruptive limit, or by the temperature rising sufficiently to injure permanently the insulation. The design of supporting insulators and clamps must be such as to withstand the mechanical forces. The magnitude assumed between conductors spaced one inch apart is indicated in the accompanying curve. Analysis has been made of the various designs and types of current transformers available today and the author states that in the majority of modern designs, it is found that, under the most severe conditions, that is, when the magnetic core is saturated, the open-circuit secondary-induced electric-motive force rarely exceeds 400 volts. The total resistance of the circuit will be about 2 ohms, so that under no conditions is the secondary current likely to exceed about 200 amp. The accompany figure illustrates the force value between conductors.—*—Electrical Review (England)*, Nov. 25, 1927.



MECHANICAL FORCES BETWEEN CONDUCTORS

## *Hydro-Electric Development and Steam Equipment*

*Steam Generation.*—W. J. Kearton.—The theoretical considerations, the possible thermal efficiency and the future problems related to the practical application of the binary fluid principle, as applied to steam generation, are developed. The author foresees future problems as centering around the boiler. Thermodynamic considerations, involving both assumed and derived data, are offered for the mercury-vapor steam unit. The advantages enumerated by the author include: low pressure for high temperatures, with accompanying lower working stresses in parts subjected to the pressure; the favorable physical properties of mercury for the attainment of high thermal efficiency; the few stages required when using this material, due to its high molecular weight; and the freedom from decomposition when heating. The disadvantages are stated to be high cost, small heat content and poisonous character of the metal vapor.—*World Power (England)*, December, 1927.

*Continuous Combustion at High Pressure.*—E. C. Wadlow.—The problems of design and operation encountered in the development of an experimental high-pressure, single-jet gas burner, and of a similar high-pressure multi-jet gas burner are described in this article. As the furnace used was an auxiliary to other apparatus and proved equal to the work demanded of it, careful tests were carried out to determine its efficiency by measuring the heat distribution through exit passes and through furnace walls after combustion. Figures and details regarding the behavior of the plant when using high-pressure combustion are given. A pressure of 100 lb. per sq.in. was realized in the combustion chamber. The maximum temperature recorded at this pressure was 1,435 deg. C. This was maintained without difficulty.—*The Engineer (England)*, Dec. 23, 1927.

## *Illumination*

*Technique of Economic Studies of Lighting in Industry.*—J. W. Barker.—The psychological and illumination questions arising in economic studies of illumination in factories have been analyzed and as a result a procedure for such investigations is suggested. This includes those factors influencing production. Emphasis is placed upon the importance of the psychological control, which is necessary if results are to be accurate. Among the factors which have been identified as affecting speed and quality of industrial production and the general welfare of industrial operatives, are the following: direct effect of illumination, to increase facility of vision; secondary effects of illumination, to increase agreeable working conditions; the effect of changed supervision, incident to the taking of data required for deriving test conclusions; the effect of conscious control of production rate; the effect of temperature, humidity, carbon dioxide, etc. in the work rooms.—*Transactions of the Illuminating Engineering Society*, 1927.

*Specifications for Residential Lighting Equipment.*—These specifications have been designed to promote improvement in artificial lighting in residences through the employment of lighting equipment which will render convenient and effective illumination, with conservation of eyesight and enhanced decorative qualities. A simple but highly effective device has been prepared for the estimation of comparative glare values of light sources through the use of standards employing the usual commercial lamps.—*Report, Illuminating Engineering Society*, 1927.

*Light for Ornament.*—A. L. POWELL.—An exposition of the potentialities of light as a decorative medium. A number of uses are illustrated to indicate the interesting and attractive ways in which unusual light applications may be applied in order to secure artistic effects in the home, and in other locations where aesthetic illuminating effects are desired.—*Transactions of the Illuminating Engineering Society*, 1927.

## *Electrophysics, Electrochemistry and Batteries*

*Some Criticisms on Electric Resistance and Its Derivative.*—H. NAKAMOURA.—The confusion between electric resistance and differential-electric resistance is pointed out. As a result of investigation and mathematical determination, the author concludes that ordinary resistance is a mere quotient of the instantaneous value of the component, which is in phase with the current of the potential difference of any two points, to the instantaneous value of the current passing through there, and has no vectorial sense. The differential resistance is, however, the first partial derivative of the former with respect to the latter and has both sense and magnitude. The Wheatstone bridge and its variations, unless balanced with a galvanometer or telephone circuit by constant equipotential, measures the differential resistance and not the ordinary one. The alternating current bridge generally measures the differential effective resistance. When the current is small or its effective resistance is non-directional, differential effective resistance numerically approaches ordinary effective resistance.—*Journal of the Franklin Institute*, December, 1927.

*The Time Lag of Spark Gaps.*—Y. TORIYAMA.—An investigation involving a new method of measurement of the spark-lag phenomena was undertaken by the author with the use of a Braun tube. The methods of test consisted in connecting the deflecting plates of the tube to a spark gap in series with them and applying an impulse voltage to the gap and to the cathode of the Braun tubes simultaneously. An absence of time lag in the gap causes the impulse voltage to be applied to the cathode and to the deflecting plates of the tube at the same time so that the electrons emitted at the cathode are deflected by the electrostatic field of the plate and no spark is indicated on the fluorescent plate. When a spark lag exists in the gap, the cathode is excited as before, but the time lag preceding the charging of the deflecting plate is indicated by a spot on the fluorescent plate of the tube. The author concludes that the time varies with the dimensions of the gap electrode, and that ultra-violet rays from a quartz lamp cause a definite reduction in the period of time-lag phenomena.—*Journal of the Institute of Electrical Engineers, (Japan)*, November, 1927.

*The Relation Between the Secondary Electron Emmission from Nickel and Tungsten, and the Temperature.*—HEIICHI NUKIYAMA and HATSUO HORIKAWA.—The present investigation was undertaken in an endeavor to obtain further information regarding the secondary electron emission from several metals at moderately high temperatures. Three-electrode vacuum tubes were used in this series of experiments, and the construction of the valve, the evacuation, and the wiring diagram used are described in connection with the data obtained regarding anode current and voltage characteristics, the change in the apparent secondary electron emission with anode temperature, the relation between the critical, potential and the temperature, and similar pertinent phenomena.—*Technology Report of the Tohoku Imperial University, (Japan)*, 1927.

## *Miscellaneous*

*Super-Tension Cable Drums.*—The use of high-tension cables involves increased weight and length of conductor assemblies and has necessitated new practices for the successful and economical transportion of such materials to the point of utilization. A low body trailer especially designed for cable drum handling has been devised to meet the conditions involved in British practice. This equipment is said to possess the virtues of ease of operation, low labor costs, safety of operation, economy in time, and ease with which the cable may be laid directly from the trailer. Comparative figures are offered of relative transportation costs and results obtained through the use of various devices and types of transporting equipment.—*The Electrician (England)*, Oct. 7, 1927.

*The Integraph Solution of Differential Equations.*—V. BUSH AND H. L. HAZEN.—The authors describe a machine which constitutes a revision of a previously constructed device for the solution of differential equations involving a single integration. The revised machine is of such design that an equation involving two successive integrations, corresponding to practically any second-order differential equation, with all terminal conditions, can be solved. The need for a workable means for solving the differential equations, involving empirical and discontinuous coefficients which occur repeatedly in electrical engineering and physics, is recalled. In the machine described, such solutions are effected by means of suitable, interlinked, integrating devices, the result being plotted continuously as a function of the independent variable. Tests and simple solutions show the over-all error to be approximately 1 or 2 per cent. The various sources of this error are discussed.—*Journal of the Franklin Institute*, November, 1927.

*A New Propeller-Type, High-Speed Windmill for Electric Generation.*—E. N. FALES.—It is stated by the author that a recently developed airplane-type windmill, possessing the characteristics of improved lightness, efficiency and cheapness, as well as higher rotative speed, may be manufactured to compete with gasoline farm-lighting plants. The factors considered in this discussion are the development of a rational windmill theory, the difference between pumping and electric generating mills, the aerodynamic methods of analysis, the variables used in windmill design, the form of blade, methods of regulation, wind velocity, and energy content, for a typical year, choice of wind velocity range as based upon the calmest month, choice of windmill diameter and the available energy of the wind.—*Mechanical Engineering*, December, 1927.

*Inductive Signal Transmission to Trains.*—P. TATZ and A. KAMMERER.—A large amount of experimental research work is reported to have been done since 1919 to devise a fully reliable signal transmission system from the road to a moving train. Of the various methods tested, only the inductive method proved sufficiently promising to develop beyond the experimental stage. One section of the German Federal Railways has adopted this system as part of its standard equipment. Magnetic coupling between an alternating current excited solenoid on the locomotive and a stationary receiving solenoid, mounted on the road bed, the two forming a resonant circuit, is the basis of the system. A relay on the train is energized at all times except when passing over the signal point. To insure reliable operation, the ratio between holding and tripping force of the relay is made about three to one. A number of circuits are illustrated in this article and mathematically investigated as to their suitability for service. A second article discusses the shape of the resonance curves obtained. This system is energized by the customary small steam turbine on the locomotive which drives, in addition to the direct current lighting generator, a special alternating current generator.—*Elektrotechnische Zeitschrift*, Oct. 27, 1927.

# News of the Industry

## Walsh Resolution Meets Criticism

### Public Service Commissioners Defend Their Course and Uphold State Regulation—Testimony from Insurance and Banking Heads—Senator Lenroot's Argument

By Paul Wooton

*Washington Correspondent of* Electrical World

Vigorous opposition to the Walsh resolution — opposition of a character calculated to impress Congress more than any that could be exerted by the utilities themselves—has come from the utilities commissioners of the states, from investment bankers and from representatives of securities owners.

When Senator Watson of Indiana called the interstate commerce committee of the Senate to order on Jan. 16 he said that the committee must consider the advisability, necessity and expense of an investigation into the conduct of public utilities of the far-reaching character indicated in the resolution which he read. Thereupon Senator Walsh made a long statement in justification of a minute inquiry by a special committee of the Senate into virtually every phase of the public utility business. He asserted in the course of his argument that "there is a view entertained by not a few people that the state commissions are not really functioning as they should because these utility corporations are constantly contributing large sums to control elections, and in one way or another they thus control state conventions."

### Senator Bruce in Defense

This statement brought a vigorous rejoinder from Senator Bruce of Maryland, who said: "That is not true as far as Maryland is concerned, because our commission gives entire satisfaction to the people as well as to the utility corporations themselves." Senator Walsh is considered to have weakened his case when he said in reply: "Bear in mind that I do not undertake to assert that there is any truth whatever in the charge, but if we are going into this matter I think that should become the subject of inquiry."

Senator Wheeler of Montana, a member of the committee, asserted that he had been informed reliably that power companies desirous of competing with those affiliated with the large holding companies find the banks unwilling to finance them. Senator Walsh said that this might come within the purview of the investigation, but he evidently was not ready to emphasize that point as a member of the committee had raised the question whether the investigation was likely to lead into a probe of banking. Senator Walsh expressed the opinion that he did not think this would be the result. He also said that it was his intention in framing the resolution to exclude an inquiry into the conduct of telephone, telegraph and radio companies. He gave it as his view that those activities should be investigated but not as a part of the utilities inquiry, as such a scope would make it too broad.

### Commissioners Take Stand

A committee representing the National Association of Railroad and Utilities Commissioners made a special point of Senator Walsh's statement in a report which was submitted to the committee at its subsequent session. That report follows:

> The special committee representing the National Association of Railroad and Utilities Commissioners declare themselves in favor of placing at the disposal of any duly authorized agency of the Senate or of Congress any relevant information concerning public utility regulation within the possession of the several state commissions. They thoroughly believe that all facts in connection with utility operation and regulation should at all times be open to the public and its representatives. On behalf of such commissions they challenge the statement made by Senator Walsh at the hearing yesterday in which he made suggestions regarding the proper functioning of state commissions, at the same time disclaiming knowledge of any facts justifying such belief. They believe that any investigation fairly conducted cannot fail to justify the work that has been done by the state commissions and vindicate the principle of state regulation.
>
> The commissions declare themselves opposed to invasion by the federal government in any manner of the rights of the sovereign states in the control and the regulation of public utilities. Therefore these commissions are opposed to any action of Congress that might result in an invasion of state rights or the substitution of national for state utility control.

The foregoing statement was signed by Lewis E. Gettle, chairman of the Railroad Commission of Wisconsin, chairman also of the special committee; William A. Prendergast, chairman Public Service Commission of New York; W. D. B. Ainey, chairman Public Service Commission of Pennsylvania; Charles E. Gurney, chairman Public Utilities Commission of Maine; Amos A. Betts, Arizona Corporation Commission, and H. H. Corey, Public Service Commission of Oregon.

Mr. Gettle explained that the commissions are not opposed to a federal investigation of matters included in the resolution which involve interstate commerce and interstate transactions. On that point, however, Mr. Ainey called attention to the fact that the states are co-operating very successfully in the handling of the interstate problems.

Senator Walsh places principal reliance, in justifying the authority of Congress to undertake such a probe, on the theory that the securities of utility companies and of the holding companies pass in interstate commerce. He stated that "securities of the public utility companies are advertised in great financial journals and are sold upon the Stock Exchange and pass through the mails and by express and otherwise from one state to another." He cited a number of court decisions to support his theory that the passage of securities from one state to another constitutes interstate commerce.

Mr. Gettle stated that only 9 per cent of the total production of electricity is transmitted in interstate commerce. He, too, pointed out the success in arranging between states for the regulation of rates for electricity produced in one state and consumed in another. At another point in his testimony Mr. Gettle called attention to the fact that "public utility stocks and bonds have a far more extensive and comprehensive supervision than any other class of securities issued in the United States, and that if the purpose is to have federal regulation for the protection of investors, then it would spread out into an examination of all securities."

When Senator Walsh said: "Apparently what you are afraid of is that there will be some legislation that will interfere with the rights of the states in this matter," Mr. Gettle replied vociferously, "Yes, and every type of federal regulation that we have had any experience with has resulted in increased rates and diminution of power."

### Financial Chiefs Testify

Frederick H. Ecker, vice-president of the Metropolitan Life Insurance Company, pointed out that the life insurance companies number among their assets a billion dollars' worth of public utility securities. He pointed out further that the life insurance companies have in force $87,000,000,000 of insurance, which covers 62,000,000 individual lives. Because of those vast interests he urged that any investigation be one of fact finding and along the lines of a judicial inquiry. An investigation of a sensational character, he said, would have the result of depressing the values of securities and retarding the companies from securing the capital necessary for the further development of their properties.

Henry R. Hayes, president of the Investment Bankers' Association of

America, spoke along similar lines. Among other things he made the following reference to the utility industry:

> The public utility industry is now in a very desirable condition of prosperity. The reason for this is because, as a whole, it is economically sound throughout. It supplies "products" the usefulness of which is constantly growing and virtually universal and unlimited. Through its technical, managerial and financial progress it has consistently effected improvements and expansion to meet, economically and efficiently, the ever-increasing demands of the public. It is ever a pioneer, going continually into new fields, even today bringing electric service to the farmer in a degree not practical a few years ago. It is a vital part of the industrial, the civic and the home life of the nation, an integral factor in the country's prosperity, its creation and distribution of new wealth.

### SENATOR LENROOT'S ARGUMENT

The committee on Wednesday heard the argument of former Senator Irvine L. Lenroot, counsel for the Joint Committee of National Utility Associations. In submitting a comprehensive brief which has been prepared by leading utility lawyers throughout the country in opposition to the resolution, Senator Lenroot said that if the resolution prevailed in the Senate in its existing form, it would compel the proposed special committee to investigate not only the utility companies and the holding companies but every bank, insurance company and other corporation holding utility securities and that it would be the greatest and longest task ever undertaken, with the possible exception of the valuation of the railroads. Senator Lenroot called attention to a chart contained in the brief which showed that while all other commodities had increased in price, some as much as 120 per cent, since 1913, the average price of electrical energy had shown a decrease of 12 per cent.

Senator Walsh on Monday read into the record an interview in the Brooklyn *Eagle* with Owen D. Young, chairman of the board of the General Electric Company, in which he stated that the utilities would not oppose an investigation. Mr. Lenroot read a part of that interview in which Mr. Young declared that the utilities would not oppose an investigation by proper authorities when specific charges had been made. Mr. Lenroot insisted that no specific charges had been made against the utility companies and issued a direct challenge to Senator Walsh to show the contrary. He referred to the statement made the previous day by Chairman Gettle of the Wisconsin Utilities Commission in which he said he could not reply to rumor. "No facts have been placed in the record," Senator Lenroot said, "to show that such an investigation is needed or warranted. No prima facie case had been made out. Senator Walsh takes the position that the Senate should investigate in order to determine whether there is anything wrong." He added that the language of the resolution makes it mandatory upon the proposed special committee to investigate each and every company.

The Senate has no jurisdiction to investigate or legislate on most of the proposals contained in the resolution, Mr. Lenroot contended. Matters pertaining to interstate commerce and the violation of the existing federal statutes, however, would be proper subjects for investigation. Inviting the committee's attention to the clear line of demarcation between federal and state jurisdiction, he said that this was one of the most serious matters the interstate commerce committee ever had been called upon to consider. He asked if there was to be initiated a policy of centering in some bureau in Washington the duties belonging to the states. Another point the Senator made was that of all the corporation securities issued in the United States only 3 per cent were public utility securities and that fully 20 per cent of all securities, including the utility issues, are owned by holding companies.

Former Senator Thomas of Colorado appeared specifically on behalf of the Cities Service Company and argued along similar lines.

Owing to an important Democratic caucus, there was no session of the committee on Thursday.

## Commissioners of Four States Form Association

Members of the Public Service Commissions of Pennsylvania, New York, New Jersey and Maryland in a two-day meeting at Philadelphia have just organized the Middle Atlantic States Utility Commissioners' Association. William D. B. Ainey, chairman of the Pennsylvania commission, was elected president and Commissioner J. F. Harper of Maryland was elected secretary.

A paper on valuation was read by William A. Prendergast, chairman of the New York commission, and the subject was discussed in reference to the organic law and the interpretations placed on it by state and federal courts. Chairman Ainey reviewed the development of the electrical industry and conducted a discussion of problems, including those concerned with holding companies, with consideration of the relation of the commissions to the Walsh resolution and the proceedings of the Senate committee to which it was referred.

## New York Assemblyman Assails State Commission

Declaring that the New York Public Service Commission and its employees are acting in concert with private utility corporations to compel citizens to pay exorbitant costs for the use of electrical power, Assemblyman Cuvillier, a prominent New York City Democrat with independent proclivities, has introduced in the Legislature a resolution providing that the Assembly judiciary committee investigate all complaints and report back to the Legislature by March 2.

## Four Large Firms Combine as Engineers and Constructors

Formation of United Engineers and Constructors, Inc., with its main office in Philadelphia and branch offices in New York, Newark, Chicago, Los Angeles, Atlanta, Pittsburgh, Houston, Montreal, Rio de Janeiro and Buenos Aires, was announced on Tuesday, Jan. 17. The company thus formed will combine the U. G. I. Contracting Company of Philadelphia, the Public Service Production Company of Newark, Dwight P. Robinson & Company, Inc., of New York and the Day & Zimmermann Engineering & Construction Company of Philadelphia. "With a background of more than 45 years of successful work," says the announcement, "the company will operate in any part of the world under broad powers permitting participation in every form of engineering and construction activity." Dwight P. Robinson, widely known as an electrical engineer, executive and plant builder, will be president of the new company. Arthur W. Thompson, Thomas N. McCarter, Samuel T. Bodine, Paul Thompson, John E. Zimmermann and Mr. Robinson will be directors. The new company is launched with contracts in hand amounting to more than $100,000,000.

## N.E.L.A. Commercial Section Men Gather at Chicago

Eleven committees of the National Electric Light Association, Commercial National Section, are holding a series of meetings this week at the Edgewater Beach Hotel, Chicago. More than two hundred members had registered at the time the ELECTRICAL WORLD went to press, with Chairman J. E. Davidson presiding. The plans of the year are under discussion, with the most progressive program that has been undertaken in recent years before the gathering. The power, merchandising and wiring committees are particularly active. Detailed reports of these meetings will be published next week.

## Television Demonstrated by General Electric Company

A demonstration of television was made on Friday afternoon, Jan. 13, in Schenectady under the direction of Dr. E. F. W. Alexanderson, consulting engineer of the Radio Corporation of America and the General Electric Company, who with his assistants has been working on the problems involved in this new art for seven or eight years. Receiving sets, the development of recent months, were established in three Schenectady homes, and the motion pictures were sent through the air, accompanied by vocal transmission. One "announcer" was shown smoking a cigarette and commenting on its flavor, and a ukulele player hummed a song to the accompaniment of his instrument.

The receiving sets in private homes

were at the residences of E. W. Allen, vice-president of the General Electric Company in charge of engineering; Edwin W. Rice, Jr., honorary president of the board of the company, and Dr. Alexanderson. The experiment was entirely successful, and David Sarnoff, general manager of the Radio Corporation of America, described it as an "epoch-making development." Television sets were not ready for the market, he said, but he predicted that in five years television would be "an art and an industry in this country."

## California Light and Power Companies Cut Rates

Rate reductions applicable to domestic lighting, cooking and heating and commercial lighting were announced on Jan. 17 before the California Railroad Commission by attorneys for the Pacific Gas & Electric Company, Great Western Power Company, San Joaquin Light & Power Corporation and the Midland Counties Public Service Corporation. Details of the new rates and the amount of the reductions are to be announced later. It is understood that the new tariffs will be applicable about March 1.

## Policy for Muscle Shoals

*House Committee Adopts Five Principles to Govern Sale or Lease, Which Must Be in Entirety and Insure Fertilizer Production*

SALE or lease of the Muscle Shoals project in its entirety and a requirement that fertilizer must be manufactured at prices attractive to the farmer are among the principles which will govern any disposition of the properties by the government, it was decided on Jan. 13 by the House committee on military affairs. The full text of a resolution adopted by the committee, embodying these principles, follows.

1. That the property shall at all times be subject to the absolute right and control of the government for the production of nitrates and other ammunition components of munitions of war, and that Nitrate Plant No. 2 or its equivalent, or such other nitrogen-fixation plant or plants adjacent or near thereto as may be constructed, must be kept available therefor by the purchasers, lessees or users of the property.

2. That the purchasers, lessees or users of the property shall be obligated in the strictest terms to the manufacture and offer for sale to the American public of fertilizers in times of peace, of a volume of not less than 40,000 tons annually within fifteen years of the commencement of the term of the lease, and at prices and of kinds calculated to be attractive to the farmer.

3. That any proposal for the purchase, lease or use of the Muscle Shoals property of the United States government must be for the entire property.

4. In the consideration of any offers for Muscle Shoals, that it be a prerequisite that such offer contain a stipulation that the lessee, operating agency or owner, as the case may be, be required to return to, or account for, to the government, either in cash or by way of reduction in the price of the fertilizer manufactured, the profits from the sale of power which would have been used in the manufacture of fertilizer in case there had been no discontinuance in the manufacture thereof; that the manufacture of fertilizer may be discontinued only when there shall be such excess accumulation of fertilizer stocks as shall be in excess of the reasonable or prospective demands for such fertilizer, and such manufacture shall be resumed upon reduction to a reasonable degree of such accumulated stocks.

5. That any bid must contain such forfeiture or penalty provision as will protect and safeguard the interests and the rights of the government on account of any failure of the lessee, operating agency or owner, as the case may be, to fully keep and perform its obligations and undertakings under the contract.

## Truce Over Maryland Dispute Is Entered Into

The litigation between the Consolidated Gas, Electric Light & Power Company of Baltimore and the Northern Maryland Power Company for the right to serve Havre de Grace, Md., which was to have come before the Circuit Court at Elkton on Jan. 17, was postponed for 30 days, and negotiations between the two utility concerns to effect a compromise were begun. The fight between the two companies was taken to court on appeal by the Northern Maryland company from the Public Service Commission's decision last August granting the Baltimore company the right to serve Havre de Grace, despite the claim of its rival, now controlled by the Philadelphia Electric Company, that its field was being invaded. While the heads of the two utilities would not say so, local observers believe it possible that a compromise will now be effected through an exchange of territorial rights.

## Prominent Engineers Sponsor Tokyo Congress

Appointed by Secretary Herbert Hoover, as honorary chairman, 78 prominent American engineers, scientists and industrial leaders have accepted membership on the American committee of the World Congress of Engineers, to be held in Tokyo in November, 1929, according to a statement just issued by Elmer A. Sperry, chairman of the National Research Council. The permanent American committee will promote the aims and purposes of the movement and arrange for attendance of American engineers at the congress. Many of its members are closely associated with the electrical industry, including Thomas A. Edison, Samuel Insull, Gerard Swope, James H. McGraw, Michael I. Pupin, Edward Dean Adams, A. W. Berresford, John J. Carty, Gano Dunn, Bancroft Gherardi, E. M. Herr, Frank B. Jewett, John W. Lieb, C. O. Mailloux, E. W. Rice, Jr., H. T. Sands, Elmer A. Sperry, L. B. Stillwell, Calvert Townley, W. E. Wickenden, F. L. Hutchinson, D. C. Jackson, A. E. Kennelly, C. C. Chesney, Robert A. Millikan, Charles F. Scott and Elihu Thomson.

## Power Board Issues Wolf River Permit

*Savannah and Connecticut River Projects Get Licenses—Flathead River Promoter Ready for One—Conflict Over Feather River Development.*

A PRELIMINARY permit for the Wisconsin Power & Light Company, covering five sites within the Menominee Indian Reservation in Wisconsin, was authorized by the Federal Power Commission at a meeting held on Jan. 18. A license for a power site partly within the reservation was issued this company July 20, 1927. The remaining five sites, with a proposed installed capacity of 20,000 hp., have been reported on favorably by the Chief of Engineers and the Commissioner of Indian Affairs, with the understanding that the rights of navigation and the claims of the Indians for compensation are to be respected. The commission is of the opinion that the scenic features of the region, about which there has been agitation, can be safeguarded, and the permit will carry a special provision to this end.

A license was authorized for the Savannah River Electric Company of Greenwood, S. C., covering a 120,000-hp. project 220 miles above the river's mouth.

A license for the Northern Connecticut Power Company's project on the Connecticut River near Windsor Locks was granted. The installed capacity is to be 49,800 hp., and the plant will make full use of the power possibilities on the section of the river involved.

Walter H. Wheeler of Minneapolis has applied for a license covering a project on Flathead River and Flathead Lake in Montana. He proposes to develop power at five sites on Flathead River, using Flathead Lake as a reservoir. The aggregate installation at these sites would be 170,000 hp. This application conflicts with one of the Rocky Mountain Power Company.

The Pacific Gas & Electric Company has applied to the Federal Power Commission for a preliminary permit covering a project on the Middle and South Forks of Feather River near Quincy and Oroville, Calif. The application is in conflict with an outstanding preliminary permit held by the Oroville-Wyandotte Irrigation District on the South Fork. There is no conflict on the Middle Fork as the application made by Lars Jorgensen for a license on that stream has been rejected owing to the fact that he could not demonstrate where most of the power would be marketed. The Pacific Gas & Electric Company plans to construct four storage reservoirs with 252,000 acre-feet of storage on the Middle Fork. One storage reservoir of 108,000 acre-feet capacity is proposed for the South Fork. The project includes the erection of five dams. One is to be 370 ft., another 175 ft., another 108 ft., the fourth 50 ft. and the fifth 20 ft. high. There are to be eight power houses, in which it is proposed to install a total of 360,000 hp.

## Purchases and Mergers

*American Power & Light Seeks Control of Washington Water Power Company — An Oregon Merger Scheduled—Arizona Edison Changes Hands*

EARLY acquisition by the American Power & Light Company, New York, of control of the Washington Water Power Company, Spokane, is indicated by the announcement that the company first named has offered to exchange two and two-tenths shares of its six-dollar cumulative preferred stock for each share of Washington Water Power common. The Washington Water Power Company owns and operates eight hydro-electric power plants in Washington and Idaho along the Spokane River and at Lake Chelan.

Plans for merging smaller affiliated companies with the Pacific Power & Light Company, Portland, and for refinancing the new and larger Pacific Power & Light Company, recently announced by President Guy W. Talbot, have had to be postponed because of legal details which require more time, but it is expected that the merger will be consummated about Aug. 1. The plan calls for the incorporation of a new Pacific Power & Light Company to include not only the old company but seven smaller companies acquired in recent years by its holding company, the American Power & Light Company. These companies are the Sherman Electric Company, Moro, Ore.; Enterprise Electric Company, Enterprise, Ore.; Deschutes Power & Light Company and Deschutes Ice Company, Bend, Ore.; Grangeville Electric Company, Grangeville, Idaho; Yakima Steam Heating Company, Yakima, Wash., and the Inland Power & Light Company, Portland. Excepted from the merger are two distributing systems of the Inland company in Cowlitz and Clark Counties, Wash., and Columbia County, Ore., now being operated by the Northwestern Electric Company, Portland, in which no change of status is contemplated.

The People's Light & Power Corporation of New York has bought the capital stock of the General Power & Light Company of Chicago and its subsidiaries, which are in Western states and include the Arizona Edison Company. G. L. Ohrstrom & Company will, it is reported, finance the purchase.

The Insull power-company interests are negotiating for the Utilities Power Company of Meredith, N. H.; the Franklin Electric Company and the Northfield Electric Company of New Hampshire, but no confirmation that sale has been completed had been received from Augusta up to Thursday morning.

The Southern California Edison Company has asked the Railroad Commission for authority to purchase the Ojai Power Company, which operates in Ventura County.

The Nebraska Gas & Electric Company has taken over the Holmesville (Neb.) hydro-electric plant of J. J. Steinmeyer and F. B. Ryons for $145,000.

Douglas and Breckinridge, Okla., have sold their municipally owned light plants and distribution systems to the Oklahoma Gas & Electric Company. The vote in each municipality was unanimous. Drummond may follow suit.

Sidney, Iowa, served by the Iowa Service Company, has voted by 194 to 47 against establishing a municipal plant.

The Inland Utilities Company has offered $155,000 for the New Albany (Miss.) municipal light plant, and the Council will accept the offer unless 20 per cent of the voters demand a referendum.

Voters at Raton, N. M., by a vote of 1,285 to 130, have refused to sell its municipally owned electric light plant to the North Continent Utilities Corporation of Chicago.

Some citizens of St. John, New Brunswick, want to sell the city's hydro system to the New Brunswick Power Company, a subsidiary of the Federal Light & Traction Company of New York, and a fight may ensue.

## Plans of Northern Connecticut Power Foreshadowed

On receipt of the news that the Federal Power Commission has granted the Northern Connecticut Power Company the right to build a 50,000-hp. hydro-electric development on the Connecticut River at Windsor Locks, involving the construction of concrete dams on each side of Kings Island with canal improvements and a generating station south of the New York, New Haven & Hartford Railroad bridge, President Walter B. Schwabe informed a representative of the ELECTRICAL WORLD that if the grant is acceptable to the company an installation of four units, aggregating 33,000 hp., will probably be made initially, operating under a head of 30 ft. Nothing definite has been decided as to when construction will begin or how it will be financed. In round numbers the project represents an outlay of approximately $5,000,000, creating a reservoir extending up the river to Holyoke, Mass., and substantially improving navigation facilities.

## New England Credit Men Hold Fruitful Session

Alexander R. McDonald of the Pettingell-Andrews Company, Boston, was elected president of the New England Section of the National Electric Credit Association and Electric Credit Club of Boston on Jan. 17, the annual meeting being held at the University Club. Charles N. Nickerson of the Milhender Electrical Supply Company was elected vice-president and Charles A. Kane secretary and treasurer. At the business session excellent addresses were made by Fred Vose, national secretary, on "Collections"; C. R. Oliver on "Taking an Order," R. A. B. Cook on "Common Law Assignments," and Benjamin A. Atherton on "Receiverships," all three speakers representing Boston firms. Arthur Black, referee in bankruptcy for Suffolk County, Massachusetts, was guest of honor at a dinner following the business session, and an attractive entertainment program was included.

## Ontario Hydro to Go On

*Despite Defeat at "the Soo," Commission Plans to Serve Northwestern Part of Province—Great Lakes Company's Rights on the Montreal Disputed*

NOTWITHSTANDING the decision, recorded last week, of the voters of Sault Ste. Marie, Ontario, to accept the plans of the Great Lakes Power Company for additional energy, the Ontario Hydro-Electric Power Commission is going on with plans for the development of power to meet the industrial needs of the northwestern part of the province. These plans include the development of 12,000 hp. on St. Mary's River, from 125,000 hp. to 140,000 hp. on the Mississagua River and 30,000 hp. on the Montreal River, after which the commission plans to proceed to the Ottawa River to meet any demand in the north for a further supply of electrical energy. Commissioner Maguire expresses confidence that Sault Ste. Marie will regret its decision.

Premier Ferguson of Ontario has definitely declared that the Great Lakes Power Company has no power rights on the Montreal River, where the company is planning the construction of a power plant to supply Sault Ste. Marie. The Premier said: "I have made inquiries and find that there is no record of the Great Lakes Power Company having an assignment of the rights that went with the land grant to the Algoma Central Railway, and even if it had secured such an assignment, it would include no power rights."

## Philadelphia Electric's New Westmoreland Substation

The Philadelphia Electric Company is placing in service a large installation to be known as the Westmoreland substation. This station will serve as a switching center for the 66-kv. system and a connecting link between this system and the 220-66-kv. step-down station at Plymouth Meeting, which, in turn, will be the focal point of the 220-kv. transmission system involving the Conowingo hydro-electric station and interconnection with the Pennsylvania Power & Light Company and the Public Service Electric & Gas Company of New Jersey.

In addition to the 66-kv. development at Westmoreland, there will be a 13.2-kv. outdoor switching station supplied through 60,000-kva. step-down transformers from the 66-kv. system and a structure housing ultimately three 30,000-kva. synchronous condensers, testing facilities, an oil room and operating headquarters. The substation initially will consist of two 100,000-kva. lines from Plymouth Meeting, two 50,000-kva. lines each to the Richmond and Schuylkill stations and two 18,750-kva. lines to 13.2-kv. step-down transformers at the nearby Hunting Park distribution substation. By the fall of 1928 the 13.2-kv. bus and two synchronous condensers will be in service.

## A.I.E.E. Winter Meeting

*Transatlantic Telephony to Be Demonstrated—Lectures by Norinder and Swann—Edison and Fitz Medals to Be Presented to Coolidge and Carty*

SEVERAL events outside the routine technical program, excellent as the latter is, will add special interest to the midwinter convention of the American Institute of Electrical Engineers at New York on Feb. 13-17.

Telephone communication with the British Institution of Electrical Engineers, meeting simultaneously in London, will be established on Thursday morning, Feb. 16, at the telephone session, which will open with two papers on transatlantic telephony. President Bancroft Gherardi will exchange greetings with Archibald Page, president of the British society, and Dr. F. B. Jewett and Colonel T. F. Purves of the British Post Office, who were respectively in charge of the development in the United States and Great Britain of transatlantic service, will also be heard in both countries.

Dr. Harold Norinder of Upsala, Sweden, well known in this country for his studies of lightning discharges and other matters, will lecture on the cathode oscillograph on Tuesday afternoon. On the preceding evening there will be a lecture on "The Earth's Electric Charge" by Dr. W. F. G. Swann, director of the Bartol Research Foundation of the Franklin Institute and a high authority on subjects pertaining to electrophysics. Two of the most highly desired rewards for engineering accomplishment will be presented on Wednesday evening, when the John Fritz medal will be presented to General John J. Carty and the Edison medal to Dr. William D. Coolidge. The presentation ceremonies will include an address by Dr. Michael I. Pupin, who will outline the achievements of Dr. Coolidge; the presentation of the Edison medal by President Gherardi and the response of the medalist; the announcement of the John Fritz medal award by Chairman J. V. W. Reynders of the board of award, an outline of the achievements of General Carty by Mr. Gherardi, the presentation of the John Fritz medal by Robert Ridgway, chairman of the board when the award was made, and the response of General Carty.

Inspection trips to plants of the metropolitan light and power companies, the studio of the National Broadcasting Company, the Electrical Testing Laboratories and the Bell Telephone Laboratories will be held, most of them on Thursday afternoon. The annual dinner-dance is scheduled for Thursday evening at the Hotel Astor, and a smoker for Tuesday evening at the same hotel. Herewith the tentative program of the technical sessions is printed. It shows among included subjects dielectrics, interconnected power-system operation (in discussion of which five prominent engineering executives will describe different practices in the five territories they represent, covering effect on plant capacity and size of generating units, economies of operation, operating features, stability and reliability, load dispatching and load control, technique of interconnection operation, and physical facts as to interstate power), insulators, magnetism, electrical machinery, communication, automatic substations, control and protective apparatus, synchronizing devices and arc welding.

---

## Alabama Power Company Has Budget of $15,000,000

A budget for 1928 totaling approximately $15,000,000 is announced by Thomas W. Martin, president of the Alabama Power Company. The major projects included in the company's construction program are the completion of Jordan Dam on the Coosa River, with 144,000 hp.; the completion of the Upper Tallassee Dam on the Tallapoosa River, with 50,000 hp., and the beginning of the new Warrior steam plant on the Warrior River, to have an initial installation of 80,000 hp., making a total

## Program of Winter Convention of the A.I.E.E.

NEW YORK, FEB. 13-17

### MONDAY, FEB. 13

*Morning.* — Registration; committee meetings.

*Afternoon.*—Electrophysics and Dielectrics: "Surge Impulse Breakdown of Air," J. J. Torok, Westinghouse Electric & Manufacturing Company; "Investigation of the Influence of Internal Vacua and Ionization on the Life Duration of Paper-Insulated High-Tension Cables," Alexander Smouroff, Electrotechnical Institute of Leningrad, Russia; "Approximate Method for Solution of Electrical Networks," E. A. Guillemin, Massachusetts Institute of Technology; "The Boltzmann-Hopkins Principle of Superposition," F. D. Murnaghan, Johns Hopkins University.

*Evening.*—Lecture: "The Earth's Electric Charge," W. F. G. Swann, director of Bartol Research Foundation, Franklin Institute.

### TUESDAY, FEB. 14

*Morning.*—Interconnection and Its Effect on Power Development: "Conowingo-Hydro-Electric Project of the Philadelphia Electric Company, with Particular Reference to Interconnection," W. C. L. Eglin, Philadelphia Electric Company; "Some Problems and Results from Interconnection in the Southeastern States," W. E. Mitchell, Georgia Power Company; "Some Aspects of Pacific Coast Interconnections," P. M. Downing, Pacific Gas & Electric Company; "Interconnection and Power Development in Chicago and the Middle West," H. B. Gear, Commonwealth Edison Company; discussion by Charles L. Edgar, James Lyman, A. C. Marshall, Farley Osgood, E. C. Stone, L. W. W. Morrow, W. S. Lee, C. F. Hirshfeld, G. N. Tidd, H. A. Barre and F. A. Allner.

*Afternoon.*—Miscellaneous Subjects: "The Saturation Permeameter," S. L. Gokhale, General Electric Company; "Manufacture and Magnetic Properties of Compressed Powdered Permalloy," W. J. Shackelton, Bell Telephone Laboratories, and I. G. Barber, Western Electric Company; "Effect of Humidity on Dry Flashover Potential of Pin-Type Insulators," J. T. Littleton, Jr., and W. W. Shaver, Corning Glass Works; **"The Cathode Oscillograph as Used in the Study of Lightning and Other Surges on Transmission Lines," lecture by Harold Norinder.**

### WEDNESDAY, FEB. 15

*Morning.* — Electrical Machinery: "Synchronous Machines—IV," R. E. Doherty and C. A. Nickle, General Electric Company; "Calculation of Armature Reactance of Synchronous Machines," P. L. Alger, General Electric Company; "Reactances of Synchronous Machines," R. H. Park and B. L. Robertson, General Electric Company; "The Thermal Volume Meter," C. J. Fechheimer and G. W. Penney, Westinghouse Electric & Manufacturing Company.

*Afternoon.* — Electrical Machinery (continued): "Recent Improvements in Turbine Generators," S. L. Henderson and C. R. Soderberg, Westinghouse Electric & Manufacturing Company; "Design and Application of Two-Pole Synchronous Motors," D. W. McLenegan and I. H. Summers, General Electric Company; "Heat Losses in the Conductors of a Direct-Current Armature," W. V. Lyon, E. Wayne and M. L. Henderson, Massachusetts Institute of Technology; "Effect of Transit Conditions on Application of Direct-Current Compound Motors," L. R. Ludwig, Westinghouse Electric & Manufacturing Company.

### THURSDAY, FEB. 16

*Morning.*—Communication: "Transatlantic Telephony — The Technical Problem," O. B. Blackwell, American Telephone & Telegraph Company; "Transatlantic Telephony—The Operating Problem," K. W. Waterson, American Telephone & Telegraph Company; "A New Horn-Type Loud Speaker," C. R. Hanna, Westinghouse Electric & Manufacturing Company; "Certain Topics in Telegraph Transmission Theory," H. B. Nyquist, American Telephone & Telegraph Company.

### FRIDAY, FEB. 17

*Morning.* — Control and Protective Equipment and Substations: "Automatic Control of Edison Systems," O. J. Rotty, United Electric Light & Power Company, and E. L. Hough, General Electric Company; "Protection of Supervisory Control Lines Against Overvoltage," Edward Beck, Westinghouse Electric & Manufacturing Company; "1926 Lightning Experience on 132-Kv. Transmission Lines," Philip Sporn, American Gas & Electric Company; "Vacuum-Tube Synchronizing Equipment," T. A. E. Belt, General Electric Company; "Use of Condenser-Type Bushing in Synchronizing," E. E. Spracklen, Ohio Public Service Company, and D. E. Marshall and P. O. Langguth, Westinghouse Electric & Manufacturing Company.

*Afternoon.*—Arc Welding: "Effects of Surface Materials on Metallic Arc-Welding Electrodes," J. B. Green, Fusion Welding Corporation; "Arc Welding—Influence of Surrounding Atmosphere on the Arc," P. Alexander, General Electric Company; "Arc-Welded Structures and Bridges," A. M. Candy, Westinghouse Electric & Manufacturing Company; "Welding and Manufacture of Large Electrical Apparatus," A. P. Wood, General Electric Company.

of 274,000 hp. additional in hydro and steam plants to be in operation by the end of 1928.

Other items will include the addition of 100,000 hp. in step-down primary substations, 200 miles of 154-kv. and 110-kv. transmission lines, 200 miles of low-tension transmission lines and 500 miles of distribution lines.

## Georgia Power Company Will Spend $12,750,000

The Georgia Power Company plans to spend approximately $12,750,000 in Georgia during 1928 — probably the largest expenditure for enlargement and improvement in service ever made in any one year by a Georgia public service company. While the sum named includes street railway and gas expenditures, the bulk of it is for the electric department. The program will provide an additional water-power plant, extension of transmission lines and distribution systems into new territory, wide improvements in street railway and gas service.

Among the major projects planned are a transmission line between Louisville and Waynesboro and one connecting Vidalia, Mount Vernon, Glenwood and McRae; the enlargement of the Boulevard substation in Atlanta and of the substation at Marietta, as well as the construction of several substations and other improvements in Macon, Athens, Rome, Brunswick and elsewhere.

The year 1927 brought the construction of the Burton power plant, completing developments on the Tallulah and Tugalo Rivers; the start of a new 110,000-volt line from Atlanta to the Martin's Dam plant of the Alabama Power Company, the completion of many local lines, and the establishment of 22 retail stores in as many communities.

## Los Angeles Bureau Forbidden to Erect Tideland Plant

Upholding the temporary injunction issued some months ago restraining the Bureau of Power and Light of Los Angeles from constructing a steam-electric power plant on the harbor lands of the city, the Superior Court of Los Angeles County on Jan. 9 made the injunction permanent. This is looked upon as a victory for the Southern California Edison Company, which had brought suit as a taxpayer in the city asking that this injunction be granted. In rendering the decision the court held that the money which had been illegally transferred from the bond fund of the city into the power revenue fund by the Power Bureau must be returned.

The city, apparently anticipating the decision of the court, has acquired another site, and it is understood that the project of a steam standby plant has not been abandoned by it, the court having sustained its right to invest portions of its revenue in such power stations.

## Many Topics Interest Men of Empire State

Financial and economic problems of the electric light and power industry as related to other enterprises were dealt with by H. O. Palmer, president of the Empire State Gas and Electric Association, at the annual meeting of its Electric Section, held at Hotel Niagara, Niagara Falls, N. Y., on Jan. 12 and 13. Water power had a prominent part on the program, the address of Paul S. Clapp, managing director of the National Electric Light Association, on that subject and the fallacies that the public entertain regarding it being heard with much interest.

The report of the apparatus committee, presented by V. J. F. Brain, covered the developments and recent applications of metal-clad switchgear with particular reference to the practices followed by the New York Edison Company. Representatives of the Allis-Chalmers, General Electric and Westinghouse companies discussed the progress of their respective organizations in this field. W. C. Fisher, chairman of the section, pointed out that while the advantages appeared to have been definitely proved, the cost item constitutes the most important deciding factor of use.

Load forecasting, network problems, material specifications, distribution records and desirable voltage practices were discussed by O. G. Whitecotton, chairman, and by sub-chairmen of the overhead distribution committee; various operating problems, design improvements and developments in tools and equipment were considered by T. R. Eilenberg in his report as chairman of the underground systems committee; ice troubles in hydro-electric practice and practical methods of combating them were canvassed by B. E. White of the hydraulic power committee; laboratory data related to lightning phenomena and flashovers were summarized and co-ordinated by W. L. Lloyd of the General Electric Company, speaking on the report of the transmission-line committee, of which S. H. Abbey was chairman, and the operating committee, under W. H. Kiefer, reported upon the condition of insulating oils. The radio co-ordinating committee, under H. F. Bower, also reported.

Paul A. Schoellkopf, president of the Niagara Falls Power Company, delivered the address of welcome. N. R. Gibson and W. K. Bradbury of that company outlined plans for the ultimate development of Niagara Falls and the preservation of its natural beauty. At the dinner and meeting of the Niagara Frontier Section of the American Institute of Electrical Engineers, on Jan. 13, to which members of the association were invited, Prof. Vladimir Karapetoff of Cornell University spoke of "Transients in Time and Space."

A. R. Tremaine of the Associated Gas & Electric Company, Oneonta, and V. J. F. Brain of the New York Edison Company were elected chairman and vice-chairman respectively.

# Briefer News

ELECTRICAL LEAGUE OF COLORADO ELECTS OFFICERS.—B. J. Rowan, executive assistant to the district manager of the General Electric Company at Denver, has just been elected chairman of the Electrical League of Colorado. E. C. Headrick and Dean D. Clark were re-elected secretary and treasurer respectively.

GATINEAU POWER TO COST ONTARIO CITY $8 A HORSEPOWER MORE THAN REGULAR SUPPLY.—The Ontario Hydro-Electric Power Commission has agreed to supply the city of Kingston with all the extra power it needs for the next eight years at $36 per horsepower. The present agreement between the city and the commission still has eight years to run and provides for the supply of power at $24 per horsepower. The new power to be supplied is part of the block which the commission has purchased from the Gatineau Power Company.

ELECTRICAL COMMITTEE OF N.F.P.A. WILL MEET FEB. 14.—The annual meeting of the electrical committee of the National Fire Protection Association will be held in the auditorium of the Consolidated Gas Company, New York, beginning at 9.30 a.m., Tuesday, Feb. 14, and adjourning on Friday of that week. E. Donald Tolles, executive secretary of the Electrical Supply Jobbers' Association, has been named as the representative of that body in succession to Thomas J. Creaghead.

IOWA SECTION, N. E. L. A., WILL HAVE GOOD PROGRAM. — Commercial men and "distribution men" will share the program of the Iowa Section, N.E.L.A., which will meet at Cedar Rapids on Feb. 2 and 3. Lighting, "refixturing," lamp sales, refrigeration, range sales, farm equipment, advertising helps, sales organization set-ups and laundry equipment will be commercial session topics, while the operating men will discuss farm service, transformer equipment, transmission and its regulation, inductive co-ordination, accidents, radio and metering. At the general opening session President C. S. Macy, S. C. Dows, Paul S. Clapp and C. A. Leland will be heard.

SACANDAGA DAM CONTRACT LET.—A contract for the nine-million-dollar Sacandaga dam, by which a body of water with an area as large as Lake George will be impounded in the Sacandaga River Valley at Conklingville, N. Y., to improve the river flow and provide power for industrial purposes, has entered its final stages by the letting of the contract for the construction of the dam to S. J. Groves & Son of Minneapolis for $1,307,086 by the Hudson River Regulating Board. The dam will be 1,000 ft. long, with a spillway 300 ft. long, and 85 ft. high. The contract calls for its completion by Dec. 31. Of the assessment 95 per cent will be paid by the power companies deriving benefit and 5 per cent by the cities of Albany, Troy, Watervliet and Rensselaer, which receive flood protection.

Joliet, Ill., Will Have New Utility Building. — The Public Service Company of Northern Illinois announces that work will begin in April upon a four-story unit of a proposed ten-story tower building at Ottawa and Cass Streets, Joliet, to provide office and sales department space. The unit will cost approximately $400,000, and the completed building will represent an investment of $1,000,000. The company hopes to have the unit completed within a year.

Duquesne Light Company to Cut Rates on Feb. 1.—Residential wholesale and retail consumers of electrical energy furnished by the Duquesne Light Company, Pittsburgh, will pay after Feb. 1 $700,000, or 3 per cent, less annually for the same service as formerly, according to an announcement by President A. W. Robertson. The revised code, Mr. Robertson said, is made possible by the great increase in the consumption of electrical energy and by economies in operation. It eliminates the necessity of checking the number of outlets or rooms in homes of seven rooms or less.

Double Industrial Hydro Unit at Fulton, N. Y., Will Have Rating of 100,000 Hp.—A large hydro-electric development on the Oswego River in New York State will be completed early this year with the linking into one unit of the power plants on both banks of the river at the upper falls dam at Fulton, N. Y. This plant, which is owned by the Oswego Falls Paper & Pulp Company, is planned to develop about 100,000 hp. from an 18-ft. head. It was made possible by the purchase two years ago of the American Woolen Mills power plant at the west end of the dam, which when completed will operate in unison with the Oswego Falls plant.

Supplementing New Hampshire Hydro Power with Steam.—The 14,000-hp. steam boiler installed by the Public Service Company of New Hampshire at Kelley's Falls in 1927 has given this station capacity to carry the electric load for Manchester, Keene, Nashua and Dover. Water power from the Piscataquog River is sufficient to operate the hydro plant at Kelley's Falls only three months of the year, but the steam installation will make it possible to provide the necessary power during the rest of the year. The Twin State Gas & Electric Company, Dover, N. H., is getting a good portion of its energy from the Kelley's Falls plant.

Conference of Utility Association Secretaries Outlines Purposes.—At the National Conference of Utility Association Secretaries held recently at Oklahoma City the organization, which has been functioning informally for about five years, adopted the name just given and issued the following statement of its objectives: "To study the possibilities, economy and effectiveness of service to the utility industry realized through its established associations; to disseminate those ideas of organization and administration of association affairs which have been proved of merit, and to promote a spirit of unity of purpose and co-operation of effort among the various state, regional and national utility associations."

Oregon's New Law Regulating Permits for Hydro-Electric Developments.—According to the Oregon State Engineer, intended results are now being obtained from the passage in 1927 of an act which provides for prohibition of filings on water resources of the state for purely speculative purposes. The new law, which limits passive applications to a six-month period, has brought about the cancellation of several preliminary permits for the development of electric power, among them one involving Marion Lake. The water rights of this project are still in the hands of the original filer, however, owing to his immediate action in filing preliminary papers with the Federal Power Commission.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

**National Electrical Manufacturers' Association — Supply Division, Hotel Commodore, New York, Jan. 23-27. S. N. Clarkson, 420 Lexington Ave., New York.**

**New England Central Station Association of Power Engineers—Chamber of Commerce, Boston, Jan. 25. T. D. Bond, C. H. Tenney & Co., Boston.**

**Artistic Lighting Equipment Association—Winton Hotel, Cleveland, Jan. 25-28. G. P. Rogers, 711 Graybar Bldg., New York.**

**Northwest Association of Electrical Inspectors—Olympic Hotel, Seattle, Jan. 26-28. F. D. Weber, 414 Lumbermen's Building, Portland, Ore.**

**Iowa Section, N.E.L.A.—Roosevelt Hotel, Cedar Rapids, Feb. 2 and 3. H. E. Weeks, Davenport, Iowa.**

**American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16; St. Louis regional meeting, March 7-9. F. L. Hutchinson, 33 West 39th St., New York.**

**Rocky Mountain Division, N.E.L.A.—Albuquerque, N. M., Feb. 14-16. O. A. Weller, 900 15th St., Denver.**

**Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.**

**Iowa Power Conference—University of Iowa, Iowa City, Feb. 15 and 16. Joe Carmichael, Iowa Committee on Public Utility Information, 310 Crocker Bldg., Des Moines.**

**Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21; Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.**

**Oklahoma Utilities Association—Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.**

**Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.**

American Engineering Council Officers. — Besides the election of A. W. Berresford as president, noted last week, the following vice-presidents were chosen by the American Engineering Council at Washington: L. P. Alford, New York; O. H. Koch, Dallas; I. E. Moultrop, Boston, and G. S. Williams, Ann Arbor, Mich. John H. Finney, M. M. Fowler, H. A. Kidder, Farley Osgood, C. F. Scott and C. E. Skinner will represent the A.I.E.E. on the administrative board, and Alex Dow heads the representation from the A.S.M.E.

Carrying 110-Kv. Line Across the Connecticut River.—The first span of the New England Power Company's 60-mile, 110,000-volt transmission line from the Bellows Falls (Vt.) plant to Pratt Junction, Mass., is yet to be strung. This span crosses the Connecticut River and involves an engineering problem because of its extreme length. The wires will reach the first steel tower high up on Mount Kilburn on the New Hampshire side, a span of 2,080 ft. The entire line requires 375 67-ft. towers and the average span is 843 ft.

First Electrically Propelled Packetboat.—Another field for electric ship propulsion will be opened with the completion of an electrically propelled packetboat now being built for the Middlesex Transportation Company of New Brunswick, N. J. This boat will have a capacity of 250 tons of package freight and will operate at a speed of 12 miles per hour. It will run between New Brunswick and New York City and will supplement an extensive trucking business carried on by the owners. Electric equipment will be supplied by the General Electric Company.

Nebraska Farmers Drop Co-operative Plan for Private Service.—The Sunflower Farmers' Electric Light District in Nebraska, recently organized by land owners in the North Platte Valley for the purpose of issuing bonds and using the proceeds to build a distribution system for electrical energy to be purchased from the government development at Lingle, has been dissolved. Manager McFadden of the Western Public Service Company, which has lines through that section, offered to furnish the farmers with energy at stipulated rates, based on use, over the company's system, and this offer proved more attractive. The company agreed that for a bonus of $200 from each of at least 22 land owners it would build and operate the system and charge approximately town rates.

Progress in Kentucky in 1927.—In 1927, L. B. Herrington, president Kentucky Utilities Company, reports, that company built 30 miles of 66,000-volt, 97 miles of 33,000-volt and 48 miles of lower-voltage lines. A hydro-electric plant is under construction at Lock No. 7 on the Kentucky River and will be completed next summer. The company has also completed more than half of a double-circuit steel-tower line of 66,000-volt capacity, 36 miles long, between Morganfield and Earlington. When ready for operation, some time in March, this line will have cost approximately $280,000.——T. B. Wilson, vice-president Louisville Gas & Electric Company, says that the early opening of the company's hydro-electric plant at the Falls of the Ohio will be the biggest event on its 1928 program. Operation of the project will mean that Louisville will have available year-round navigation upstream as far as Pittsburgh, for the government's two-and-a-half-million-dollar dam was linked with the hydro project.

**Power Company and Skagit Municipal System May Be Connected.**—The Great Northern Power Company, which is developing hydro-electric power on the Wallace, Olney and Sultan Rivers in Snohomish County, Wash., has asked the Seattle City Council to consider interconnection between the company's line and the city's Skagit system, and the city will consider the proposal. The Great Northern Company has acquired water and land rights in Snohomish County and within the next 60 days expects to have a 2,000-kw. plant ready on the Lower Olney River. This will be enlarged to a 42,000-kw. installation, and ultimately the company hopes to develop 120,000 kw.

**Metaline Falls Project Strikes a Snag.**—The State of Washington cannot issue a permit for the development of hydro-electric power with restrictive qualifications, as requested by Hugh L. Cooper in applying for the right to develop a site at Metaline Falls, "Z" Canyon, in northeastern Washington, Assistant Attorney-General B. B. Adams has ruled. (See Electrical World for Jan. 7, page 71). The application, made for the Pend Oreille Lead & Zinc Company of Spokane, was for 7,000 sec.-ft. of water in the Clark's Fork branch of the Columbia River, with a provision that an additional 1,500 sec.-ft. might be used for 50 years and then become permanently available if not needed by the Columbia Basin irrigation project.

**New Plant for West Texas Utilities.**—Construction will soon begin on a West Texas Utilities Company power plant which, when completed with its full complement of three units, will cost more than $5,000,000. The plant will be built on Lake Pauline, 5 miles southeast of Quanah. The first unit will have a capacity of 20,000 hp., and when the plant is completed there will be a capacity of 60,000 hp. To the company's San Angelo plant a 9,000-hp. unit is being added. These, together with the 40,000 hp. now installed, will give a total rating of 109,000 hp. Four transmission lines will leave the plant. One of these will connect with the transmission line leading through Crowell to the central system of the West Texas Utilities Company. One will lead to Quanah, one to Childress and the fourth to Vernon, permitting interconnections with the Texas Electric Service Company at Wichita Falls and the Southwestern Light & Power Company at Lawton, Okla. The West Texas Utilities came into existence less than seven years ago at Abilene, Tex.

**Expansion at Asheville, N. C.**—The Carolina Power & Light Company will spend about $400,000 in Asheville, N. C., and vicinity for improvements and expansions in 1928, according to C. S. Walters, general manager of the company. This work does not include the large hydro-electric power plant which is being developed on the Pigeon River near Waterville, 50 miles west of Asheville, and is scheduled for completion in 1930 at a cost of $11,000,000, of which about $3,000,000 has already been spent. The appropriations for 1928 include $200,000 for transmission-line extensions and an equal amount for other equipment and for substations.

## Commission Rulings

**Railways Not Electrical Corporations.**—A complaint by the receiver of the Second Avenue Railroad Company in the city of New York with reference to rates for electricity charged by the Interborough Rapid Transit Company and the New York Railways Corporation has been dismissed by the New York Public Service Commission for lack of jurisdiction. The commission held that the transit companies furnishing electricity to the Second Avenue Railroad Company were not electrical corporations within the meaning of the New York statutes, although they sold part of their surplus power to electric railways. The commission said that in respect of the furnishing of electric service these corporations lacked the usual attributes of public service corporations and were not subject to the usual obligations of public service corporations; that it was not pretended that these corporations held themselves out as purveyors of electricity generally, or that they could be compelled to furnish electricity to the public generally, or that if they were to cut off service they could be compelled to restore it.

**Irrigation Company Ordered to Make Survey for Possible Power Plant on Site Controlled by It.** — In a ruling affecting the Public Water Company, which irrigates land in the Rogue River Valley, the Oregon Public Service Commission said: "Our engineers have made an examination of the utility property and have called the management's attention to the existence of certain potential water power at what is known as Bradshaw's Drop. It is the duty of the utility, in equity to its consumers, to expend every endeavor to increase its revenues wherever possible. Apparently no effort has been made to develop or dispose of this power, which in our opinion would be a source of considerable revenue. Obviously, good business management would have required this to be done long before. The utility will be required to make a survey of the possible development and disposal of this power and file a report within 90 days."

## Recent Court Decisions

**Franchise Rights Unimpaired Where City Refrained from Enforcing Tax Provisions.**—In an injunction proceeding by the Fort Worth Gas Company against a rival utility the Court of Civil Appeals of Texas held that the defendant's franchise rights were not impaired by the fact that the city had never enforced a forfeiture of franchise because of the rival company's failure to pay a tax on its gross earnings as required under the ordinance and had in lieu thereof assessed an ad valorem tax, nor by the further fact that the franchise had not been authorized by the voters in accordance with a provision in the city charter, since the company's state charter did not require any consent beyond that of the governing body of the city. (299 S.W. 705.)*

**Interpretation of Pennsylvania Statute Permitting Borough to Purchase Electric Utility.** — The statutes of Pennsylvania provide that a borough may purchase the works of any company furnishing electric light to it or the public at such price as may be agreed upon by the borough and the majority in value of the stockholders of such corporation, and that upon failure so to agree the borough may present a petition to the Court of Common Pleas asking for the appointment of viewers to assess the value of the plant and works so taken. The borough of Brookville attempted to condemn and appropriate the property and franchises of the Solar Electric Company. On appeal by the company from an order of the Court of Common Pleas dismissing its exceptions to the report of viewers, the Pennsylvania Supreme Court held that the statute did not directly or by necessary implication confer power to condemn and appropriate said electric light works, but was confined to the purchase of the works when there was a willingness to sell or authority to fix a price where this was in dispute. (138 At. 845.)

**Telephone Company Wins Important Wiring Case.**—A decision has just been made by the Massachusetts Supreme Court in favor of the New England Telephone & Telegraph Company and against the Massachusetts Department of Public Utilities and the Hotels Statler, Inc., in connection with the right of the company to insist on the wiring of telephone installations by telephone employees. The commission had ordered the company to provide service in the Statler Building over wires pulled through interior conduits by union workmen not employed by it. While complying with this order, the company maintained that its responsibility for its service and agreement with its own forces, not affiliated with the union organization, justified it in refusing to supply service over wires not pulled by its own employees, and also that the order of the commission was an interference with interstate commerce. The court coincided with this view and said that the order of the commission requires the company to become the owner of property which later it may be obliged to reject because incompatible with the service it undertakes to give.

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# News About Men of the Industry

## W. J. Canada Joins N.E.M.A.

W. J. Canada, who has served for the last few years as electrical field secretary of the National Fire Protection Association, has resigned to join the National Electrical Manufacturers' Association with headquarters in New York. Mr. Canada has been prominent in electrical circles for many years.

Following graduation from Sheffield Scientific School at Yale, he entered the testing department of the General Electric Company, but subsequently affiliated himself with the Ohio Electric Railway Company. Later in his career Mr. Canada took up safety work as electrical engineer of the Rocky Mountain Fire Underwriters' Association, resigning in 1913 to become associate physicist for the Bureau of Standards, Department of Commerce, where he made a special study of electrical life hazard. Subsequent connections followed with the American International Shipbuilding Corporation of Philadelphia and Stone & Webster before he became head of the engineering department of the National Electric Light Association in New York. In this connection Mr. Canada paid particular attention to questions of inductive interference, insurance, the safety code and work with special technical committees of the association. In his new position Mr. Canada will correlate and direct general engineering matters.

---

**John M. Costello** has been appointed executive manager of the new Niagara, Lockport & Ontario Power Company, recently formed through the merger of the old Niagara, Lockport & Ontario Power Company and the Western New York Utilities Company, with headquarters in Batavia. Mr. Costello was identified with the old Niagara, Lockport & Ontario organization for sixteen years, having entered its employ in 1911 in the stores department.

**Owen D. Young**, chairman of the board of directors of the General Electric Company, was elected chairman of the Economic Foundation, succeeding Thomas W. Lamont, whose term as a member of the board of trustees has expired. The Economic Foundation is a trust established in 1923 to administer funds given or to be given for investigations in the field of economic, social and industrial science.

P. C. **Brooks** was elected a vice-president of Fairbanks, Morse & Company at a recent meeting of the board of directors. During a connection of 29 years with the organization, Mr. Brooks has held many positions of responsibility, and, in addition to his present office, he is president of E. & T. Fairbanks & Company, the scale manufacturing subsidiary of Fairbanks, Morse & Company. He is also vice-president of the Canadian Fairbanks-Morse Company, Ltd.

---

## *J. C. Guild New Manager of Tennessee Utility*

Jo Conn Guild, Jr., who has been named general manager of the Tennessee Electric Power Company to succeed the late B. C. Edgar, as announced in the Jan. 7 issue of the Electrical World, is widely known in Nashville, Chattanooga and throughout the state and his appointment was no surprise to those who had followed his career in the public utility field. Upon leaving Vanderbilt University in 1908, Mr. Guild immediately engaged in construction work at the Hales Bar power plant, one of the outstanding engineering achievements of its character in the South at that time.

J. C. GUILD

Immediately thereafter, in 1913, Mr. Guild entered the employ of the Chattanooga & Tennessee River Power Company in Chattanooga in new-business development work, with special attention to the sale of electric power to the new and expanding industries in his home city. In 1915 he was made general manager of the company. In 1922 the Chattanooga & Tennessee River Power Company was consolidated with the Chattanooga Railway & Light Company and Tennessee Power Company into the Tennessee Electric Power Company, Mr. Guild becoming vice-president of the combined companies.

His contacts with the public in general early made Mr. Guild a firm believer in the policy of maintaining good public relations between the power company and the customers it serves. He frankly advocated the widest possible dissemination of information regarding the affairs, policies and progress of the Tennessee Electric Power Company through the press. The new executive has been closely associated with the late Mr. Edgar in all of the operating problems and policies of the company and is considered fully qualified by experience, ability and training to take over the managerial reins.

---

**Matthew S. Sloan**, president of the Brooklyn Edison Company, addressed a group of bankers in Philadelphia on Wednesday, Jan. 18, and another group of bankers on Thursday, Jan. 19, in Pittsburgh. Taking as his subject the national legislative problems confronting the electrical industry in Washington, Mr. Sloan referred to the Walsh investigation, the Boulder Dam bill and the Muscle Shoals situation.

S. **Fred Smith**, for 36 years manager of the Salem (Mass.) Electric Lighting Company, has been appointed vice-president of that utility. Mr. Smith is a past president of the New England Division of the National Electric Light Association and is one of the most widely known managers of properties in the Tenney group. John L. Tudbury, manager of the Salem Gas Light Company, a recent addition to the Tenney list, has been made manager of the Salem Electric Lighting Company. He will remain manager of the gas company.

S. McN. **Johnston** has resigned his position as vice-president and general manager of the Pittsburgh Transformer Company. The illness of one of his children necessitated his residing in Phoenix, Ariz., temporarily and Mr. Johnston decided with regret to sever his connections with the electrical industry for a period in order to devote his efforts to his family. His many friends will regret his absence and hope the early recovery of his child will bring him back to electrical affairs. Mr. Johnston has been affiliated with the Pittsburgh Transformer Company for ten years and was a part owner until that company was purchased by the Allis-Chalmers Manufacturing Company in May, 1927.

H. **Hobart Porter**, president of the American Water Works & Electric Company, sailed Jan. 14 on the *Laconia* for a three-month cruise to South Africa. The tour, which will take Mr. Porter through the hunting country of South Africa northward to Cairo, is purely a pleasure trip.

M. L. **Hibbard**, who has been chief operating engineer of the Northern States Power Company for more than four years, has severed his connection with the Byllesby organization to affiliate himself with the Electric Bond & Share Company, New York. Though a Canadian by birth, Mr. Hibbard has spent the major portion of his engineering career in the United States. Following graduation from McGill University, he entered the test course of the General Electric Company at Pittsfield, Mass., but later returned to Montreal as an employee of the Montreal Street Railway. After engaging in consulting and construction work, he became superintendent of electric distribution for the Union Light, Heat & Power Company, Fargo, N. D., and after a period of four years removed to San Antonio as electrical engineer for the San Antonio Traction Company and the San Antonio Gas & Electric Company. He became identified with the Byllesby interests in 1911, when H. M. Byllesby & Company took over the Union Light, Heat & Power Company, to which he returned as general manager.

# Obituary

**William Schwanhausser**, chief engineer of the Worthington Pump & Machinery Corporation, died Jan. 15 in Peck Memorial Hospital, Brooklyn, N. Y., after an extended illness. A native of Bavaria and a graduate of the Polytechnic Institute in Mittweida, Saxony, he entered the employ of Osterheld & Eichmeyer, Yonkers, N. Y., after removing to this country, assisting in the development of engines, pumps, motors and other machinery. It was in 1885 that he took charge of the making of trade pumps for the Worthington works, then in Brooklyn. In the course of this association he introduced successfully the Worthington products in Europe, and in 1895 he was selected to direct the company's plant in Germany. Mr. Schwanhausser was 73 years of age.

**Henry T. Winchester**, electrical engineer, died suddenly Dec. 30 as the result of injuries sustained in an automobile accident near Detroit. A native of Boston and a graduate of the Massachusetts Institute of Technology, Mr. Winchester was formerly identified with Stone & Webster. He removed to Detroit and, at the beginning of the World War, took charge of construction at Camp Custer, Battle Creek, Mich. Later he was placed in charge of construction work at the Hog Island Navy Yard as division superintendent for Stone & Webster, but returned to Detroit as a construction and consulting engineer. Recently he was elected vice-president of the Apex Coal Company of Chicago.

**Ralph M. Obergfell**, associate electrical engineer of the Underwriters' Laboratories, Chicago, died Jan. 10, of pneumonia, after a brief illness. Mr. Obergfell was born in Chicago in 1888 and received his technical education at the Lewis Institute. Since 1914 he had been associated with the electrical department of the Underwriters' Laboratories with the exception of about a year and a half when he was with the American Expeditionary Forces in France. For the last few years he had been at the head of the electrical department in Chicago.

**George W. Mathews**, superintendent for the Foundation Company of New York, builder of the Insull power plant at Pekin, Ill., died of pneumonia Jan. 3 in his home in the latter city after a week's illness. He was 39 years old. Mr. Mathews had removed to Pekin last March to take charge of construction of the new power project and had made rapid progress with the work. He had been associated with the Foundation Company a number of years.

## *Prof. E. E. F. Creighton*

**Elmer E. F. Creighton**, electrical engineer with the General Electric Company, who was for years the company's expert on lightning protection, died Jan. 13 in Ellis Hospital, Schenectady. He had been identified with the General Electric Company since 1904 and during this period was a close technical associate of the late Dr. Charles P. Steinmetz. In the course of his engineering career Professor Creighton devoted much time to high-tension and lightning protection investigations, and during the last few years he had been engaged in special research work for the general engineering laboratory. An inventor of many protective devices for electrical systems, he held a total of 66 United States patents.

E. E. F. CREIGHTON

A native of California and a graduate of Leland Stanford University, Mr. Creighton rounded out his technical education at the Sorbonne in Paris and at the École Supérieure d'Electricité. Following his return from Paris in 1900 he again joined the staff at Leland Stanford to continue the teaching he relinquished to go abroad. One year later he transferred his interests to the East as head of the experimental department for the Stanley Electric Manufacturing Company at Pittsfield, and when the Stanley organization was taken over by the General Electric Company in 1904 he removed to Schenectady. From 1904 to 1906 Professor Creighton was assistant to Dr. Steinmetz, who was head of the electrical engineering department at Union College, and it was at this interval that an experimental laboratory, conducted by these two and others of the faculty, but designed to serve the needs of the General Electric Company, was established. The research work was continued at the college until 1913, when the laboratory was moved to the Schenectady plant of the General Electric Company, where it has since remained.

Professor Creighton was a fellow of the American Institute of Electrical Engineers and served on many technical committees, including that on meetings and papers. He was also a member of the American Society of Mechanical Engineers, the Society for the Promotion of Engineering Education, the American Electrochemical Society, the American Academy for the Advancement of Science, the American Physical Society and other technical organizations.

**W. C. Chappell**, electrical engineer, died late in November, 1927, in Monrovia, Cal., after a long illness. In the course of his engineering career Mr. Chappell visited Scotland, Austria, England, his native land, Canada and the United States. While in America he served as erecting engineer for the Columbia Electric Railway, in the same capacity with the General Electric Company in Philadelphia, and subsequently with Gay & Son, Los Angeles, as design engineer. Mr. Chappell was a member of the American Institute of Electrical Engineers.

**Lewis P. Mead**, president of the Mead Electric Company, Ltd., electrical engineers and contractors, Montreal, died at his home in that city Dec. 28, in his sixtieth year. Mr. Mead was born in Providence, R. I., and moved to Montreal in 1897 to take up the position of factory superintendent of the Eugene F. Phillips Electrical Works, Ltd. In 1910 he formed the Mead Electric Company, Ltd. He was for some years a lecturer in electrical engineering at the Montreal Technical School.

**Robert Miller**, general manager for the General Electric Company in the Rocky Mountain States, with headquarters at Denver, died Jan. 5, after a short illness. He was 48 years of age. Mr. Miller started with the General Electric Company in the East, was made sales manager at Salt Lake City in 1911 and about two and one-half years ago was advanced to the position he held at the time of his death.

**A. F. Meservey**, formerly general manager of the Fort Dodge (Ia.) Light & Power Company, died Jan. 3 in his home in Long Beach, Calif., where he had made his home since his retirement from active life twelve years ago. Mr Meservey was 77 years of age.

# Financial and Statistical News

### *Utility Markets Inactive*
### *Money Rates Firm*
### *New Financing Active*

PUBLIC utility securities for the most part have shared the inactivity which has characterized the greater part of the securities markets this week. Few price changes of any great significance are recorded, although averages are marginally higher than a week ago.

Money rates are again a subject of special interest in relation to current market movements. Hardening of rates at the beginning of the year is contrary to precedent. The tendency during recent years is the reverse, and factors governing the money market at this time of year would normally be expected to produce ease rather than firmness. The situation is, therefore, connected with the more or less uncertain effect of the expansion in brokers' loans, and this revives the question of the policy of the Federal Reserve banks in this connection. In any event, current firmness of funds and anticipation in certain quarters of increased firmness have had a definite slowing-up effect in the markets.

Bond prices continue in active demand with firming prices. The volume of new financing has again struck its pace, as indicated by the large number of new issues which have come forward this week and last.

## New Twenty-Million-Dollar German Loan to Be Floated

Negotiations for a twenty-million-dollar loan for the Westphalia United Electric Power Corporation of Germany have been closed and public offering is expected in the near future. Proceeds of the issue will be used for extensions to the plant.

## Week's New Issues Total Almost $50,000,000

The largest issue of the year up to the present is $36,000,000 of 5 per cent debentures, series A, of the Continental Gas & Electric Corporation. The issue, which was sold at 95½ and accrued interest to yield about 5.30 per cent, is for the purpose of retiring all of the company's outstanding securities except its 7 per cent prior preference stock and 110,000 shares of $7 preferred stock, series A, of the Kansas City Power & Light Company, a subsidiary.

An issue of $2,400,000 collateral trust 6 per cent bonds, series A, of the United Public Service Company was also sold this week. The funds are to be used for the purpose of acquiring additional subsidiary securities, as provided in the indenture. The United Public Service Company owns all of the capital stocks of a group of subsidiaries serving communities in Ohio, Indiana, South Dakota, Kentucky, etc. The bonds were sold at 98 and interest to yield over 6.20 per cent.

The National Electric Power Company sold an issue of $10,000,000 of 5 per cent gold debentures this week, to be used in the retirement of the company's 6 per cent secured gold bonds. The issue was sold at 94½ and interest to yield over 5.30 per cent.

Financing was carried out during the week also by one of the Duke-Price interests in Canada, the Saguenay Electric Company. This company sold $1,360,000 of 5½ per cent first mortgage and collateral trust bonds. Saguenay Electric has acquired a number of power and light companies in Quebec.

## Power Corporation Changes Set-Up

The stockholders of the Power Corporation of New York at their annual meeting on Jan. 10, held at the offices of the St. Regis Paper Company, voted to reduce the number of shares of both preferred and common stock. It was decided to reduce the total number of shares from 850,000 to 820,000. Under the old plan the company had 750,000 shares of common and 100,000 shares of preferred stock. Under the new plan the concern will have 750,000 shares of common and 70,000 shares of preferred stock. All of the directors of the company were re-elected to serve another year.

# California Commission Exercises Rigid Supervision

ANY existing feeling that the supervision of public utility commissions is not sufficiently rigid is refuted in so far as California is concerned by the commission's report, recently issued. Analysis of the report shows that since its inception the commission has denied applications to issue approximately $110,000,000 and dismissed applications to issue $116,500,000, or a grand total of more than $226,000,000. The result of this action is to protect investors and the consumers of public utility service, and it is evident that the commission is not evading its veto duty in regard to new issues. According to records, the commission granted permission for the issue of $252,323,000 of stocks, bonds and notes and other evidences of indebtedness during 1927, as against $158,012,000 in 1926.

Tabulations for the past year indicate that although a considerable volume of bonds was authorized, the year was especially favorable for stock financing, the amount of stock authorized increasing from $50,576,000 in 1926 to $151,562,730 in 1927. It appears from applications filed with the commission that not only was more stock sold, but the issuing companies were able to dispose of it more readily at higher prices and under better terms than previously. The amounts authorized during the past two years, exclusive of $247,000,000 which was for reclassification of the capital stock of the Pacific Gas & Electric Company and Southern California Edison Company, are classified by years and main groups as follows:

As usual, the bulk of the securities were authorized to be issued by gas and electric companies and for additions, betterments and construction purposes. While few new units of electric production capital were started during the year, a considerable volume of work and money was expended on construction programs, commenced in earlier years of generating expansion, the Southern California Edison Company proceeding with its Big Creek development and its Long Beach steam plant, Feather River Power Company with its Bucks Creek project, San Joaquin Light & Power Corporation with its Kings River development, Pacific Gas & Electric Company and Sierra & San Francisco Power Company with their Tuolumne development and the California Oregon Power Company with its Prospect plant on the Rogue River. The various applications filed with the commission indicate increasing expenditures for distribution facilities to meet demands for service from an ever-increasing number of consumers.

At the beginning of 1928 applications were pending before the commission involving requests to issue $43,734,803 of securities, and it appears from these undecided matters and from construction budgets filed by some of the companies that the commission will be called upon during the coming year to pass on a large volume of securities to enable the continuance of the development and expansion of California's public utilities which is demanded by the steady growth that has taken place.

LAST TWO YEARS' UTILITY FINANCING IN CALIFORNIA

| | Stocks | Bonds | Notes | Other Evidences of Indebtedness | Total |
|---|---|---|---|---|---|
| 1926 | $50,576,067 | $103,406,600 | $1,789,854 | $2,150,000 | $158,012,521 |
| 1927 | 151,562,730 | 197,334,300 | 3,126,163 | 300,000 | 252,323,193 |

## American Gas & Electric Sells All but Electric Utilities

The American Gas & Electric Company has sold several railway and bus properties in Portsmouth and Ironton, Ohio; Ashland, Ky.; Huntington, W. Va., and Wildwood, N. J. The company retains the electric light and power properties in these centers. The sale of these companies leaves American Gas & Electric with gross receipts of subsidiaries derived almost entirely from electric power and light operations.

## Common Dividend Increased by Middle West Utilities

Directors of the Middle West Utilities Company on Jan. 10 passed a resolution to the effect that, starting with the common dividend, payable May 15, quarterly distributions at the rate of $7 per share per annum will be made. This will mean that the 7 per cent preferred stock will go on an 8 per cent annual dividend basis beginning April 15. The regular quarterly dividend of $1.50 per share has been declared on the common stock (no par value), payable Feb. 15 to holders of record Jan. 31. This dividend rate has been paid since May 15, 1926, inclusive.

## Stock Exchange in New York Consolidation

The certificate of consolidation, made a part of the petition for the consolidation of the Niagara, Lockport & Ontario Power Company and the Western New York Utilities Company, Inc., under the name of the Niagara, Lockport & Ontario Power Company, states that the new corporation is to have 827,500 shares of stock, of which 500,000 shares will be preferred stock, par $25, and 327,500 shares of no-par-value common stock. Holders of preferred stock, par $100, of the Niagara, Lockport & Ontario Power Company are to receive under the proposed consolidation 4⅜ shares of preferred stock of the new company, in exchange for each share now owned. Preferred stockholders of the Western New York Utilities Company, Inc., are to receive $2.50 in cash and four shares of preferred stock of the new company, also the sum of 58⅓ cents in lieu of dividend for December, 1927. Holders of the 300,000 shares of common stock of the Niagara, Lockport & Ontario Power Company and of the 27,500 shares of common stock of the Western New York Utilities Company, Inc., are to receive common stock of the new company on the basis of share for share.

## Duquesne Light to Change Capitalization

Stockholders of the Duquesne Light Company will meet March 10 to vote on converting 250,000 shares of 8 per cent cumulative participating preferred stock, series A, of $100 par value, into 1,000,000 shares of common stock without par value, and converting the 250,000 shares of $100 par value common stock into 1,000,000 shares of no-par common, making a total of 2,000,000 shares outstanding. Stockholders of the company at the same time will vote on the proposal to increase the common from 2,000,000 to 4,000,000 shares and to issue $50,000,000 of 5 per cent cumulative first preferred stock.

## Canadian Companies Issue Annual Reports

The fourth annual report of the Ottawa & Hull Power Company, Ltd., recently issued, covering the twelve months ended Oct. 31, 1927, reveals a year of further satisfactory progress. Gross revenue for the twelve months amounted to $398,795. In the preceding period of fourteen months the gross revenue was $446,540, equivalent to a rate of $382,748 for twelve months. Expenses and taxes for the year under review were actually lower than those for the preceding period, which was longer by two months. Bond interest and preferred dividends were proportionately smaller. After these deductions there remained a surplus of $46,725. Gross revenue of the Ottawa River Power Company, Ltd., a subsidiary of the Ottawa & Hull Power Company, for the twelve months ended Oct. 31, 1927, amounted to $356,126, as against $274,953 in the preceding fiscal year, which comprised only ten months of operation. After deducting expenses and taxes, interest charges and depreciation reserve there remained a surplus for the year of $15,386, which was added to the previous surplus of $1,699, making a total of $17,086.

---

BRAZILIAN TRACTION ON $7 BASIS.—Brazilian Traction, Light & Power Company, Ltd., declared a quarterly dividend of $1.75 on the present $100 par common, placing the stock on a $7 basis, against $6 previously. Stockholders approved an increase in the authorized common shares to $200,000,000, from $120,000,000, and issuance of additional common stock to stockholders at $100 a share on basis of one new share for each five held, to be followed by a four-to-one split-up of all the common. The new common will be of no par value.

---

TOKYO STOCKHOLDERS RATIFY CONSOLIDATION.—Stockholders of the Tokyo Electric Light Company and the Tokyo Electric Power Company have ratified a proposal for the consolidation of the two companies. The consolidated organization will have a paid-in capital of more than $20,000,000 and a funded debt of about $100,000,000. The consolidated company is the largest corporation in Japan and one of the largest public utility operating companies in the world. It will operate at wholesale and retail in a territory comprising 13,000 square miles and having a population of 10,000,000, or nearly one-sixth of the population of Japan proper.

# 1927 General Production 2 Per Cent Over 1926

*Less than Normal Seasonal Decrease During December — Rolling Mills, Steel Plants and Automobile Industries Report Increased Operations Over November*

THAT the volume of general production during 1927 as a whole was about 2 per cent above that of 1926 is indicated by reports on electrical energy consumption received by the ELECTRICAL WORLD from approximately 3,000 large manufacturing plants scattered throughout the nation and in various industries, plants consuming more than 15,000,000,000 kw.-hr. of electrical energy per annum. The basic figures indicate that seven of the primary industrial groups—rolling mills and steel plants, leather and its products, textiles, lumber and its products, paper and pulp, rubber and its products, and the food and kindred products industries—turned out a volume of products greater than that in 1926, although in some of the groups the increased volume was very slight. On the other hand, five just as important industrial groups—ferrous and non-ferrous metal-working plants, automobiles, stone, clay and glass, chemicals and allied products and shipbuilding—were operating during the year as a whole at a lower rate than in 1926. When these various industrial groups are weighted in accordance with their importance in the national industrial structure, the rate of operations in general industry during 1927 is found to have been 2 per cent more than that of 1926.

The year closed with general industry operating at a rate of about 8 per cent greater than in December of last year. The low activity for December, 1926, was due largely to the depressing influence of operations in automobile manufacturing, both in the production of new cars and trucks and in the manufacture of automobile equipment and replacement parts. There was a very noticeable increase in the productive operations of these plants during the current December, an increase in operations of about 5.7 per cent being indicated. The rolling mills and steel plants also slightly increased their rate of activities during December, these two industrial groups—automobiles and rolling mills—being the only two industries to report an increased rate of operations during December over November. When the various industrial groups are weighted in accordance with their importance, the rate of operations of general industry during December is found to have been about 4.5 per cent less than in November, which is a materially smaller seasonal decrease than was witnessed during December, 1926.

---

QUEBEC POWER STOCK ON $2 DIVIDEND BASIS.—Directors of the Quebec Power Company have declared a quarterly dividend of 50 cents a share on the outstanding 400,000 shares of capital stock, no par value, payable Jan. 16 to holders of record Dec. 31. This is equivalent to $2 per share on the old capital stock of $100 par value, which was recently split up on a basis of four new shares for one old share. A quarterly dividend of 2 per cent was paid on the old shares on Oct. 15 last.

# Business News and Market Conditions

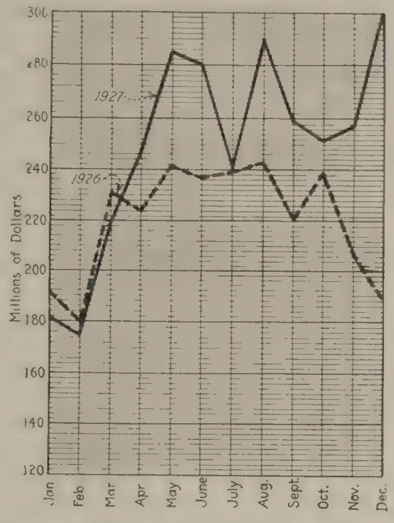
## Engineering Contracts Show Gain in 1927

*Increase of 14 per Cent Over 1926—December a Record Month with Contracts Highest for 1927*

ENGINEERING construction volume for 1927 reached $3,253,766,000, which is $400,000,000 more than in 1926, an increase of 14 per cent, according to the *Engineering News-Record* statistics. December contracts averaged $76,500,000 per week, which is a record. It is $11,000,000 more than the weekly awards last month and $29,000,000 more than December, 1926, average weekly contracts. Several outstanding projects contributing to this large total were a hydro-electric development in Missouri, several pipe lines and two subway contracts, all totaling about $70,000,000. An unusual amount of awards for commercial building in New York totaled $65,700,000.

The construction volume index number for December is 319. This compares with 228 for the whole of 1926 and 100 for 1913. This means that the actual volume of contract letting in December, 1927 (not the mere money value of the contracts let), is 219 per cent greater than the volume for 1913. The index number contains the increment of construction and indicates the rate at which contracts are being let, as compared with 1913 awards. The index number for the average construction volume in 1927 is 262.

Street and road contracts in 1927 show a gain of $40,171,000, or 8 per cent more than 1926, for projects of $25,000 or more. Total awards for this class of construction were $525,069,000, and this is about 16 per cent of all heavy construction awards in 1927, higher than in any preceding year. Since 1913 there has been a consistent gain in street and road contracts, except in 1917 and 1918. The year 1927 was just 100 per cent higher than 1920.



CONTRACTS AWARDED IN THE UNITED STATES

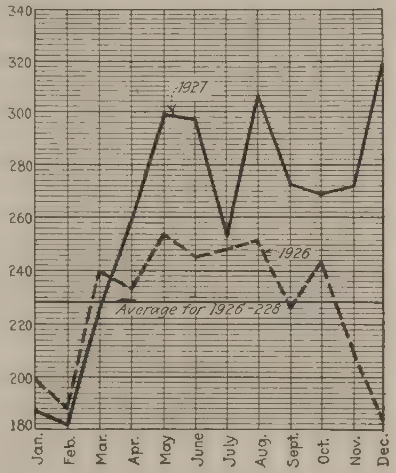
Actual building construction in 1927 was about 6 per cent less than in 1926, and, according to the Architectural Forum, building will continue in 1928 at least in the same volume, if not reaching even greater totals than in 1927.

## Competition Will Be Keen, but Business Active

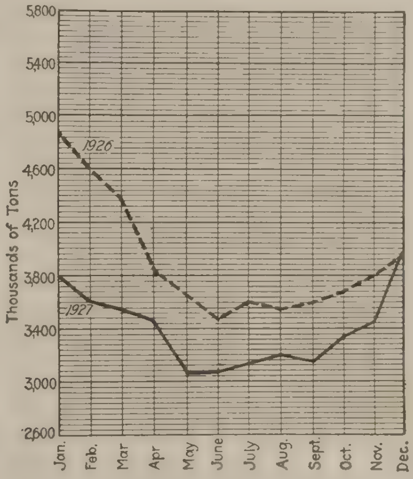
By E. F. LeNoir

*President Union Electric Manufacturing Company*

FOR the coming year competition will be keener, but business will be active and there will be a goodly volume which can be obtained by hard work and keeping on one's toes. The year 1928 will be no worse than 1927. In fact, I look for it to be a little better. The United States is too large and its contact throughout the world is such that we cannot have what every one is so



CONSTRUCTION VOLUME AS COMPARED WITH AN INDEX OF 100 FOR 1913



UNFILLED TONNAGE AS REPORTED BY THE UNITED STATES STEEL CORPORATION

In the chart at the left the actual volume of construction is compared and not the mere money value of contracts let. (*Engineering News-Record* statistics.)

NOTE.—Owing to five weeks of construction contracts being included in some months, as in September, the figure for the total contracts let, as shown in the table, does not agree with the figure as represented in the curve. In order to obtain comparable figures the curve is worked out on a four-week basis for each month.

often afraid of—a slump. Business is on a sound, hard-headed basis, which means hard work and lots of energy, and there is room for all of us to work and to live to make a profit. The only thing I fear is that some of the manufacturers will think it is necessary to reduce prices, but I believe that if the electrical industry increased its prices, it would increase business and naturally, of course, our profits. I certainly hope that the electrical industry will try to uphold prices in every way and eliminate freight allowances, rebates and all of the other extras which a great many are offering today.

# Market Conditions

NEW ENGLAND has no outstanding orders or inquiries to report, and the Eastern district generally is feeling the effect of hand-to-mouth buying, though prospects for early activity are bright. An increase in the inquiries and orders from industrial firms seeking electrical equipment is noted in the Southeast. Good business continues in the central region of the nation, its volume being large for the first of the year. St. Louis, however, reports very few orders of contract size in the district for which it is the marketplace. Small motors are being ordered in considerable quantity in California, and motors and heavy apparatus, including hydro-electric equipment, are in reasonable demand in Seattle.

## *Non-Ferrous Metals Quiet with Easier Prices*

Consumers of non-ferrous metals appear to be waiting for something to turn up, judging from the comparatively small volume of sales during the week ended Wednesday. None of the markets is dead, but the tonnage sold has been below the average. A sharp distinction can be drawn between the position of the important primary producers of copper and the so-called "custom" sellers. Without exception the former have been quoting 14⅛ cents, and that they had the courage of their convictions is proved by the fact that no copper was sold at this price during the week.

NEW YORK METAL MARKET PRICES

| | Jan. 11, 1928 Cents per Pound | Jan. 18, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14.05-14.125 | 14 |
| Lead, Am. S. & R. price | 6⅜ | 6¼ |
| Antimony........... | 10⅞ | 10¾ |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots............ | 6 | 5.95 |
| Tin, Straits........... | 56⅝ | 54¼ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Jan. 11, 1928, 15⅜ cents

Zinc in fair volume was traded in during the week at 5.62½ cents. A few sales for May-June delivery brought 5.65 cents. The lead market was disrupted in the week, with offerings on Wednesday by a Middle Western dealer at 6¼ cents, St. Louis, five points less than that which any producer had theretofore been willing to accept for this metal.

## *Small Sales Prevail in Eastern District*

Curtailed orders rule in the Eastern district, and virtually every branch of the electrical industry is feeling the effects of a sluggish market brought about by hand-to-mouth buying. Prospects, however, are bright; sizable business appears ahead and is imparting a firm tone to the general situation. Inquiries are increasing both in volume and proportions as compared with the first two weeks of the month, but while a fair percentage is directed to central-station account, there are few immediate commitments in sight for heavy generating machinery or affiliated equipment. Substation and line equipment are developing an encouraging advance status in the New York market, and a leading manufacturer says that indications are that January sales will closely parallel those of the same month last year. About 93 per cent of current account, it is stated, is for outdoor-type apparatus. There is a fair movement in control equipment, according to a large producer, and the past few days are showing decided betterment. While the majority of present sales is for small account, the sum total is close to normal, approximately 50 per cent of current business being from prominent baking interests. A new cement mill in the St. Louis district is expected to place a large order for control equipment at an early date, and other important industrial projects are also maturing.

The Philadelphia market is operating under restricted buying, and industrial account is developing the majority of commitments. There is a fair demand for motors of medium capacity, with smaller units showing a tendency to lag. The business in wire and wiring materials is spotty and orders are light.

Construction activities in the Eastern district include the following: The Department of Mental Hygiene, Albany, N. Y., is asking bids until Jan. 25 for a cold-storage plant at the state hospital at Binghamton, including complete electrical work. The Mohawk-Hudson Power Corporation has acquired the Schodack Light & Power Corporation, operating at Castleton, N. Y., and vicinity, and plans line and other expansion in that district. The United Electric Light & Power Company, New York, has acquired an entire block of property on the Harlem River, adjoining its power plant at 201st and Academy Streets, for future expansion. The Pennsylvania Railroad Company, Philadelphia, is arranging the early construction of a cold-storage and refrigerating plant on Oregon Street, reported to cost in excess of $150,000, with equipment. Day & Zimmermann, Inc., Philadelphia, engineers, are taking bids until Jan. 31 for electric work, refrigeration, etc., for a cantonment and utilities at Graterford, Pa., for the Eastern State Penitentiary. The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., is asking bids until Jan. 24, for electric wiring devices (Schedule 8320), electric heaters (Schedule 8321) and insulation material (Schedule 8324.)

## *New England Trend Uneven with No Outstanding Orders*

Little change during the past week as compared with the previous week is recorded for this district. No outstanding orders were reported, although sales are progressing and interest is quite marked along special lines. Industrial electric heating manufacturers are busy and report increasing interest; a number of heating furnace orders will be closed shortly. Industrial electric lighting is active, and present layouts reported by one prominent central-station group are far over the number last year. Line extensions are being planned for southeastern Massachusetts. Quotations for materials for service expansion are gaining.

Central-station supplies are less active, small-motor sales are steady, and industrial equipment is quiet. One manufacturer reports an inquiry for loom motors for individual drives; another records an encouraging trend toward sales among machine-tool manufacturers. Electric range sales are promising, and oil-burning equipment installations show a marked gain over last year for the past month.

Projects in view in this district are confined to hospital and institutional expansion. The Stone & Webster Corporation announces plans for the expansion of its southern Texas properties at a cost of $3,000,000.

## *Good Spring Trade Expected in St. Louis District*

Very little business of contract magnitude is reported from the St. Louis district. Sales of stock sizes in motors and transformers for general purposes have been better than last week. A decrease was shown in the shipment of building materials and line-construction hardware. Several central-station jobs are being figured on, and the feeling reflected by manufacturers is that spring business will be good.

Construction projects reported are as follows: New Orleans is considering an ornamental lighting system in the business district. The Canadian Ice Company plans an ice-manufacturing plant on Gentilly Street, New Orleans, to cost about $100,000. St. Louis is arranging an appropriation of $200,000 for improved lighting systems on a number of streets. The Southwestern Light & Power Company, Oklahoma City, will build a transmission line from Clinton to Arapaho, Okla. The Oklahoma Gas & Electric Company, Oklahoma City, plans an additional generating unit at its Horseshoe Lake power plant and will also enlarge the substation on Broadway, Oklahoma City. The Texas Power & Light Company, Dallas, plans extending its transmission system to Briggs, Tex., and vicinity. Fort Worth plans an ornamental lighting system on Magnolia Avenue and Camp Bowie Boulevard. The West Texas Utilities Company, Abilene, Tex., has authorized the immediate construction of a power plant at Lake Pauline, near Quanah, Tex., to cost about $1,500,000. The Gulf Public Service Company, Jacksonville, Tex., is considering a transmission line from Jacksonville to Troup, Tex. The Central Power & Light Company, San Antonio, plans extensions in the ice plant at Victoria, Tex., to increase capacity to 120 tons, to cost about $80,000.

### *Industrial Business Picking Up in Southeast*

Activities in the electrical field in the Southeast continue quiet, though there is an increase in the number of inquiries and orders from industrial firms. Central-station companies are marking time and placing only a reasonable volume of orders. The largest central-station order reported last week was for high-tension line-construction materials amounting to about $8,000. Other line-construction material orders included one for wire and cable totaling $2,274 and creosoted pine poles amounting to $2,100. House-type meters continued in reasonably steady demand, one company ordering $1,000 worth of this metering equipment last week. Another power company order called for switching equipment totaling $1,500. A textile electrification project in Georgia was reflected last week in orders for motors amounting to $4,700, wiring materials costing $4,100 and three 250-kva. transformers. Another textile mill in that state ordered $3,000 worth of inside wiring materials. A brick plant in the same state ordered one 333-kva. transformer and contemplates the immediate purchase of three 100-kva. transformers. The latter equipment may be ordered during the coming week. Purchases by contractors are generally small, though the larger contractors are buying a little better than the smaller. One contractor ordered this week $1,500 worth of conduit in one order.

Construction projects are as follows: The United Public Service Company, Chicago, plans extensions and improvements in the ice-manufacturing plants at Mobile, Ala., to cost about $100,000. The River Falls Power Company, River Falls, Ala., contemplates the construction of a power plant at River Falls, Ala., to cost about $150,000. The Southeast Georgia Power Company, Alma, Ga., will make extensions and improvements in its local power plant. Kingan & Company, Indianapolis, plan a cold storage and refrigerating plant on Peters Street, Atlanta, to cost about $100,000. The Mississippi Power & Light Company, Pine Bluff, Ark., plans a transmission line to Hazelhurst, Miss., and vicinity. The Tennessee Electric Power Company, Chattanooga, Tenn., plans an expansion and improvement program in 1928, to cost about $5,000,000, including power-plant and transmission-line extensions. Clarksville, Tenn., is considering an ornamental lighting system in the business district. The Union Carbide & Carbon Corporation, New York, plans an expansion program at plants in vicinity of South Charleston, W. Va., to cost about $4,000,000.

### *Motor Sales Are a Factor on Pacific Coast*

The week, according to one California manufacturer, has been distinguished by its orders for small motors, such as a $10,000 assortment of motors and parts for an oil-burner company, 275 1/20-hp. motors, valued at $3,500, for calculating machines, and 100 ¼-hp. motors and washing machines. The outstanding order of the week covered a 500-kw. rotary converter complete with transformer switchboard and accessories, total value $45,000, for a chemical company. Other wattmeter orders include 250 of residence type, value $3,000, for stock and installation in the Bay region and 220 watt-hour meters, also ten assorted transformers, sizes 15 kva. and 25 kva., for the Hawaiian Islands. The city of Seattle opened bids on valves and gates for the Diablo Dam, the low bidders being: Hendy, $12,798 for three butterfly valves, size 78 in.; Pelton, $24,980 for a 72-in. Johnson valve; Phillips & Davies, $120,000 for six caterpillar gates. The El Camino Irrigation District of Tehama County is requesting bids for six deep-well pumping plants complete. Alameda County has purchased $70,000 worth of Sturtevant ventilating equipment and motors, costing $14,000, for the Oakland estuary tube.

Sales of motors and heavier apparatus made last week in Seattle include about $135,000 for a 72-in. Johnson valve and for three caterpillar gates, one 8 ft x 10 ft. and two 15 ft. x 20 ft., for the Diablo Dam of the Skagit project of the city of Seattle; two switchboards, costing $15,000 each, for pulp and paper mills for the Zellerbach interests at Port Townsend and Hoquiam; 25 motors, from 50 hp. down, supplementing a former order for a hemlock mill in Tacoma; a 200-hp. motor and 10-in. pump to a sand and gravel company, and about 75 motors from 50 hp. down by several jobbers to dealers and to lumber mills for replacements. Pole-line distributors report one or more inquiries of consequence from a central-station company for poles and equipment for proposed transmission line, stating that sales are very light with indications for improvement fair. The city of Seattle within sixty days will buy about $20,000 worth of distributing transformers of from 250 kw. and down and $20,000 worth of weatherproof wire for local distribution.

Construction projects are as follows: The Texas-Louisiana Power Company, Fort Worth, plans a power plant and an ice plant at Duncan, Ariz., to cost about $125,000. Alhambra, Calif., is asking bids until Feb. 6 for the installation of an ornamental lighting system on a number of streets. Los Angeles has authorized an ornamental lighting system on Hillcrest Road, using pressed-steel standards. Los Banos, Calif., has plans maturing for an ornamental lighting system in the business district. Madera, Calif., has authorized an ornamental lighting system on F Street. Monrovia, Calif., has authorized an ornamental lighting system on a number of streets, using concrete standards. Riverside, Calif., has authorized an ornamental lighting system on Palm Avenue, Del Ray Court and other thoroughfares. Torrance, Calif., is completing plans for an ornamental lighting system on a number of streets in the business district. The Santa Ana County Supervisors have authorized plans for an improved lighting system on highways near Westminster, Calif., to cost $21,000. Caldwell, Idaho, plans an ornamental lighting system in the business district. Butte, Mont., is considering an ornamental lighting system on East Park Street. The Great Northern Utilities Company, Shelby, Mont., is considering an ice plant, to cost about $70,000. Albuquerque, N. M., has plans for an ornamental lighting system on South Second Street and West Copper Avenue. The Cascade Power Company, Brevard, N. C., has applied for permission for a hydro-electric power development on the Wenatchee River, near Wenatchee, Wash., to cost about $350,000. The Priest Rapids Ice & Cold Storage Company, White Bluff, Wash., plans a cold-storage and refrigerating plant.

### *Middle West Reports Excellent Business*

Good business has continued in the Middle West section this week. Its volume is appreciably large for the first part of the year, and indications are that it will continue. Industrial activity is noticeably good, building activity is getting under way nicely, and the railroads are coming into the market for equipment. Utility companies are figuring on large quantities of cable, and considerable purchasing of apparatus is going on, the sales including nine 20,000-kva. oil-insulated self-, water- and forced-oil-cooled, single-phase, 60-cycle power transformers; fifteen 2,222-kva. regulating transformers, one 150-kv. neutral kenotron cable-testing set, smoke uptakes and air ducts for three boilers complete with appurtenances, and meter-control equipment for three boilers complete with appurtenances. Cable manufacturers report an increase in the number of inquiries received, and pole-line hardware manufacturers are busy. Prices remain generally firm. Owing to a price war on lock nuts, bushings and outlet boxes, the established prices were cut considerably.

Current construction includes the following: Elgin, Ill., plans an ornamental lighting system on North Street, from Spring to Douglas Avenues. The Interstate Public Service Company, Goshen, Ind., has purchased the Midway Electric Company, Shipshewana, Ind., and plans extensions in transmission lines in that district. The Iowa Railway & Light Corporation, Cedar Rapids, Iowa, will build a transmission line from Gilbert to Story City, Iowa. Fordson, Mich., plans a municipal power plant. The Michigan Electric Power Company, Bad Axe, Mich., is arranging an expansion and improvement program in the "Thumb" district, to cost about $500,000, including transmission-line extensions. The Neligh Electric Light Company, Neligh, Neb., has approved plans for the construction of a power plant on Main Street, to cost $100,000. The Montana-Dakota Power Company, Minneapolis, is negotiating for the purchase of the distributing system at Williston, N. D., and plans extensions in the transmission lines. The Northern Ohio Produce Company, Cleveland, plans an ice and cold-storage plant on Woodland Avenue, to cost about $3,000,000. Elyria, Ohio, will build a power plant in connection with the proposed sewage-disposal system, to cost about $850,000. North Milwaukee, Wis., plans an ornamental lighting system on Villard Avenue. Stoughton, Wis., plans extensions and improvements in the municipal power plant. The National Ice & Coal Company, West Allis, Wis., has superstructure under way for an ice plant to cost in excess of $60,000.

# Activities of the Trade

## Changes in Allis-Chalmers Manufacturing Company

The Allis-Chalmers Manufacturing Company, Milwaukee, has opened a new district sales office at Phoenix, Ariz., covering Arizona, New Mexico and the northern part of Mexico. The office is at 308 Heard Building, with J. B. Cooper as manager. Mr. Cooper's headquarters were formerly in Los Angeles. A branch of the district office at Dallas has been opened at San Antonio, 619 Frost National Bank Building, with Earle R. Hury in charge. A branch of the Detroit district office is being opened at Grand Rapids, Mich., in the Weiss Service Building, with G. C. Culver in charge.

## Cutler-Hammer Company Opens Pacific Coast Offices

Since Jan. 1, 1928, the Pacific Coast offices of the Cutler-Hammer Manufacturing Company, Milwaukee, manufacturer of electric motor-control apparatus and allied lines, have been handled by its own sales organization at 970 Folsom Street, San Francisco; 229 Boyd Street, Los Angeles, and 2203 First Avenue, South, Seattle. The new sales district will be in charge of Fred H. Oberschmidt, a member of the Cutler-Hammer organization for more than fifteen years. Associated with Mr. Oberschmidt at the San Francisco headquarters office will be A. A. Tuffert and George P. Stone. Thomas N. Bristow will be in charge of the Seattle office and Edward G. Nelson of the Los Angeles office.

Complete stocks of standard items in the Cutler-Hammer line will be carried at all Pacific Coast offices. The company states that special arrangements have been completed whereby production and shipment of special equipment for the Coast, built in the Cutler-Hammer factories at Milwaukee and New York, will be given preferred attention. This is the second new sales district to be opened by the company within a short period. An office at Atlanta was recently established.

## National Carbon Company, Opens Branch Offices

The carbon sales division of the National Carbon Company, Inc., with general sales headquarters at Cleveland, has announced the opening on Jan. 3, 1928, of branch sales offices at the present brush service plants of the company in New York City, Chicago, Pittsburgh and Birmingham. The addresses of the newly established offices are as follows: 357 West Thirty-sixth Street, New York; 551 West Monroe Street, Chicago; Arrott Power Building, Barker Place, Pittsburgh, and 1824 Ninth Avenue, North, Birmingham. Complete sales and service organizations have been established at each office, and the customers of the company have been requested to address all orders and inquiries for carbon brushes and the other carbon specialties to the nearest branch sales office.

E. A. Williford, manager of the carbon sales division at Cleveland, announces the following appointments: J. A. Hammond, assistant manager in charge of carbon brush and specialty sales (Mr. Hammond will be at the headquarters office at Cleveland); E. R. Geib, assistant manager in charge of sales of illuminating carbons (Mr. Geib also will be at the headquarters in Cleveland); E. C. Friday, district manager in charge of the branch office at New York City; J. L. Green, district manager in charge of the branch office at Chicago; V. J. Nolan, district manager in charge of the branch office at Pittsburgh, and J. B. Collins, sales engineer in charge of the branch office at Birmingham.

The Gold Seal Electric Company, 250 Park Avenue, New York City, manufacturer of radio tubes, announces that it has taken over the business of the Gold Seal Electric Company of Cleveland, manufacturer of household electrical appliances. The company states that factories will be maintained in Cleveland, Ohio, and Newark, N. J., with executive sales offices at New York City.

The Chas. L. Ward Company, manufacturers' agent, 701 Midland Building, 1229 Baltimore Avenue, Kansas City, Mo., has added Western red cedar poles to its line, and has concluded an arrangement with B. J. Carney & Company, Minneapolis, to cover the states of Missouri, Kansas, Nebraska, Oklahoma, Arkansas and Texas.

The Rollway Bearing Company, Inc., Syracuse, N. Y., announces the opening of a Pittsburgh sales office at 614 Empire Building, Pittsburgh, in charge of Samuel Farrell, who for a number of years was in charge of the Youngstown (Ohio) office of the company.

The Edison Electric Appliance Company, Inc., 5600 West Taylor Street, Chicago, has recently added to its line of "Hotpoint" ranges the RA77 de luxe automatic electric range, the R102 and the R103 apartment-house models and the H52 kitchen heater furnished as an attachment to the R73, R74 and R77 ranges.

The Graybar Electric Company, Graybar Building, New York City, announces the following changes in its organization: J. F. Davis was appointed manager at Boston; A. R. Loughborough, manager at Pittsburgh; H. W. Dye, service and credit manager at Denver, replacing J. Hageman, who has been transferred to St. Louis; Louis Fiille has been elected secretary, and Martin Wagner, assistant secretary.

The Railway & Industrial Engineering Company, Greensburg, Pa., announces that E. L. Flowers, formerly in the New York office, has been transferred to the Boston office as district manager, superseding Patrick O'Moore, who has resigned.

The Black & Decker Manufacturing Company, Towson, Md., manufacturer of portable electric tools, has acquired the Van Dorn Electric Tool Company, of Cleveland, Ohio.

John G. Oliver, formerly connected with the Greensboro district of the Georgia Power Company, has been transferred to Gainesville in the same capacity.

# New Equipment Available

## Switch House Designed for Maximum Accessibility

A sheet-steel weatherproof switch house equipped with roof bushings for direct connection to disconnecting switches and overhead bus structures, with space for different-sized circuit breakers, potential transformers and secondary control and metering equipment, has been placed on the market by the Condit Electrical Manufacturing Corporation, Boston. No twists are necessary in the connections within the house or in those leaving it. All apparatus is easily accessible. Circuit-breaker tanks are readily removed through the rear doors. The front and rear of the control and metering panel are conveniently reached, facilitating the testing of connections, meters and relays. All auxiliary wiring is in conduit and test terminals are provided.

Automatic reclosing service can be furnished with either alternating-current or direct-current supply, the service being of one or more closing cycles with constant or varying time delay. Protruding channel-iron sills drilled for anchor bolts facilitate lifting and handling. The switch house is constructed of sheet-steel plates electrically welded, and the roof overlaps the four walls, affording a weatherproof construction.

## Single-Operator Welder

A single-operator welder rated at 300 amp., one hour, 50 deg. C. temperature rise, is announced by the General Electric Company as the latest addition to its standard line of welding equipment. This machine includes a four-bearing, ball-bearing motor-generator set with flexible coupling. With this equipment the manufacturers claim a rapid and simple interchange of motors may be made by the user. The generator is so designed that field control is unnecessary and is eliminated. The generator panel includes an ammeter and a voltmeter which have a metal front except for the glass over the scale, thus minimizing the possibility of breakage.

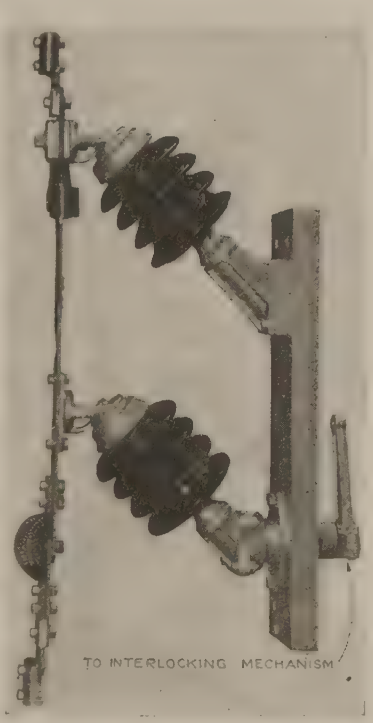
Belt, motor or engine drive may be used with the generator, which is designed for either stationary or portable use. The unit can be used as both a manufacturing and a repair tool.

## General-Purpose Motor

A starterless general-purpose squirrel-cage motor has been placed on the market by the Star Electric Motor Company, Newark, N. J. The new motor is said to be similar in every way to the standard single squirrel-cage general-purpose motor and retains all of the desirable features of that type. The unit is made in sizes up to 30 hp., and has synchronous speeds of 900, 1,200 and 1,800 r.p.m. for general industrial application. The starting current inrush is said to be within the National Electric Light Association requirements, without impairment of efficiency and power factor. Like all Star motors, this line is equipped with large ball bearings which offer long-life characteristics with low frictional losses.

## Outdoor Gang-Operated Disconnecting Switch

A gang-operated outdoor disconnecting switch, which is particularly applicable for installations where extra insulation is required, such as in substations located near the seacoast where salt air and fog tend to reduce the insulator flashover, has been developed by the Delta-Star Electric Company, Chicago. The switch illustrated is equipped with fog-type insulators having a very large leakage surface. The insulator units are of the same height and interchange with the standard petticoat "unit-type" insulators used for equipment of the same voltage rating.



GANG-OPERATED OUTDOOR DISCONNECTING SWITCH WITH FOG-TYPE INSULATOR

This switch is of the side-break type, requires but two insulators per pole and is furnished with double self-aligning full-floating contacts. The base dimensions are the same as the base dimensions of single pole-hook-stick-operated switches, thus making the change to this gang-operated switch a simple matter.

## Network Protector

The type CM-2 network protector, placed on the market by the Westinghouse Electric & Manufacturing Company, is said by the company to represent in several respects, a radical departure from existing standards in design and arrangement of network protector equipment.

The CM-2 protector includes, as standard equipment, a three-element polyphase relay, a single-phase phasing relay, a silver-faced contactor-type main circuit breaker isolated by liberal barriers, and an operating mechanism, which may be either motor- or solenoid-closing and can be equipped with either a 24-volt shunt trip or a 20 per cent drop-out undervoltage release trip. All control wiring and relays are mounted on a separate-hinged steel panel which may be swung out to give free access to the main panel. All control wiring is held in place by cleats on the back of the relay panel, thus making it simple to trace out circuits. The relays are mechanically held in place on the steel panel by the same screws that make the electrical connections to them. Any internal relay circuit may, therefore, be tested by removing the proper screws. The new scheme of control wiring in conjunction with the three-element high-torque polyphase relay and the phasing relay have provided positive assurance against any type of pumping, regardless of system conditions or primary voltage now known. The control circuits may be "killed" without disturbing the main unit by opening a two-pole knife switch and removing two-clip-type fuses which have been provided for protection of this equipment.

The new protectors are available in 800-amp. and 1,200-amp. sizes, both subway and open type, and later a 2,000-amp. protector also will be marketed. No major changes have been made in the 250-amp. and 500-amp. units, except the addition of the polyphase and phasing relays and the disconnecting features which permit isolating the unit from the system. In general, the basic features claimed by the company for the design of the new type CM-2 protector are improved operating characteristics, a minimum number of parts, accessibility, ease of maintenance, compactness, light weight and fool-proof operation.

SMALL TURBO-GENERATOR UNIT.—A direct-connected turbo-generator unit having a rating of 3 kw. has been recently placed on the market by the Westinghouse Electric & Manufacturing Company. This apparatus has been developed to meet the demand for a high-grade small non-condensing steam-turbo-generator lighting set for use with oil-well rigs, steam shovels, isolated pumping plants and for general outdoor construction work. The generator coils are specially impregnated, and all parts requiring such protection are heavily sherardized to meet conditions of applications such as marine service.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Dec. 24, 1927)

1,653,947. Electrically Controlled Indicating Instrument; H. L. Decker, Toledo, O. App. filed Aug. 23, 1926.

1,653,951. High-Frequency Coil; E. B. Featherstone, Toledo, O. App. filed Nov. 13, 1922.

1,653,961. Electricity Meter; F. Holden, Hampstead, London, England. App. filed April 22, 1926. In which a conducting bell or armature rotates in a body of mercury while being acted upon by a magnetic field.

1,653,999. Battery Connection; W. E. Goodwin, Cedar Bluff, Va. App. filed Sept. 21, 1926.

1,654,038. Lining for Dry Cells; C. P. Feibel, Lakewood, O. App. filed Dec. 15, 1924.

1,654,046. Process for the Production of Arc Light Electrodes; L. Kahl, Berlin-Dahlem, Germany. App. filed May 31, 1923

1,654,047. Strain Insulator; J. S. Lapp, Le Roy, N. Y. App. filed May 10, 1922.

1,654,085. Voltage Limiting Device; G. T. Lorance, New York, N. Y. App. filed Oct. 21, 1925. For limiting the voltage applied to a specific part of a transmission system.

1,654,097. Alternating Current Supply Means; W. J. Shackelton, Scotch Plains, N. J. App. filed Oct. 8, 1923. To reduce fluctuations in the voltage across the terminals of the secondary winding of a transformer when a variable voltage is impressed upon the primary winding.

1,654,139. Open Electric Furnace; P.L.J. Miguet, St.-Julien-De-Maurienne, France. App. filed Sept. 29, 1926.

1,654,143. Electric Terminal; T. C. Russell, Chicago, Ill. App. filed July 23, 1926. Adaptable in electrical heating devices, such as flatirons.

1,654,150. Illuminating Appliance; W. W. Thompson, Dorchester, Mass. App. filed July 16, 1923. For use in the sick room of a hospital.

1,654,162. Lighting Fixture; L. C. Doane, Meriden, Conn. App. filed Sept. 17, 1924.

1,654,177. Self-Centering Core for Dry Batteries; H. M. Koretzky, Hoboken, N. J. App. filed Dec. 31, 1924.

1,654,212. Insulator for High Tension Electric Current; W. Deutsch, Frankfort-on-the-Main, Germany. App. filed Feb. 4, 1924.

1,654,227. Dry Cell; H. Vignon, Paris, France. App. filed Nov. 4, 1925.

1,654,254. Connecter for Electrical Conductors; W. F. Hendry, Ossining, N. Y. App. filed Jan. 7, 1924. For use with push-button switches or the like and as a connecting clip or binding post.

1,654,273. Electric Hair Drier; W. G. Shelton, New York, N. Y. App. filed Oct. 4, 1924.

1,654,282. System of Control; R. E. de Camp, Wilkinsburg, Pa. App. filed Nov. 20, 1919. For controlling the sequence of operation of a plurality of electromagnetic switches for controlling the operating circuits of dynamo-electric machines.

1,654,292. Electric Heating Unit; A. D. Keene, Pittsburgh, and K. Ehrgott, East Pittsburgh, Pa. App. filed Feb. 10, 1925, for electric ranges.

1,654,302. Control Apparatus; H. R. Meyer, Wilkinsburg, Pa. App. filed July 15, 1920. For electric railway vehicles.

1,654,303. Automatic Transformer Switching System; C. McL. Moss, Pittsburgh, Pa. App. filed March 23, 1922.

1,654,305. Ventilation of Dynamo Electric Machines; S. G. Nottage, Murraysville, Pa. App. filed Aug. 6, 1925.

1,654,306. Laminated Core; P. Paszkowski, Irvington, N. J. App. filed Jan. 22, 1925.

1,654,308. Electrical Measuring Instrument; R. T. Pierce, East Pittsburgh, Pa. App. filed May 12, 1923. Alternating-current ammeter or voltmeter mechanism.

1,654,309. Circuit Interrupter; K. C. Randall, Edgewood Park, Pa. App. filed April 18, 1922. Governed by conditions in the circuit which it is desired to control.

1,654,315. Quick-Acting Thermal Relay; R. J. Wensley, Edgewood, Pa. App. filed April 6, 1923.

1,654,316. Circuit Interrupter System; W. R. Wickerham, Pittsburgh, Pa. App. filed Oct. 5, 1923. For use on systems of electrical distribution adapted to supply energy from a common distributing circuit to a plurality of feeder circuits.

1,654,317. Voltage Balancing Regulator; J. H. Ashbaugh, Pittsburgh, Pa. App. filed Jan. 2, 1926.

1,654,338. Supporting Means for Electrical Conductors; A. M. MacFarland, Wilkinsburg, Pa. App. filed Dec. 29, 1923. Embodied in resistance units and electric heaters.

1,654,350. Block Letter Sign; W. G. Shelton, New York, N. Y. App. filed Nov. 7, 1924.

1,654,360. Regulator System; J. H. Ashbaugh, Wilkinsburg, Pa. App. filed Oct. 4, 1924. Incorporating a short-circuit protective device.

1,654,373. Electrical Switch Mechanism; F. A. Holt, Elmhurst, N. Y. App. filed June 2, 1923. For use as a circuit controller in flashlights or the like.

1,654,382. Metallic Arc-Welding Apparatus; F. C. Owen, Fayetteville, N. C. App. filed Feb. 12, 1925.

1,654,394. Liquid Rheostat; C. C. Whittaker and D. C. West, Pittsburgh, Pa. App. filed Nov. 5, 1923.

1,654,419. Electric Furnace; A. E. Greene, Medina, Wash. App. filed Nov. 23, 1922.

1,654,467. Explosive Blow-Out Switch; J. P. Medlin, Great Falls, Mont. App. filed Nov. 25, 1925.

1,654,475. Connecter Device; C. W. Wyman, Claremont, N. H. App. filed April 8, 1922. For use in coal mining for the purpose of making running and fixed contact with the trolley wires employed in the entries of such mines.

1,654,483. Circuit Controller; J. M. Johnson, Kansas City, Mo. App. filed Oct. 17, 1921.

1,654,505. Automatic Station; S. G. Leonard, Lakewood, O. App. filed Dec. 29, 1925.

1,654,508. Flexible Cable; C. R. Boggs, Waban, Mass. App. filed Feb. 11, 1926.

1,654,511. Electrical Interlocking Mechanism; D. L. Galusha, Bronxville, N. Y. App. filed April 3, 1924.

1,654,518. Centrifugal Mechanism for Electric Switches and Other Apparatus; L. S. Walle, Scotia, N. Y. App. filed June 8, 1922.

(Issued Jan. 3, 1928)

1,654,521. Safety Toggle-Break Switch; E. E. Anderson, Chicago, Ill. App. filed Jan. 12, 1925. High-tension switch with a distant control.

1,654,523. Refrigerator Control Mechanism; W. E. Bihl, Chicago, Ill. App. filed June 8, 1923.

1,654,534. Electrical Insulator; E. A. Dean, Oak Park, Ill. App. filed Sept. 28, 1923. High voltage.

1,654,546. Electric Cable; F. S. Malm, Chicago, Ill. App. filed April 6, 1923. Submarine cable.

1,654,551. Fluid-Heating Device; K. Muhleisen, Philadelphia, Pa. App. filed Dec. 20, 1924.

1,654,562. Electric Flash Welding or Heating Machine; A. C. Taylor, Warren, Ohio. App. filed Oct. 3, 1923.

# New Trade Literature

POWER FOR IRRIGATION.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a special publication No. 1786, entitled "The Modern Power for Irrigation," which gives information necessary to estimate and install electrically driven pumps in any conditions encountered in irrigation projects, as well as the various phase of irrigation.

SWITCHING AND PROTECTIVE EQUIPMENT.—Bulletins GEA-570A, GEA-572, GEA-545B, GEA-841 and GEA-880 issued by the General Electric Company, Schenectady, N. Y., describe and illustrate respectively its hand-starting compensators for squirrel-cage induction motors, automatic switching equipment for synchronous converters in mining service, automatic supervisory, selector-type equipment for control and indication of remote power apparatus, its CR7006-D 26 magnetic switch and CR4409 protective panels for providing overload and undervoltage protection for direct-current crane motors.

MOTORS AND GENERATORS.—Bulletins GEA-61A, GEA-63A, GEA-529A, GEA-858 and GEA-873 issued by the General Electric Company, Schenectady, N. Y., describe and illustrate type CD constant-speed direct-current motors from 3 hp. to 200 hp., type GTE motors for gearless traction elevators, low-speed synchronous motors for direct connection to reciprocating compressors, low-speed direct-current commutating pole generators for direct connection to steam or internal-combustion engines and the improved brush holders for GE-70 and GE-80 railway motors.

BAFFLE WALL.—The Boiler Engineering Company, 931 Federal Trust Building, Newark, N. J., has issued a bulletin describing the "Beco" baffle wall. Drawings as well as photographs of typical installations are included.

LIGHTING UNITS, TRAFFIC SIGNALS AND AIRPORT LIGHTS.—The General Electric Company, Schenectady, N. Y., is distributing bulletins GEA-373A, GEA-313A, GEA-740A, GEA-742A and GEA-906, covering the "Novalux" ornamental units, forms 8 and 9; "Novalux" electric traffic signals, "Novalux" traffic signal control apparatus, and airport boundary lights, respectively.

STEELPLATE BLOWER.—Bulletin No. 3504 issued by the American Blower Corporation, Detroit, describes and illustrates the type SE steelplate blower. This bulletin supersedes bulletin No. 2004.

GROUND-RESISTANCE TESTER.—Bulletin No. 1165 issued by James G. Biddle, 1211 Arch Street, Philadelphia, covers the "megger" ground-resistance tester for testing the resistance to earth of all types of ground connections. A diagram of connections is included, and complete directions for the operation of the instrument are given.

CUT-OUTS.—The General Electric Company, Schenectady, N. Y., is distributing bulletin GEA-732A, describing and illustrating the "D & W" oil-fuse cut-outs, type D.

SCREWS, BOLTS, RIVETS AND NUTS.—A catalog issued by the Pheoll Manufacturing Company, 5700 Roosevelt Road, Chicago, describes and illustrates its screws, bolts, rivets and nuts. This catalog contains reference tables, including the "American Standard Screw Threads" and the recently adopted standard dimensions and tolerances for screws, bolts, rivets and nuts.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase or agency is desired in Cairo, Egypt (No. 29,004), for electrical appliances, bells, switches, sockets, and general supplies.

An agency is desired in Cairo, Egypt (No. 29,005), for electrical appliances, plain and colored insulated wire, switches, sockets, shades, etc.

An agency is desired in Berlin, Germany (No. 29,006), for electrochemical specialties.

Purchase and agency are desired in Milan, Italy (No. 29,003), for electric hair-cutting machines.

An agency is desired in Auckland, New Zealand (No. 29,008), for electric household appliances.

An agency is desired in Hamburg, Germany (No. 29,079), for electric household appliances.

Purchase and agency are desired in Hanover, Germany (No. 29,002), for message-transmitting devices for hotels and electric laboratory stoves.

An agency is desired in Quebec, Canada (No. 29,001), for small electric household refrigerators.

An agency is desired in Milan, Italy (No. 29,044), for trolley wire.

Direktionsrat Deck, Elektrizitaetswerke in Wien, Mariannengasse 4, Vienne IX, is desirous of obtaining catalogs of various electrical household appliances including electric cooking devices.

The city of Riga, Latvia, plans a new power plant about the latter part of 1929 at Kremershof across the river Duna from Riga.

The city of Sherbrooke, Quebec, Canada, will construct a dam and a power house at Westbury, Quebec.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

## Possibilities of Increase in Residential Energy Sales

ANALYSIS of operating statistics for 1926 of 70 systems in various parts of the United States, all but a few of them having more than 30,000 residential customers, shows a range of nearly six to one in the average annual energy consumption per residential customer. The smallest is 231 kw.-hr., the largest is 1,290. Regional averages fall between 335 and 455 kw.-hr. per residential customer, with the exception of the Mountain states, where the unusually high consumption reported by one large company materially raises the average. The weighted average for all the companies is about 400 kw.-hr. The national average for the entire electric light and power industry, taking into account the numerous small properties, is probably somewhat lower and seems to justify the generalization that the average residential customer in the United States takes about 1 kw.-hr. a day.

The highest sales per customer are in the West. Low long-hour rates possible with water power, combined with other favorable local conditions, probably go far to account for that condition. If small operations could be included the showing might not be so good.

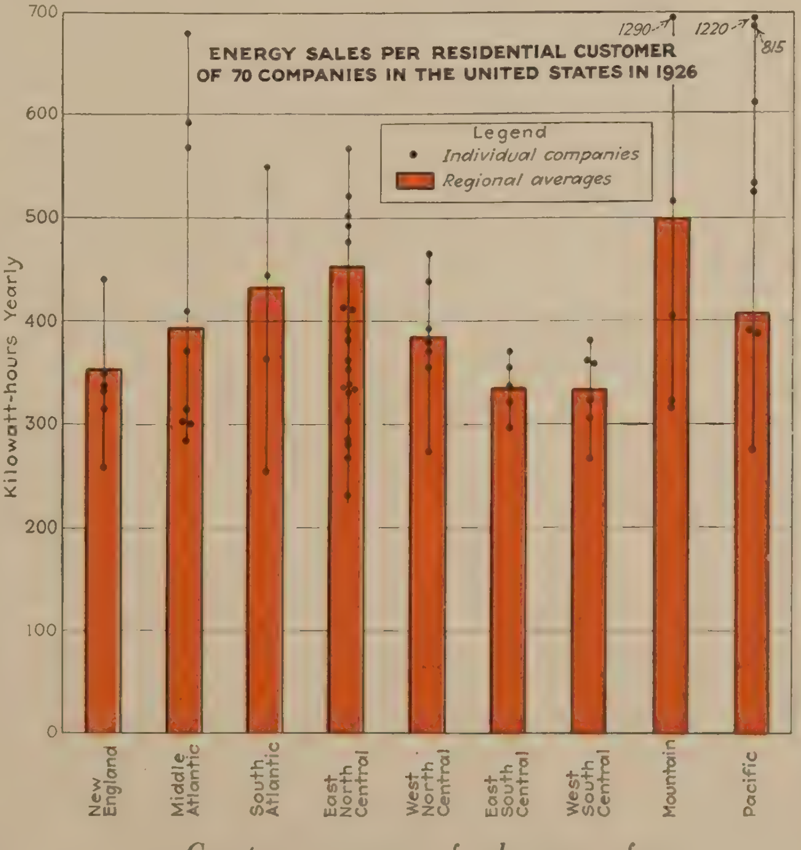
The comparison between companies suggested by such a chart as the one here presented is not entirely fair. Its chief weakness lies in the lack of a universally accepted and accurate definition of "customer" or "consumer," hence the figures reported under this heading by different companies do not necessarily all mean the same thing. For that reason companies have not been designated. But in a national sense it makes little difference if some of the points are moved up or down, even so much as 5 per cent. The variation in the basis on which the returns may be made can scarcely amount to more than that. Another small change would be made by using the average number of customers rather than the number at the end of the year, if the former had been available.

The high results attained by some companies cannot be expected in all cases. Conditions differ. But as growth by the acquisition of new customers proceeds more and more slowly, greater attention is necessary to the problem of increasing consumption by those already on the lines. The advantages of electric service are well known; there is no lack of desire on the part of the public to avail itself of them. Long-hour use of electricity is of advantage to both buyer and seller.

But where this is not recognized and encouraged, the consumer is virtually subjected to a handicap against using those load builders that are competitive with non-electrical devices. If greater residential energy consumption is desired, and that generally means a more liberal use of oil-burners, ranges, refrigerators, and other off-peak devices, it must be conscientiously fostered by salesmanship and, in particular, by suitable rate structures.

---

Most of the data for statistics in the ELECTRICAL WORLD are gathered by it from original sources. Privilege is freely given to readers of the ELECTRICAL WORLD to quote or use these statistics for any legitimate purpose. While there is no requirement that the source of data be given, yet it would help the ELECTRICAL WORLD in obtaining and compiling further basic information if those who make use of these statistics would give credit to the ELECTRICAL WORLD.



*Company averages of sales range from 231 to 1,290 kw.-hr. per year*

# 1927 Industrial Operations in the Middle Atlantic States Were 0.7 Per Cent Under 1926

REPORTS on the consumption of electrical energy by the manufacturing plants operating in the Middle Atlantic States indicate that the rate of productive operations in 1927 as a whole was about 0.7 per cent under those witnessed during 1926. During the first quarter of 1927 industrial operations were continually under the same period of 1926, but during the remainder of the year operations have been at times slightly over those reported for the same months in 1926. In general the year closed with the rate of productive operations slightly over those at the close of 1926.

The leather and its products industry was the only primary industrial group in the Middle Atlantic States to report December operations over those of the previous November. The rolling mills and steel plants were operating at a rate 4.5 per cent under November, and the operations in the ferrous and non-ferrous working plants during December were 5.5 per cent under November. The textile industry reported December productive activities 7.6 per cent over December, 1926.

*Indexes of Productive Activity in the Middle Atlantic States*

Figures Adjusted for Number of Working Days

| | Dec., 1927 | Nov., 1927 | Dec., 1926 | Average for Full Year, 1927 | Average for Full Year, 1926 |

## *"Just a Fair Living"*

IN THESE words Martin J. Insull, speaking at last week's public relations conference of the operating companies of the New England Public Service Company, at Augusta, Me., summarized the material results of hard work in the electric light and power industry. Pointing out that the tangible reward of shouldering big burdens to carry electric service to an ever-increasing public is only a fair living, the speaker declared that the chief incentive for such heavy toil is the satisfaction of "making two blades of grass grow where one grew before, which is the final reason for wanting to accomplish anything big and worth-while." The truth of Mr. Insull's phrasing may be questioned by those who have never looked behind the scenes into rooms where bankers, utility executives, department heads and operating engineers grapple with the problems of system development and service betterment, or by those who have missed the thrill brought by a comprehension of the devotion of staffs and employees to duty under conditions that tax human endurance to the extreme. It will not be scoffed at by those who realize the limited returns on capital associated with public utility activities, the joy in creating efficient organizations and *materiel* to serve all society electrically, and the privilege of sharing in the advancement of the most wonderful of the modern useful arts. These are compensations unknown to the profiteer, members of whose species are few and far between in the habitats of the light and power industry.

* * * *

## *Economic Factors Govern Bond Prices*

LAST summer the ratio between demand and supply of power and light bonds was temporarily deranged, and the supply on bankers' shelves accumulated inconveniently. Referring to the incident recently, a representative of one of the largest institutional investors in the country said to a group of bankers: "You gentlemen and the borrowers of capital have been reveling for about two years in a sellers' market. In such a period it is not surprising that the strong wine of success and prosperity should go to your heads, making you disregard some of the reasonable needs of the investor, making you forget that the capacity of the buyer is not boundless and that his appetite can in time be dulled by constantly boosted prices. This was the reason for the painful attack of indigestion last June."

Evidence is lacking that there has been any factor in the price rise beyond the economic relation between supply and existing or potential demand—accelerated, of course, by aggressive marketing activities. If insufficient attention be paid to the timing of new issues, so that too many are placed on the market at one time, what has been called indigestion will naturally occur. Fortunately, investment bankers have commenced to pay more attention to this point. But recent financing has been carried on at still lower rates than those ruling last summer, and new issues are being absorbed very readily. The price of money is determined by a combination of economic factors which authorities generally agree point to still lower levels for power and light financing, in view of the fact that these issues have been selling out of line in relation to railroad issues and possibly others of lower yield and that their merit is just now being appreciated. The rise in price does not seem to require any explanation involving artificial manipulation.

* * * *

## *Senator Walsh Restricts the Scope of His Resolution*

HEARINGS before the Senate committee on interstate commerce to determine whether or not there shall be an investigation of the electric light and power industry, and if so what the scope of that investigation shall be, were resumed on Tuesday last. Up to that time the public utilities had not been heard nor had any case been made against them. However, representatives of the state public service commissions were very outspoken and effective in their demand that Congress do not encroach on the rights of sovereign states in any investigation it may order. In fact, the burden of their testimony indicated that the state commissions have handled and can handle the situation satisfactorily in so far as the ultimate consumer and the rates he pays for service are concerned. Even where electricity crosses state lines, joint action by the commissions of the states involved has been effective. Investment bankers and large investors in public utility securities, such as insurance companies, have also urged the necessity of caution on the part of the interstate commerce committee lest public confidence in the financial stability of the public utilities be shaken and they experience difficulty in raising the billions needed for extensions and betterments of service in every part of the country.

The most significant event of the hearing up to the time mentioned, however, has been the fact that Senator Walsh, when confronted with legal objections to the elaborateness of the investigation he proposed, offered to modify his resolution and restrict its scope. Thus the entire situation may be changed. As a result the utility companies, which might previously have been expected to oppose the resolution even more vigorously than the commissioners, bankers and insurance companies had done, may find watchful waiting more effective than elaborate defense.

## *Aviation and Transmission Lines*

LANDING is one of the most difficult operations in aviation, particularly during forced descents. It will probably remain a great hazard unless some revolutionary development such as the neutralization of gravity by other than mechanical means comes about. Among the many dangers of a forced landing at night is the possibility that the descent may end by a collision with one of the electric transmission lines which are spreading over the whole country.

Near and around many flying fields this danger is now guarded against by placing red lights on a sufficient number of the poles to indicate the location of the line. It is not now practicable thus to indicate the positions and routes of transmission lines throughout their whole lengths, but such precautions are being asked for, and it is certain that the future will see not only a great increase in the number of such requests, but probably also the substitution of demands in the place of requests. Already one large interconnected system has been asked so to indicate some of its lines along traveled air lanes. It would not be impossible to mount a floodlamp and a small transformer on every transmission pole and tower in the country. But it would probably be impossible to operate any line so equipped satisfactorily. Furthermore, the power companies can hardly be expected to spend the money to do it.

However, is it necessary that the problem be solved in this way? Possibly a satisfactory solution is already at hand. Claude and other glow-tube illuminants are already finding large commercial applications. They require high voltages at the tube terminals. High voltages are available at the ends of the cross-arms on every transmission pole and tower. To the observer in the sky twenty years from now perhaps the earth at night will be an eerie sight to look upon, with varicolored glowing lines marking the routes of transmission. Or electromagnetic radiations from the transmission lines may be used through the medium of detectors on the airplanes to indicate proximity of danger.

* * * *

## *Definitions Needed for Industry Terms*

MANY words used by electrical men have not been defined. Such a word is "interconnection." It may mean a transmission system, a tie line, a network or a busbar for generating stations. A definite economic meaning is a transmission line between two electrical systems of different ownership in which energy may flow in either direction. Another modification would mean a line between two separately operated electrical systems in which energy may flow in either direction. If there is no provision for two-way energy flow between individual systems, the term "transmission line" should be used. As now used, "interconnection" gives as loose a conception of actualities as does "superpower" or "giant power."

"Load factor" and "capacity factor" continue to be used as economic yardsticks. But they are not so valid as in the days when electrical systems became connected together. On many properties energy is purchased in large amounts or is sold to other utilities in large amounts. In other cases generating-station equipment is used as a regulatory device for system voltage or power-factor control. These developments in operating practice call for a revision of old terms or the addition of new terms. A load factor and plant factor based on owned generating equipment and the energy it produces have value, but system load and plant factors wherein all generated and purchased energy and equipment are considered are of greater economic importance. Many utilities now mix generated energy, purchased energy and owned and interconnected generating capacity to give meaningless load and capacity factor values. Utility practice should be more uniform.

It is important that terms used in economic measures and comparisons be defined more rigidly. New and useful terms may be needed to measure values on the present extended systems. A study of these things would be worth-while work for the N. E. L. A. and A. I. E. E. committees most intimately concerned with the formulation of definitions. Electrical men should talk the same language and should be precise in their use of words.

* * * *

## *Criticism and Praise for the Commercial Section*

PROGRESS in the commercial thinking of the power industry has been very clearly mirrored at the group meeting of the N.E.L.A. Commercial Section committees in recent years. Last week eleven of these committees were in session in Chicago, with more than two hundred men in attendance. Out of this gathering come some very definite reflections.

No one can deny that the Commercial Section is on the march. It has been fortunate in the energetic leadership of a small group of men who recognize not only the opportunity but the responsibility that waits upon their action. And so, particularly in the last two years of Chairman Davidson's administration, there have been more purpose, more courage and more spirit in the work. But there still remains one very fundamental weakness in the situation that needs deliberation and attention. Frankly, there is far too great a willingness among the sales managers who journey to these meetings to devote themselves to the criticism of the programs offered by the chairmen of the committees, with a complete disregard on their own part of any obligation to contribute to the planning. The committee chairmen were well chosen this year. They have been conscientious in their efforts. But the lingering impression of last week's meetings was one of discouragement that these men, with bumper attendance, could secure so little active assistance and support out of their meetings from men eager-minded to improve the planning and promote its application.

Some gratifying progress was made, however, by several of the groups. The general merchandising committee made an outstanding contribution in bringing to a successful close a series of joint conferences with the national associations of the other retailers of electrical appliances, the purpose of which was to define some guiding principles by which to mold the oft-conflicting merchandising policies of both the power companies and the competing trades. Chairman Greenwood has rendered a splendid service by this achievement and deserves the thanks of the industry. His committee is also undertaking a broad laboratory and field study of the oil burner and is launching a national contest to promote residence consumption. The electrical advertising and power committees also are showing enterprise.

More than ever is seen the need for a commercial executive at headquarters who can assist committee work, support and stimulate the chairmen, develop a more orderly procedure and bring continuity of purpose and program. Chairman Davidson announced that such a man would probably be appointed within a few weeks. This is good news.

* * * *

## *Needed Betterments in Interconnection Practice*

As LOADS upon interconnected systems increase the pressure upon operators to furnish service of the highest grade over wide areas grows apace. Managers with vision are thinking intently about ways and means of improving practice. Fine work has been done in the past in this field, but in some cases development has been so rapid that erratic service and unfortunate interruptions have crept into operation, and these need to be taken in hand at once. If matters are allowed to drift, some power companies may have to discontinue interconnected operation in order to maintain the quality of service demanded by economic conditions in certain areas of major importance, and the art will be retarded by just so much.

Several lines of treatment are indicated, as our medical friends express it. Among these are improved communication, better records of intersystem procedure as apart from log-sheet data, the maintenance of increased local reserve capacity ready for immediate use, more intercompany visits and co-operative discussions by engineers and operators, interchange of written information and data along broader lines, provision for the education of load dispatchers in the more professional phases and larger problems of intersystem working, and the devotion of more engineering study to the problems of system ties and allied apparatus from the standpoint of service reliability.

It would take many pages to discuss each of these betterments thoroughly. Steps are being taken on many properties to eliminate the handicaps of inadequate communication under normal conditions, as well as to provide for emergencies. Too much indirect communication still hampers operators seeking to act promptly with complete understanding of conditions outside their own systems. Rapid progress is being made in the application of selective telephone equipment to carrier transmission over power wires, and good headway is also being made in the improvement of ordinary wire facilities between points hitherto reached circuitously. Space radio appears to have possibilities, at least in emergencies, but we shall know more about this in the near future. In the field of records, loose-leaf systems offer a means of more effectively preserving comments, notes and data bearing upon specific interconnection problems than the log sheet permits, and it would be helpful if a wider interchange of forms for such work took place.

Executives are responding in progressive companies to the appeal of more complete instrumentation in connection with tie-in service, and considerable work is being done on the problem of obtaining simultaneous load readings. Operators are getting better acquainted by personal contacts brought about through such means as the New England System Operators' Club, for example, and by at least occasional visits to neighboring dispatching offices. Reserve capacity is still too much neglected locally, many operating men apparently thinking that this can be cut to the bone under interconnection, whereas sudden reversed demands of the order of from 20,000 kw. to 60,000 kw. are not uncommon in large work, with their decidedly "bumpy" effect on regulation and frequency control. The installation of more than one high-powered transmission circuit on a single tower line is being questioned, and so it goes. These and other live issues need to be faced very frankly in view of their bearing upon quality of service. Protection against lightning is a vital problem in interconnection. In some areas 90 per cent of the tie-in troubles have been credited to Nature's heavy artillery, and the economic side of such protection in relation to load values presses for consideration.

* * * *

## *Midwinter Meeting of Leagues Shows Trend from Talk to Work*

SOME men have felt that the league conferences held each year at Association Island have provided too little time for the discussion of the practical problems of operating a local electrical league. The major purpose at "the Island" has been to interpret the league movement to the industry, and to the league men their responsibility to national policies. Therefore a midwinter conference of league officials was held last week in Chicago devoted entirely to questions of local administration and development. About a hundred men were present, representing thirty-five active leagues that are engaged in promotion work, scattered from Boston to Denver and from Winnipeg to New Orleans. It was an earnest, hard-working meeting that lasted two days and was enthusiastically voted a successful experiment.

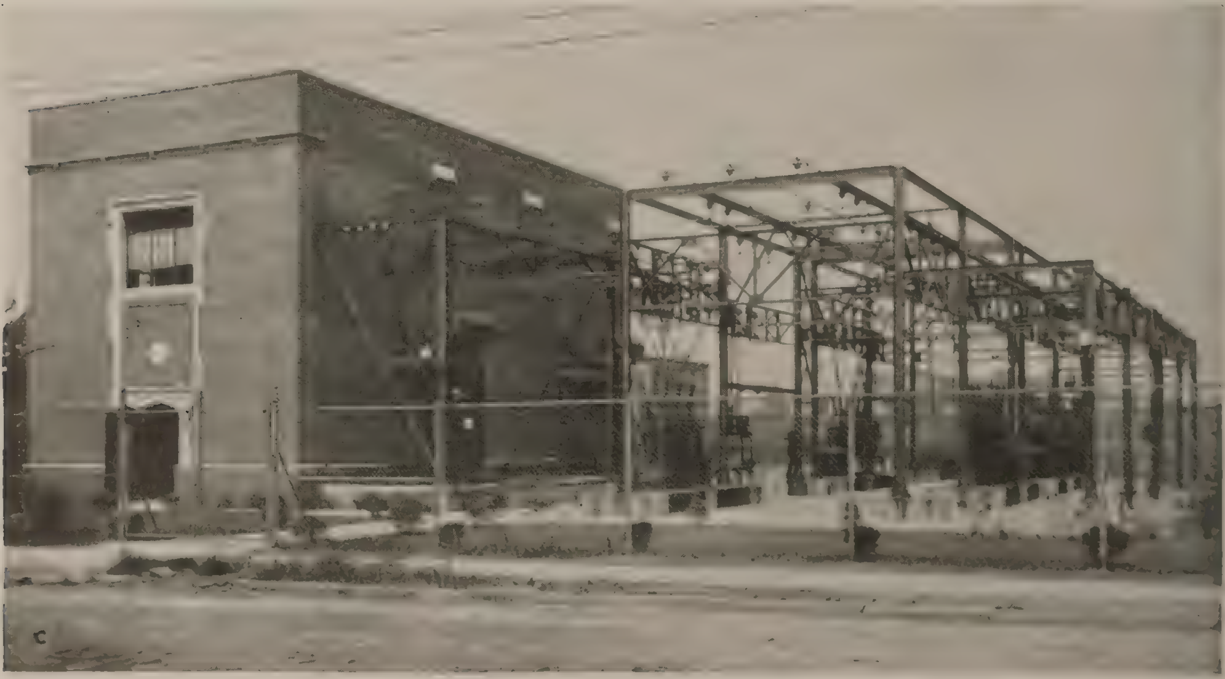
It would seem that here also co-operation is trending out of the talking stage into the working stage, and the league men are becoming less concerned with their local independence in policy and program and more interested in tying into national movements that offer practical opportunities for effective co-ordination in market development. A few years ago every league felt that to operate the "red seal" plan each city should set its own standard of adequacy in house wiring. But last week they voted to establish a national specification so that the idea may be nationally advertised and adapted to the thousands of house plans that now emanate from agencies doing a country-wide business. And the "red seal" plan is now being revised to remove former restrictions and facilitate its use, so that the leagues can put more power behind the present movement to make house wiring adequate. Here lies the chief immediate purpose in league thinking—which is as it should be.

Another encouraging sign was the frank discussion of the small house-wiring contractor as a league responsibility. He does not belong to the league at present. But it was agreed that the league must reach him and influence him to do a more adequate job. Also, there was a demand for more service from the members of the League Council, that these men should take responsibility for visiting all the leagues of their districts, to bring them the outside viewpoint and to study league problems more closely as of growing importance in the making of national plans. The council will take on this broader function. It was a meeting of unusual interest and very satisfying results.

# Modern Jersey Substations

THE Public Service Corporation of New Jersey has been engaged in a major program of substation building. High-voltage switching stations have been built with a view to future interconnections and extension of the 132-kv. transmission system. These substations use the supported bus structure design. A second type, designed for large city service, incorporates a control building with an outdoor installation. A third design serves small towns or isolated industrial plants.

A—Athenia switching station.
B—Outdoor substation for serving Princeton.
C—Bergen Point substation for local service.



# Economy of High Efficiency

## in the Medium-Sized Power Station

Method of analysis outlined. High-temperature steam justified. Effect of capacity factor and fuel cost is dominant

By Alfred Iddles

*Chief Engineer Day & Zimmermann Engineering & Construction Company*

*Many large power stations have warranted the installation of equipment that will give very high economy in operation. High pressures and temperatures, air heaters and economizers, water-cooled furnaces with high rates of heat absorption and other advanced practices have been used successfully. Prospects for the design and installation of many small stations make it advisable to evaluate these advances in the art for the smaller plants. In this article Mr. Iddles has outlined a method of attack in detail. The data will vary in an individual case and local conditions will modify conclusions, but the method of analysis is general and should serve as a guide to station designers. Mr. Iddles used specific data to make clear the method, and it is hoped that this article will stimulate design thinking for the medium-sized power station.*—Editor.

POWER plant design has received a great deal of engineering attention during the last ten years. With the increasing cost of coal it became economically possible and necessary to get higher efficiencies. Whereas before the war stations producing power at 2 lb. of coal per kilowatt-hour were considered very efficient, we now have large central stations that produce a kilowatt-hour for about 1 lb. of coal. The question often arises whether the higher investment and maintenance charges do not overshadow the reduced fuel costs of these highly efficient plants and whether it is advisable for small and medium-sized power plants to install the heat-saving devices used by these large modern stations. Quite often it is reasoned that if high efficiency pays for the larger stations, it must also be advantageous for the smaller plants.

So many variables enter into the production costs of electric energy that no direct answer can be given to these problems; each plant design should be considered on its own merits, subject to the variables applying to that plant, such as price of fuel, load, etc. Nevertheless it is possible to make fair comparisons between different plant designs and to predict fairly accurately which layout will be the most economical at various loads and fuel prices. It is the purpose of this article to show comparative production costs of various designs for a medium-sized power plant.

### Basic Assumptions for Design

Assume that a power plant is needed which has to produce 125,000,000 kw.-hr. per year and that the daily loads are about as follows: eight hours at 7,500 kw., thirteen hours at 16,000 kw. and three hours at 25,000 kw. With three 10,000-kw. turbo-generators the load can be carried very economically and in case of serious trouble to one of the units the peak load can still be carried on two machines. Three 1,000-hp. boilers would carry the peak load when operated at about 300 per cent rating and four boilers should be installed in order to have a spare.

### Fixing Steam Pressure and Temperature

In determining steam conditions pressures over 400 lb. will likely not be considered, since it would require reheating of the steam between the high- and low-pressure stages, which of course would be too complicated and costly for a plant of this size. Comparing production costs with steam at (*a*) 250 lb., 600 deg. F.; (*b*) 250 lb., 700 deg. F., and (*c*) 400 lb., 700 deg. F. ought to give a fair idea of which steam condition to select. The following conditions will obtain if these assumptions are made:

| | (*a*) | (*b*) | (*c*) |
|---|---|---|---|
| Steam consumption, lb. per kw.-hr. at 28½ in., vacuum | 11.25 | 10.3 | 9.9 |
| Heat in steam, B.t.u., per lb. | 1,313 | 1,362 | 1,356 |
| Heat in feed water, B.t.u., per lb. | 180 | 180 | 180 |
| Heat supplied by boiler, per lb. of steam | 1,133 | 1,182 | 1,176 |
| Heat supplied by boiler, per kw.-hr. | 12,780 | 12,200 | 11,640 |

With 13,000 B.t.u. coal and 75 per cent boiler efficiency 125,000,000 kw.-hr. per year will require:

(1) 125,000,000 × (12,780 — 12,200) ÷ (13,000 × 0.75 × 2,000) = 3,725 tons of coal more for 250-lb. 600-deg. F. steam than for 250-lb. 700-deg. F. steam.

(2) 125,000,000 × (12,200 — 11,640) ÷ (13,000 × 0.75 × 2,000) = 3,600 tons of coal more for 250-lb. 700-deg. F. steam than for 400-lb. 700-deg. F. steam.

(3) 125,000,000 × (12,780 — 11,640) ÷ (13,000 × 0.75 × 2,000) = 7,325 tons of coal more for 250-lb. 600-deg. F. steam than for 400-lb. 700-deg. F. steam.

The pumping of boiler-feed water to the 400-lb. pressure boilers would require 480,000 kw.-hr. per year more than pumping to 250-lb. pressure boilers; this necessitates the burning of about 300 tons of coal per year more to feed the high-pressure boilers, so that there will be required (1) 3,725 tons of coal more for 250-lb.

600-deg. F. steam than 250-lb. 700-deg. F. steam, (2) 3,300 tons of coal more for 250-lb. 700-deg. F. steam than for 400-lb. 700-deg. F. steam, (3) 7,025 tons of coal more for 250-lb. 600-deg. F. steam than for 400-lb. 700-deg. F. steam.

The differences in first cost of plants for the three conditions named occur mainly in the boilers, superheaters, boiler-feed pumps, piping and condensing equipment. These costs will be about as follows:

| | (*a*) | (*b*) | (*c*) |
|---|---|---|---|
| Four boilers and superheaters | $112,000 | $120,000 | $130,000 |
| Two feed pumps | 12,000 | 12,000 | 17,000 |
| Piping | 200,000 | 200,000 | 210,000 |
| Condensing equipment | 90,000 | 85,000 | 80,000 |
| Total | $414,000 | $417,000 | $437,000 |

Thus the difference in first cost of the plants will be:

$$b - a = \$3{,}000$$
$$c - b = 20{,}000$$
$$c - a = 23{,}000$$

The difference in investment charges and maintenance costs at 15 per cent will be as follows:

$$b - a = 3{,}000 \times 0.15 = \$450 \text{ per year}$$
$$c - b = 20{,}000 \times 0.15 = 3{,}000 \text{ per year}$$
$$c - a = 23{,}000 \times 0.15 = 3{,}450 \text{ per year}$$

The curves in Figs. 1, 2 and 3 have been constructed to show the actual decrease in production costs under the different steam conditions considered with different prices of coal and energy output. These curves give evidence that steam at 400-lb. pressure 700 deg. F. is the more advantageous unless coal is very cheap and the capacity factor very low.

### AIR HEATERS AND ECONOMIZERS CONSIDERED

For the reasons stated we shall consider only steam conditions of 400 lb. 700 deg. F. in the following computations and shall investigate whether it is advisable to install air preheaters or economizers, or air preheaters and economizers. We have then the following four cases:

Case I: Three 10,000-kw. turbo-generators.
Four 1,000-hp. boilers with superheaters.

Case II: Three 10,000-kw. turbo-generators.
Four 1,000-hp. boilers with superheaters.
Four air preheaters (assume 10,000 sq.ft. each).

Case III: Three 10,000-kw. turbo-generators.
Four 1,000-hp. boilers with superheaters.
Four economizers (assume 6,000 sq.ft. each).

Case IV: Three 10,000-kw. turbo-generators.
Four 1,000-hp. boilers with superheaters.
Four air preheaters (10,000 sq.ft. each).
Four economizers (6,000 sq.ft. each).

It is generally conceded that it is economical to heat the feed water with steam extracted from the turbines and to use motor-driven auxiliaries. Using this method for feed-water heating, we can proceed to calculate the steam requirements:

*Case I:*

The steam requirements to generate power will be as follows:

8 hours at 7,500 kw. × 9.9 = 74,300 lb. per hour
13 hours at 16,000 kw. × 9.9 = 158,400 lb. per hour
3 hours at 25,000 kw. × 9.9 = 247,500 lb. per hour

The live steam added at throttle for steam extracted to heat feed water to 270 deg. F. will be as follows: 8 hours at 6,000 lb. per hour, 13 hours at 12,850 lb. per hour and 3 hours at 20,000 lb. per hour.

Thus the total steam to the turbine throttle will be:

8 hours at 74,300 plus 6,000 = 80,300 lb. per hour
13 hours at 158,400 plus 12,850 = 171,250 lb. per hour
3 hours at 247,500 plus 20,000 = 267,500 lb. per hour

If 2 per cent is assumed for soot blowers and losses, then the total steam to be generated in the plant will be:

8 hours at 80,300 plus 1,600 = 81,900 lb. per hour
13 hours at 171,250 plus 3,425 = 174,675 lb. per hour
3 hours at 267,500 plus 5,350 = 272,850 lb. per hour

To generate this steam the boilers will probably be operated as follows: 8 hours, two boilers at 136 per cent rating; 13 hours, three boilers at 195 per cent rating, and 3 hours, three boilers at 304 per cent rating.

The efficiencies of the steam-generating units, will be about as follows:

| Rating, Per Cent | Efficiency, Per Cent | Steam Per Pound of Coal |
|---|---|---|
| 150 | 75 | 8.78 |
| 200 | 73 | 8.55 |
| 300 | 70 | 8.2 |

With these efficiencies the coal used per year for Case I will be as follows:

$$365 \times 8 \times \frac{81{,}900}{8.78} = 27{,}200{,}000 \text{ lb.} = 13{,}600 \text{ tons}$$

$$365 \times 13 \times \frac{174{,}675}{8.55} = 97{,}000{,}000 \text{ lb.} = 48{,}500 \text{ tons}$$

$$365 \times 3 \times \frac{272{,}850}{8.2} = 36{,}500{,}000 \text{ lb.} = 18{,}250 \text{ tons}$$

Total = 80,350 tons

*Case II:*

The steam to be generated is the same as in Case I, the efficiencies of the steam-generating units will be about:

| Rating, Per Cent | Efficiency, Per Cent | Steam per Pound of Coal |
|---|---|---|
| 150 | 81 | 9.48 |
| 200 | 79 | 9.24 |
| 300 | 77 | 9.0 |

The coal used per year with these efficiencies will be:

$$365 \times 8 \times \frac{81{,}900}{9.48} = 25{,}200{,}000 \text{ lb.} = 12{,}600 \text{ tons}$$

$$365 \times 13 \times \frac{174{,}675}{9.24} = 89{,}800{,}000 \text{ lb.} = 44{,}900 \text{ tons}$$

$$365 \times 3 \times \frac{272{,}850}{9.0} = 33{,}200{,}000 \text{ lb.} = 16{,}600 \text{ tons}$$

Total = 74,100 tons

*Case III:*

Steam requirements to generate power:

8 hours at 7,500 kw. × 9.9 = 74,300 lb. per hour
13 hours at 16,000 kw. × 9.9 = 158,400 lb. per hour.
3 hours at 25,000 kw. × 9.9 = 247,500 lb. per hour

Live steam added at the throttle for steam extracted to heat feed water to 210 deg. F. will be:

8 hours at 3,250 lb. per hour, 13 hours at 7,000 lb. per hour and 3 hours at 10,800 lb. per hour.

The total steam to the turbine will then be:

8 hours at 74,300 plus 3,250 = 77,550 lb. per hour
13 hours at 158,400 plus 7,000 = 165,400 lb. per hour
3 hours at 247,500 plus 10,800 = 258,300 lb. per hour

Adding 2 per cent for soot blowers and losses, then the total steam to be generated will be:

8 hours at 77,500 plus 1,550 = 79,100 lb. per hour
13 hours at 165,400 plus 3,300 = 168,700 lb. per hour
3 hours at 258,300 plus 5,160 = 263,460 lb. per hour

The efficiencies of the steam-generating units will be about:

| Rating, Per Cent | Efficiency, Per Cent | Steam Per Pound of Coal |
|---|---|---|
| 150 | 83 | 9.22 |
| 200 | 81 | 8.99 |
| 300 | 79 | 8.77 |

The coal used per year will therefore be:

$$365 \times 8 \times \frac{79{,}100}{9.22} = 25{,}050{,}000 \text{ lb.} = 12{,}525 \text{ tons}$$

$$365 \times 13 \times \frac{168{,}700}{8.99} = 89{,}000{,}000 \text{ lb.} = 44{,}500 \text{ tons}$$

$$365 \times 3 \times \frac{263{,}460}{8.77} = 32{,}800{,}000 \text{ lb.} = 16{,}400 \text{ tons}$$

Total = 73,425 tons

*Case IV:*

The steam to be generated is the same as in Case III; the efficiencies of the steam-generating units will be:

| Rating, Per Cent | Efficiency, Per Cent | Steam Per Pound of Coal |
|---|---|---|
| 150 | 86 | 9.54 |
| 200 | 84 | 9.32 |
| 300 | 82 | 9.1 |

The coal used per year will then be:

$$365 \times 8 \times \frac{79{,}100}{9.54} = 24{,}200{,}000 \text{ lb.} = 12{,}100 \text{ tons}$$

$$365 \times 13 \times \frac{168{,}700}{9.32} = 86{,}000{,}000 \text{ lb.} = 43{,}000 \text{ tons}$$

$$365 \times 3 \times \frac{263{,}460}{9.1} = 31{,}700{,}000 \text{ lb.} = 15{,}850 \text{ tons}$$

Besides the equipment which the plants in the four cases have in common, Case I has three high-pressure closed heaters; Case II has three high-pressure closed heaters, four air preheaters and larger fans and motors; Case III has four economizers and larger fans and motors; Case IV has four economizers, four air preheaters and larger fans and motors.

To house the power plant equipment for the four cases, the turbine room will be the same size in each case, but the size of the boiler room will vary about as follows:

Case I: 150 × 55 × 50 = 412,500 cu.ft.
Case II: 150 × 65 × 50 = 487,500 cu.ft.
Case III: 150 × 65 × 50 = 487,500 cu.ft.
Case IV: 150 × 65 × 50 = 487,500 cu.ft.

### Comparative Costs of Plants

The first cost of the power plant in each of these four cases will be a constant, *C*, plus an amount depending on each installation:

| | |
|---|---|
| Case I costs: | *C* |
| Three bleeder heaters with piping | $10,000 |
| | *C* plus $10,000 |
| Engineering and construction, 25 per cent | 0.25 (*C* plus 10,000) |
| Total | 1.25 (*C* plus $10,000) |

| | |
|---|---|
| Case II costs: | *C* |
| Three bleeder heaters with piping | $10,000 |
| Four air preheaters | 40,000 |
| Ductwork for air preheaters and insulation | 10,000 |
| Extra for larger fans and motors | 3,000 |
| Extra for larger building | 22,500 |
| | *C* plus $85,500 |
| Engineering and construction, 25 per cent | 0.25 (*C* plus 85,500) |
| Total | 1.25 (*C* plus $85,500) |

| | |
|---|---|
| Case III costs: | *C* |
| Four economizers | $70,000 |
| Extra for larger fans and motors | 2,000 |
| Extra for larger building | 22,500 |
| | *C* plus $94,500 |
| Engineering and construction, 25 per cent | 0.25 (*C* plus 94,500) |
| Total | 1.25 (*C* plus $94,500) |

| | |
|---|---|
| Case IV costs: | *C* |
| Four economizers | $70,000 |
| Four air preheaters | 40,000 |
| Duct work for air preheater and insulation | 10,000 |
| Extra for larger fans and motors | 4,000 |
| Extra for larger building | 22,500 |
| | *C* plus $146,500 |
| Engineering and construction, 25 per cent | 0.25 (*C* plus 146,500) |
| Total | 1.25 (*C* plus $146,500) |

In all probability the same number of operators and laborers will be required to operate the power plant in each of the four cases. The maintenance cost, however, will vary.

If *M* is the maintenance cost on the equipment, which all cases have in common, then the maintenance costs will be:

Case I: *M* plus $300
Case II: *M* plus $2,500
Case III: *M* plus $3,000
Case IV: *M* plus $4,500

The difference in energy required for auxiliaries depends principally on the loads on the forced and induced draft fans. The energy required for these fans will be:

Case I, Induced Draft Fans:
8 hours, two fans at 30 kw. = 480 kw.-hr.
13 hours, three fans at 45 kw. = 1,760 kw.-hr.
3 hours, three fans at 60 kw. = 540 kw.-hr.
Forced Draft Fans:
8 hours, two fans at 30 kw. = 480 kw.-hr.
13 hours, three fans at 40 kw. = 1,560 kw.-hr.
3 hours, three fans at 50 kw. = 450 kw.-hr.
5,270 kw.-hr. per day

Case II, Induced Draft Fans:
8 hours, two fans at 70 kw. = 1,120 kw.-hr.
13 hours, three fans at 85 kw. = 3,320 kw.-hr.
3 hours, three fans at 100 kw. = 900 kw.-hr.
Forced Draft Fans:
8 hours, two fans at 45 kw. = 720 kw.-hr.
13 hours, three fans at 55 kw. = 2,150 kw.-hr.
3 hours, three fans at 75 kw. = 675 kw.-hr.
8,885 kw.-hr. per day

Case III, Induced Draft Fans:
8 hours, two fans at 70 kw. = 1,120 kw.-hr.
13 hours, three fans at 85 kw. = 3,320 kw.-hr.
3 hours, three fans at 100 kw. = 900 kw.-hr.
Forced Draft Fans:
8 hours two fans at 30 kw. = 480 kw.-hr.
13 hours, three fans at 40 kw. = 1,560 kw.-hr.
3 hours, three fans at 50 kw. = 450 kw.-hr.
6,830 kw.-hr. per day

Case IV, Induced Draft Fans:
8 hours, two fans at 95 kw. = 1,520 kw.-hr.
13 hours, three fans at 110 kw. = 4,290 kw.-hr.
3 hours, three fans at 150 kw. = 1,350 kw.-hr.
Forced Draft Fans:
8 hours, two fans at 45 kw. = 720 kw.-hr.
13 hours, three fans at 55 kw. = 2,150 kw.-hr.
3 hours, three fans at 75 kw. = 675 kw.-hr.
10,705 kw.-hr. per day

If *E* is the coal required per year to generate the auxiliary power for Case I, then the auxiliary power for the other cases requires:

Case II:
$E$ plus $(3{,}615 \times 1.25 \times 365) \div 2{,}000 = E$ plus 825 tons of coal
Case III:
$E$ plus $(1{,}560 \times 1.25 \times 365) \div 2{,}000 = E$ plus 356 tons of coal
Case IV:
$E$ plus $(5{,}435 \times 1.25 \times 365) \div 2{,}000 = E$ plus 1,240 tons of coal

The total coal consumed exclusive of banking will then be:

Case I: 80,350 plus $E$ plus 0 = $E$ plus 80,350 tons per year
Case II: 74,100 plus $E$ plus 825 = $E$ plus 74,925 tons per year
Case III: 73,425 plus $E$ plus 356 = $E$ plus 73,781 tons per year
Case IV: 70,950 plus $E$ plus 1,240 = $E$ plus 72,190 tons per year

The fixed charges on the power plant installation will include interest on the investment, depreciation, taxes and insurance and will probably form an annual charge of 13 per cent on the money invested. The fixed charges in the four cases will then be:

Case I: 1.25 ($C$ plus 10,000) × 0.13
Case II: 1.25 ($C$ plus 85,500) × 0.13
Case III: 1.25 ($C$ plus 94,500) × 0.13
Case IV: 1.25 ($C$ plus 146,500) × 0.13

The total production costs consist of the following principal items: (*a*) fuel, (*b*) maintenance and supplies, (*c*) labor, (*d*) fixed charges.

The total production costs will therefore be:

Case I: (*a*) $(E + 80{,}350)$ tons of coal, (*b*) $(M + 300)$ dollars, (*c*) L, (*d*) $1.25\ (C + 10{,}000)\ 0.13$ dollars. Total, constant $K + 1{,}925$ dollars $+ 80{,}350$ tons of coal.

Case II: (*a*) $(E + 74{,}925)$ tons of coal, (*b*) $(M +$

2,500) dollars, (*c*) *L*, (*d*) $1.25(C + 85{,}500)$ 0.13 dollars. Total, constant $K$ + 16,400 dollars + 74,925 tons of coal.

Case III: (*a*) $(E + 73{,}781)$ tons of coal, (*b*) $(M + 3{,}000)$ dollars, (*c*) *L*, (*d*) $1.25(C + 94{,}500)$ 0.13 dollars. Total, constant $K$ + 18,350 dollars + 73.781 tons of coal.

Case IV: (*a*) $(E + 72{,}190)$ tons of coal, (*b*) $(M + 4{,}500)$ dollars, (*c*) *L*, (*d*) $1.25(C + 146{,}500)$ 0.13 dollars. Total, constant $K$ + 28,300 dollars + 72,190 tons of coal.

The difference in production costs of these plants for various coal prices, is given in the following table, which shows these costs above constant $K$:

| Price of Coal... | $1 | $2 | $3 | $4 | $5 | $6 | $7 |
|---|---|---|---|---|---|---|---|
| Case I.. | $82,275 | $162,625 | $242,975 | $323,325 | $403,675 | $484,025 | $564,375 |
| Case II. | 91,325 | 166,250 | 241,175 | 316,100 | 391,025 | 465,950 | 540,875 |
| Case III. | 92,131 | 165,912 | 239,693 | 313,474 | 387,255 | 461,036 | 534,817 |
| Case IV. | 100,490 | 172,680 | 244,870 | 317,060 | 389,250 | 461,440 | 533,630 |

The difference in production costs with various fuel prices is shown in graphical form in Fig. 4. All the foregoing calculations are based on an annual output of 125,000,000 kw.-hr., which for the size plant under consideration is about a 50 per cent capacity factor. In order to ascertain what the difference in production costs would be with a 25 per cent capacity factor, the graphs in Fig. 5 have been prepared.

### STOKERS OR PULVERIZED FUEL

Consider now whether it is advisable to install stokers or pulverized coal equipment for these four boilers. The opinion has often been expressed that burning coal in pulverized form will produce much higher efficiency than when burned on stokers. The results obtained with stoker-fired installations at the plants of the Brooklyn Edison Company, the Philadelphia Electric Company and at Hellgate show, however, that practically just as good results can be obtained with stoker-fired boilers as with pulverized coal. The heat balances for both kinds of firing show that the losses are about the same except that the stoker-fired boilers show more ashpit losses. These ashpit losses run especially high when the boilers are forced to high ratings. On account of these ashpit losses, we shall credit the pulverized fuel-fired boilers with 3 per cent less fuel consumption in the following calculations.

Comparing power plants built recently, we find that the boiler room of the bin-type pulverized-coal plant exceeds the boiler room of the stoker-fired plant about 20 ft. in height. The combustion chamber of the pulverized coal-fired boiler is also considerably larger than the combustion chamber of the stoker-fired boiler. The building and the boiler settings of the pulverized-coal plant will therefore be more expensive than those of the stoker-fired plant.

Since difference in cost will all be in the boiler house, we shall compare these costs only. The cost of the boiler house for the pulverized coal plant will be:

| | |
|---|---|
| Boiler house, building | $245,000 |
| Pulverized fuel equipment (no driers) | 100,000 |
| Boilers and superheaters | 130,000 |
| Boiler settings | 85,000 |
| Fans and motors | 18,000 |
| Ash-removal equipment | 15,000 |
| Steel plate work | 30,000 |
| Miscellaneous equipment | 130,000 |
| Total | $753,000 |

The cost of the boiler room for the stoker-fired plant will be:

| | |
|---|---|
| Boiler house, building | $195,000 |
| Underfeed stokers | 80,000 |
| Boilers and superheaters | 130,000 |
| Boiler settings | 55,000 |
| Fans and motors | 30,000 |
| Ash-removal equipment | 15,000 |
| Steel-plate work | 25,000 |
| Miscellaneous equipment | 125,000 |
| Total | $655,000 |

The pulverized-coal plant will thus cost $98,000 more than the stoker-fired plant, exclusive of engineering and construction charges.

The labor for the boiler room of the pulverized-coal plant will be as follows:

| | Per Month |
|---|---|
| Firemen, three at $160 | $480 |
| Boiler-room helpers, three at $125 | 375 |
| Coal-handling men, three at $125 | 375 |
| Coal-preparation men, four at $145 | 580 |
| Fan men, three at $145 | 435 |
| Locomotive crane engineer | 200 |
| Locomotive crane fireman | 160 |
| Ash man | 125 |
| Superintendence | 300 |
| | $3,030 |
| Or, per year | $36,360 |

The labor for the boiler room of the stoker-fired plant will be:

| | Per Month |
|---|---|
| Firemen, three at $160 | $480 |
| Assistant firemen, three at $195 | 435 |
| Boiler-room helpers, three at $125 | 375 |
| Coal-handling men, three at $125 | 375 |
| Ash men, two at $125 | 250 |
| Fan men, three at $145 | 435 |
| Locomotive crane engineer | 200 |
| Locomotive crane fireman | 160 |
| Superintendence | 300 |
| | $3,010 |
| Or per year | $36,120 |

In accordance with published results, obtained in modern plants of recent date, the annual charges for maintenance and supplies for the pulverized coal plant will be:

| | |
|---|---|
| Pulverized-fuel equipment | $7,500 |
| Boiler settings | 8,500 |
| Fans and motors | 900 |
| Ash-removal equipment | 750 |
| Miscellaneous equipment | 4,000 |
| Total | $21,650 |

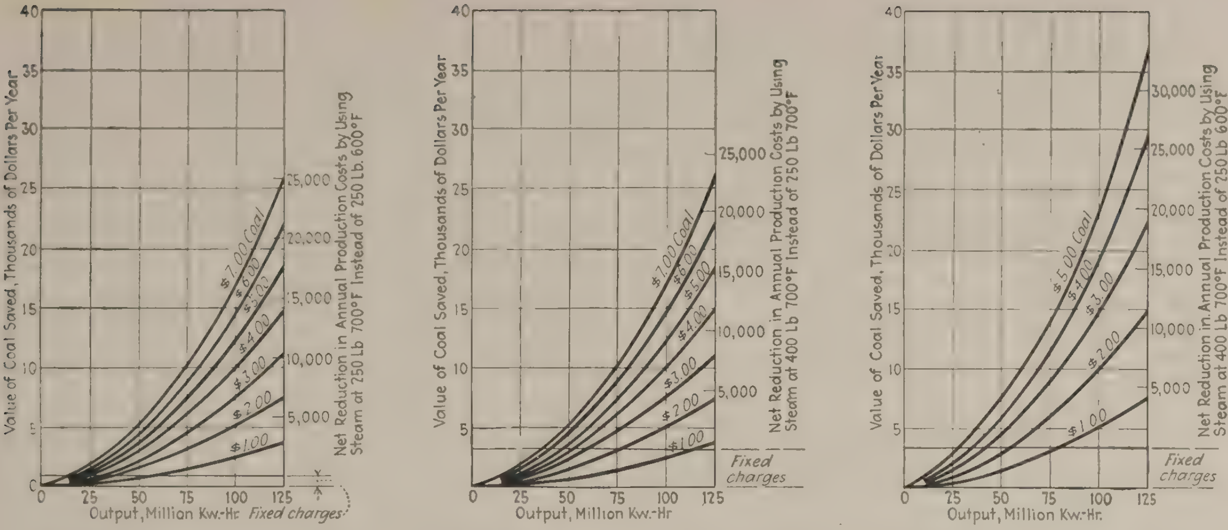
The annual charges for maintenance and supplies for the stoker-fired plant will be:

| | |
|---|---|
| Stokers | $7,500 |
| Boiler settings | 5,500 |
| Fans and motors | 1,500 |
| Ash-removal equipment | 1,500 |
| Miscellaneous equipment | 3,750 |
| Total | $18,750 |

The maintenance costs for the pulverized-coal plants are, therefore, $2,900 per year more than the maintenance costs of the stoker-fired plant.

The maintenance of the pulverized-coal plant is then:

Case I: ($M$ plus 300 plus 2,900) = $M$ plus 3,200
Case II: ($M$ plus 2,500 plus 2,900) = $M$ plus 5,400
Case III: ($M$ plus 3,000 plus 2,900) = $M$ plus 5,900
Case IV: ($M$ plus 4,500 plus 2,900) = $M$ plus 7,400



FIGS. 1, 2 AND 3—NET ECONOMY IN ANNUAL PRODUCTION COSTS EFFECTED BY DIFFERENT COMBINATIONS OF STEAM PRESSURE AND TEMPERATURE AT DIFFERENT YEARLY OUTPUTS

The energy required for auxiliaries in the boiler room of the pulverized-coal plant will be:

| | Case I | Case II | Case III | Case IV |
|---|---|---|---|---|
| Fans | 1,520,000 | 3,100,000 | 2,500,000 | 3,950,000 |
| Pulverized-fuel equipment | 1,950,000 | 1,800,000 | 1,770,000 | 1,730,000 |
| Coal handling | 80,000 | 75,000 | 75,000 | 72,000 |
| Total kw.-hr. per year | 3,550,000 | 4,975,000 | 4,345,000 | 5,752,000 |

The coal used to generate this energy will be: Case I, 2,200 tons; Case II, 3,100 tons; Case III, 2,700 tons; Case IV, 3,600 tons.

The energy required for auxiliaries in the boiler room of the stoker-fired plant will be:

| | Case I | Case II | Case III | Case IV |
|---|---|---|---|---|
| Fans and stokers | 2,000,000 | 3,200,000 | 2,600,000 | 4,050,000 |
| Coal handling | 85,000 | 80,000 | 80,000 | 75,000 |
| Total kw.-hr. per year | 2,085,000 | 3,280,000 | 2,680,000 | 4,125,000 |

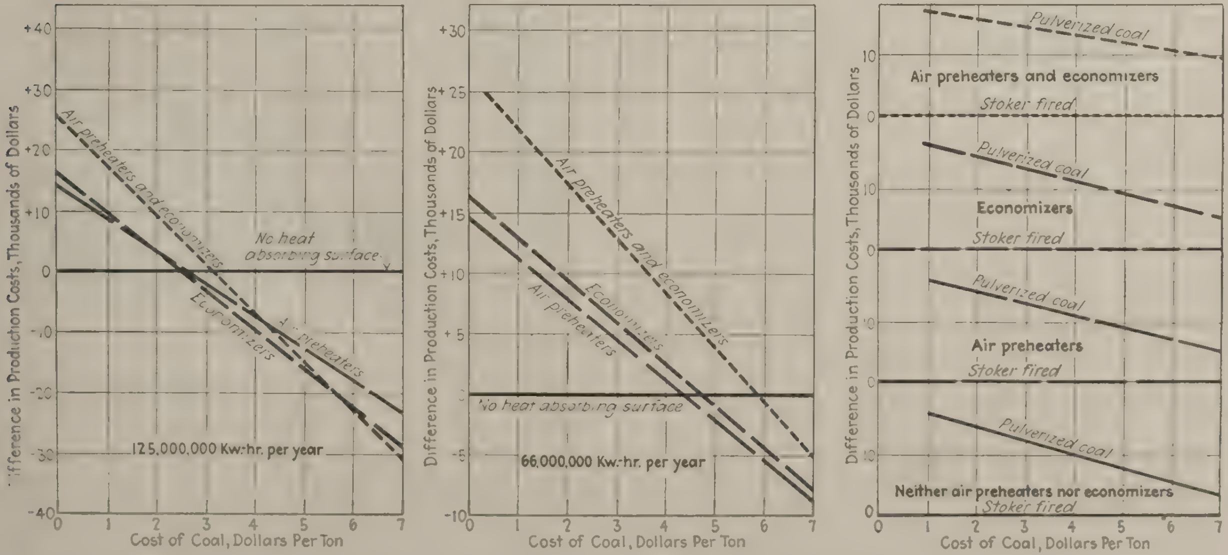
The coal used to generate this energy will be: Case I, 1,300 tons; Case II, 2,050 tons; Case III, 1,670 tons; Case IV, 2,580 tons.

The coal used for starting pulverized-coal furnaces will be about 200 tons per year, while the coal used for banking stoker-fired furnaces will be about 1,000 tons per year.

The coal used per year by the stoker-fired plant will be:

Case I: $E$ plus 80,350 tons
Case II: $E$ plus 74,925 tons
Case III: $E$ plus 73,781 tons
Case IV: $E$ plus 72,190 tons

The coal used per year by the pulverized coal plant will be:



FIGS. 4, 5 AND 6—ECONOMY OF HEAT-ABSORBING SURFACE IN FLUE GASES AT TWO CAPACITY FACTORS AND RELATIVE ECONOMY OF STOKERS AND PULVERIZED FUEL BASED ON PRODUCTION COSTS AND FUEL PRICES

Case I: $E$ plus 0.97 (80,350) plus 920–800 = $E$ plus 78,060 tons
Case II: $E$ plus 0.97 (74,925) plus 1,050–800 = $E$ plus 72,927 tons
Case III: $E$ plus 0.97 (73,781) plus 1,030–800 = $E$ plus 71,797 tons
Case IV: $E$ plus 0.97 (72,190) plus 1,020–800 = $E$ plus 70,244 tons

The fixed charges on the pulverized-coal plant will be:

Case I: 1.25 ($C$ plus 10,000 plus 98,000) 0.13 = 1.25 ($C$ plus 108,000) 0.13
Case II: 1.25 ($C$ plus 85,500 plus 98,000) 0.13 = 1.25 ($C$ plus 183,500) 0.13
Case III: 1.25 ($C$ plus 94,500 plus 98,000) 0.13 = 1.25 ($C$ plus 192,500) 0.13
Case IV: 1.25 ($C$ plus 146,500 plus 98,000) 0.13 = 1.25 ($C$ plus 244,500) 0.13

The total production costs of the pulverized-fuel plant then will be:

Case I: ($a$) $(E + 78{,}060)$ tons of coal, ($b$) $(M + 3{,}200)$ dollars, ($c$) $(L + 240)$ dollars, ($d$) $1.25(C + 108{,}000)\ 0.13$ dollars. Total, constant $K + 20{,}990$ dollars + 78,060 tons of coal.

Case II: ($a$) $(E + 72{,}927)$ tons of coal, ($b$) $(M + 5{,}400)$ dollars, ($c$) $(L + 240)$ dollars, ($d$) $1.25(C + 183{,}500)\ 0.13$ dollars. Total, constant $K + 35{,}480$ dollars + 72,927 tons of coal.

Case III: ($a$) $(E + 71{,}979)$ tons of coal, ($b$) $(M + 5{,}900)$ dollars, ($c$) $(L + 240)$ dollars, ($d$) $1.25(C + 192{,}500)\ 0.13$ dollars. Total, constant $K + 37{,}400$ dollars + 71,927 tons of coal.

Case IV: ($a$) $(E + 70{,}244)$ tons of coal, ($b$) $(M + 7{,}400)$ dollars, ($c$) $(L + 240)$ dollars, ($d$) $1.25(C + 244{,}500)\ 0.13$ dollars. Total, constant $K + 47{,}440$ dollars + 70,244 tons of coal.

The difference in production costs of these plants with pulverized fuel, for various coal prices, is given in the following table, which shows these costs above constant $K$:

| Price of Coal | \$1 | \$2 | \$3 | \$4 | \$5 | \$6 | \$7 |
|---|---|---|---|---|---|---|---|
| Case I..... | 99,050 | 177,110 | 255,170 | 333,230 | 411,290 | 489,350 | 567,410 |
| Case II..... | 108,407 | 181,334 | 254,261 | 327,188 | 400,115 | 473,044 | 545,969 |
| Case III..... | 109,197 | 180,994 | 252,791 | 324,588 | 396,385 | 468,182 | 539,980 |
| Case IV..... | 117,684 | 187,928 | 258.172 | 328,416 | 398,660 | 468,904 | 539,148 |

The difference in production costs between stoker-fired and pulverized coal-fired boilers, with various coal prices for each of the four cases, is shown in graphical form in Fig. 6.

These calculations, fitted to a medium-sized station, show in a general way whether or not it is economical to install costly equipment for the sake of increasing the over-all plant efficiency, and the following conclusions may be drawn from them:

1. The use of high-pressure high-temperature steam will show large returns on the investment unless the load on the plant is extremely low or the fuel very cheap.

2. It is not advisable to install air preheaters or economizers unless the price of coal is in excess of \$2.50 per ton when the plant has a capacity factor of 50 per cent, or unless the price of coal is more than \$4 per ton with a capacity factor of 25 per cent. The installation of economizers and air preheaters does not seem to be warranted with the price of coal below \$6 per ton at 50 per cent capacity factor or below \$9 per ton at 25 per cent capacity factor. Of course, it may become necessary to install air preheaters to assist combustion, as experience has shown that certain coals can be burned more successfully if preheated air is used.

3. With a saving of 3 per cent in the fuel bill, it is not economical to install the bin-type pulverized-coal equipment unless the price of coal is about \$9 per ton.

As mentioned before, each power plant should be designed to suit the conditions at which it must be operated, the load it has to carry and the fuel available. The latter quite often determines the type of combustion apparatus that must be installed.

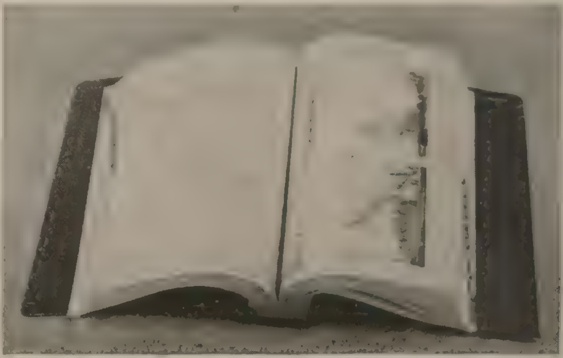
Many coals that are not suited for stoker firing can be successfully burned in pulverized form. The unit type pulverized-coal system has not been included in these comparisons. The results obtained with present installations show that efficiencies, operating costs and investment charges are very nearly the same as for stoker installation, except in cases of unusual coal conditions. The choice between stokers and unit pulverizers is, therefore, mostly determined by the fuel to be used.

Water-cooled furnace walls permit of operating with higher $CO_2$ and tend to reduce maintenance costs on walls and stokers. They also permit operating the boilers at high ratings and thereby reduce the number of boilers required for peak load operation. It is the latter faculty that chiefly determines the economic value of the water-cooled walls.

## Property Data Book Aids Operating Staff

THE use of a property data book listing all generating and substation equipment on the system of the Southern California Edison Company has been found to be of great value, particularly to the operating organization. The book is of standard 8½x11-in. size, bound in a loose-leaf leather binder and contains about 450 pages of maps, diagrams, pictures and tabulations printed on heavy white glazed stock, thumb-indexed.

The system used in compiling the book was to divide the material into three general classes; a map section, with a key map dividing the territory served into 31 sections, and individual maps of each section, showing power plants, substations and consumers' substations; a miscellaneous section, giving the symbols used throughout the book, typical schematic drawings of switch racks and elevations, and plans of substations for the standard distribution voltages used; and an alphabetical section, comprising non-tenths of the book, which contains exterior and interior views of each station or substation, a map of the property belonging to the company at the point, a colored single-line wiring diagram of the station and a list of the electrical equipment. In all, 208 stations and substations are covered in this manner.



PROPERTY DATA BOOK OFFERS COMPLETE SYSTEM RECORD

A department was created within the engineering department to compile the data book and to keep it up to date.

# Decreasing Radio Congestion

Single side-band transmission offered as a means of increasing number of transmitting stations without interference augmentation. Transmitting filters involved in plan following proved principles

By R. D. Duncan, Jr.
*Chief Engineer Wired Radio, Inc.*

MAINLY as an extension of the engineering development of wired radio broadcasting, the possibilities of side-band suppression, both at the transmitter and at the receiver, and the utilization of the carrier frequency and only one side band, in the range of frequencies employed in space radio broadcasting, have been investigated both theoretically and experimentally. The results confirm those obtained at the lower wired radio frequencies and indicate that by introducing changes in at least some of the existing space radio transmitting apparatus the frequency displacement between transmitting stations may be reduced from what it now is. The recommendations given herein are not put forth as a cure-all for present broadcasting ills. Instead, they are suggestions of a means which experiment has demonstrated to be of great practical value at the lower frequencies, both in broadcasting and in the general field of carrier communication, for partially alleviating the present state of frequency congestion. Filter circuits for side-band suppression have been used for several years in long-distance carrier-current telephony. In accordance with published reports they are also employed in the transatlantic radio telephone link. Space radio broadcasting should avail itself of the advantages offered by such improvements. The object of this article is to direct attention to the advantages and possibilities which would accompany the use of single side-band (and carrier) transmission in space radio broadcasting as compared with double side-band transmission now employed.

In the system of broadcasting by wired radio over electric light and power lines, developed by Wired Radio, Inc., because of the restrictions imposed by attenuation and general power loss on the lines, and of the requirement of high quality fundamental to broadcasting, the frequencies available for transmission are restricted to the range of approximately 25 to 70 kilocycles. As the program requirements demand three distinct channels, each with the proper frequency band, the working conditions which had to be met required operating as a minimum three closely associated transmitting stations within a frequency range of 45 kilocycles, and into the same load, viz., the line system. This latter would correspond in space radio to more than one transmitter operating into the same antenna. From the receiver standpoint there could be no cross-talk between channels or beat interference between carriers.

The problem was solved by the use of carrier and single side-band transmission in combination with master oscillator-driven transmitters. The former restricted the frequency range of each channel and the latter fixed the carrier frequencies of all channels. Single side-band transmission was obtained by the use of band frequency filter circuits at both the transmitter and receiver.

There is apparently no fundamental reason why single side-band operation would not be equally effective at space radio broadcast frequencies. When it is considered that three wired radio channels are operated on the same wire system within a frequency band of approximately 45 kilocycles, whereas a frequency displacement is space radio between individual broadcast transmitters, geographically within a range of 50 miles of one another, is of the order of 50 kilocycles, the apparent advantages of such a system in the way of permitting the operation of an increased number of transmitting stations in the present frequency range are manifest.

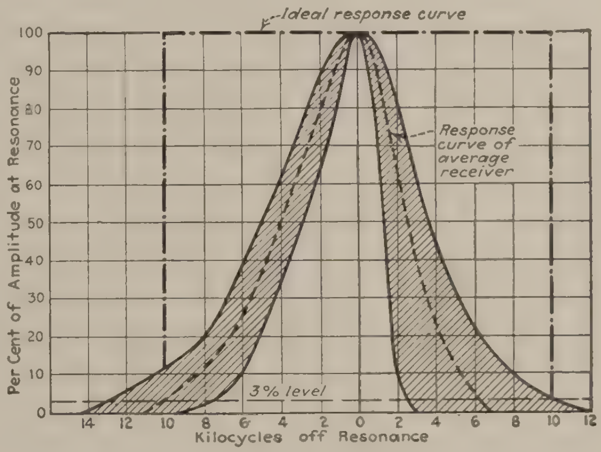


FIG. 1—FREQUENCY-RESPONSE CURVES OF BROADCAST RECEIVERS

Suggestions have been made from time to time as to the advantages of some form of synchronized or fixed frequency transmitter operation obtained by the use of harmonics of a master frequency and with the assistance of the piezo-electric crystal, for the purpose of eliminating indiscriminate fluctuation of the different transmitter carrier frequencies. Undoubtedly, improvements in this respect will be introduced regardless of the direction of other improvements or changes. Single side-band transmission, with the great advantage of conserving the frequencies required per transmitter, though known in theory and employed in other fields, for some reason has not received the use in space radio broadcasting which is merited.

The methods of single side-band transmission and reception may be better understood if a statement is made of some of the fundamental concepts of radio telephone operation when amplitude modulation is employed. These are as follows:

1. During modulation the current in the transmitting antenna consists of a series of discrete frequencies which normally extend above and below the carrier frequency; the latter is the only frequency present when not modulating.

2. The frequencies lower than the carrier are known as the lower side-band and those higher as the upper side-band frequencies. The frequency extent of the upper and the lower side bands is determined, among other factors, by the upper audio frequency limit of the modulating source.

3. The amplitudes of the side-band currents are determined principally by the degree of modulation and the impedance of the transmitting antenna at the particular frequency. Their maximum possible value with 100 per cent modulation is 50 per cent of that of the carrier frequency. Under operating conditions the average modulation is considerably less than 100 per cent and the side-band currents are correspondingly reduced in amplitude.

4. If the transmitting antenna is too sharply tuned; that is, if its impedance at the side-band frequencies is considerably greater than its resistance effective at the carrier frequency, the extreme upper and lower side-band frequency currents will be greatly reduced in amplitude, if not entirely suppressed. This is equivalent to the condition of absence of the higher audio frequency currents in the modulating source.

5. For perfect musical reproduction it is commonly accepted that an audible frequency range up to 10,000 cycles per second is required.

6. As a result of a wave impinging upon the receiving antenna or loop, a series of voltages corresponding to the carrier and different side-band frequencies is impressed upon the grid of the detector tube. The relative amplitudes of these voltages are determined by the frequency responsive qualities of the radio frequency amplifying circuits of the receiver.

7. By virtue of the rectifying action of the detector the interaction of the carrier frequency and each side frequency of the upper and lower bands produces a desired audible frequency current component in the detector output circuit. The pairs of component currents which have the same frequency add directly in their effect upon the audio frequency amplifier. One of the pairs, however, may be suppressed without affecting the quality of the audio response.

8. The suppression of one of the side bands at either the transmitter or receiver, or at both, will eliminate one of the pairs of audio frequency current components referred to in paragraph 7.

9. The presence of a second carrier frequency voltage at the detector input will interact with the first carrier and with its side-band frequencies to produce additional lower beat frequency components. The latter will be audible, providing that the difference frequency between the second carrier and the different components in the original frequency band is audible and is sufficiently amplified by the audio frequency amplifier of the receiver.

10. If the second carrier is itself modulated, still lower frequency components are produced in the detector output which further complicate reception.

11. The relative intensities of the two carrier frequency voltages, with their side bands, at the detector input are determined by the frequency responsive properties of the receiver and the field strengths of the two carriers at the receiving antenna.

From this brief analysis it is seen that the allocation of transmitting frequencies is governed, first, by the requirement of no audible beating between carrier frequencies, and, second, to a large extent, by the frequency-selectivity properties of the receiver. Since only the carrier and one side band are required at the receiver (of present types) for faithful reproduction, it is obvious that if one set of side bands of each transmitter were suppressed the frequency displacement between transmitting stations could be decreased from what it now is. The limit imposed in approaching the frequency bands of two transmitters to the point where the side-band frequencies or the carriers of the two stations produce audible beating is the frequency responsive properties of the average receiver.

Typical frequency response curves for a number of standard types of broadcast receivers are given in Fig. 1. These include single-control tuned radio-frequency amplifier sets, with and without the neutrodyne feature, the super-heterodyne type of receiver and sets with both battery and alternating-current source of tube power. The ordinates represent the ratio of voltage developed at the detector grid to the voltage applied at the input of the receiver, as a per cent of the maximum occurring at the frequency for which the set is tuned; the abscissas are kilocycles off the resonant frequency, which in this case was approximately 610 kilocycles. The shaded area in which all the curves lie accounts for the difference between sets, the dissymmetry in response for frequencies higher and lower than the resonant frequency, and for different conditions of signal volume gain for a given set. The ideal response curve for 10 kilocycles above and below the resonant frequency is shown in heavy line. The departure of the average receiver within its band pass range, from the ideal flat top response, is to be noted and would indicate a suppression of the higher audio frequencies.

Similar curves are obtained as the resonant frequency is increased, becoming considerably broader, however. At the very high frequencies the top may extend over 50 kilocycles. The latter condition leads to cross-talk interference and is a fault of some of the present types of receivers.

### Experiments Indicate Applicability of Plan

By experiment, it is known that if two transmitters produce equal field strengths at a receiving antenna, and there is to be no observable cross-talk, with the average receiver, the undesired signal voltage at the detector input must not exceed from 1 per cent to 5 per cent of the desired signal. Adopting 3 per cent as an average, it is seen from the accompanying illustration that with the worst possible conditions the frequency band of the receiver is approximately 25 kilocycles. The average receiver, shown in dashed line, gives a minimum 3 per cent response over a band of 17 kilocycles.

The present frequency displacement between transmitters in the New York City area in the range 610 to 760 kilocycles is shown graphically in Fig. 2a, for double side-band transmission, and assuming a side band extent of 10 kilocycles. Four transmitters are shown. The positions occupied by receivers of 30 and 20 kilocycle bands are also shown. In Figs 2b and c are shown two possible frequency arrangements with single side-band suppression at the transmitter. In the former all carriers are displaced 30 kilocycles and the upper side bands are suppressed. In the latter the carriers are alternately displaced 20 and 40 kilocycles and in alternate transmitters the upper and lower side bands are suppressed. The positions of receivers for the two conditions indicate that there will be no inter-transmitter interference. The arrangement of Fig. 2b and c permits of a 50 per cent increase in the number of transmitters in the same frequency range, with 10 kilocycles to spare.

By incorporating corresponding changes in the receivers; that is, by improving their frequency cut-off properties without, however, sharpening their response within the band pass range which may be accomplished by means of filters, a still closer grouping of transmitters is possible. The arrangement of Fig. 2d shows an alternate 15- and 30-kilocycle displacement between carriers and an alternate suppression of upper and lower side bands at the transmitters with receivers with a 14-kilocycle response. The transmitting stations in the same frequency range are double those in Fig. 2a.

Transmission and utilization of the carrier and only one side band is accomplished by means of band frequency filter circuits at the transmitter, or at both the transmitter and receiver. Considerable success has been had in the use of the coupled circuit type of filter,* as distinct from the so-called ladder type, for both low and high frequencies.

Several questions arise at this point. Is it practically possible to obtain the necessary cut-off required for side-band suppression with filters which are to be employed at the transmitter? Are they elaborate and costly and how would they be installed? May filters be employed over the entire frequency range now used in broadcasting? Is it practically possible to operate carrier frequencies at intervals of the order of 15 kilocycles with the exactitude which would be demanded by such a system?

### TRANSMITTING FILTERS ESSENTIAL

Transmitting filters have been constructed and operated at frequencies in the neighborhood of 610 kilocycles which have a 90 per cent amplitude cut-off with a 0.25 per cent change in frequency. Such a cut-off will give satisfactory single side-band operation. Filters of improved design are under construction with which a much sharper cut-off is expected. The filters need not be complex or costly. A desirable method of installation, where high powers are involved, appears to be that popularly known as the master oscillator-power amplifier system, wherein the unmodulated master frequency is supplied to an intermediate power amplifier where it is modulated by the audio frequencies. The output of this amplifier is fed into the transmitting filter where one side band is suppressed and the carrier and remaining side band supplied to the final power amplifier, which operates into the transmitting antenna. For the lower power stations the transmitting filter could be operated between the oscillator-modulator and the antenna.

It is not possible at the present writing to state definitely the frequency limit with which practical filter operation appears possible. As the frequency is increased the design of the filter has to be made with greater precision and more care is required in its construction and operation. There is apparently no reason, however, why satisfactory filter operation would not be obtained for frequencies of the order of 1,000 kilocycles. By throwing open the frequency range lower than 500 kilocycles for broadcasting the full benefit of filter circuit operation could be realized.

A 15-kilocycle or similar order master frequency could be generated and harmonics thereof supplied to the different transmitters within the same area. Theoretical consideration indicates that as long as the distances between the master generator of the harmonic-operated transmitters are not great, difficulties due to difference in phase and phase shift may not be expected. The supply of master frequencies to the different communities could well be a governmental function.

Successful multi-channel wired radio broadcasting has been obtained with comparatively simple terminal equipment, with a 17-kilocycle displacement between carriers and by means of single side-band transmission. Filters were employed in both the transmitting and receiving apparatus.

The close operation in frequency of transmitters was a fundamental problem in wired radio broadcasting and it was solved by considering the transmitting and receiving apparatus as parts of the same system, not as two entirely separate elements, and the entire system developed as a whole. The same course could be followed to advantage in space radio broadcasting. In the latter the vast number of receiving sets of different types and characteristics that are in use impose a limit upon what changes may be made. With the present receivers it appears that with certain changes in existing transmitters the frequency separation between stations geographically close to each other may be considerably lessened from what it now is. For example, if the frequency system of Figs. 2c and d were put in operation in the New York area similar changes could be made with stations on the Pacific Coast which occupy approximately the same frequency range. By systematically developing such a system and introducing such changes throughout the country, a relatively large number of frequency bands could be freed and room thereby made for additional broadcasting stations.

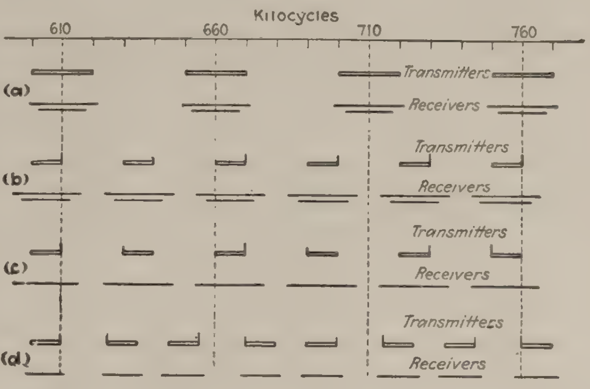

FIG. 2—SIDE-BAND WAVE SUPPRESSION WOULD DOUBLE AVAILABLE RADIO TRANSMITTING WAVE LENGTHS

The next logical step is an improvement in the receiver with a view to sharpening the frequency cut-off and flattening the response in the band pass range. Such changes will permit an additional closing of the frequency gap between transmitters. By the use of filter circuits of comparatively simple and inexpensive types, a receiver response varying less than 4 per cent over a band of 12 kilocycles and having a 90 per cent amplitude cut-off for a 0.65 per cent change in frequency in the neighborhood of 610 kilocycles has been developed for this purpose.

The present article is preliminary in character. At its writing, the first results of tests on apparatus indicate that a frequency separation of 15 kilocycles between carriers in the neighborhood of 660 kilocycles is possible with transmitters and receivers designed and constructed in accordance with the principles herein outlined, and at the most a separation of 30 kilocycles with the receiving sets at present in use. With comparatively slight improvements in the receivers a 25- or even a 20-kilocycle difference between transmitter carriers should be possible. It is hoped to discuss the system more in detail at some future date. The preliminary test results obtained, however, held such promise that in view of the present conditions in radio broadcasting it was considered advisable to make them public.

---

*The mathematical theory of such circuits has been given by L. Cohen, *Journal of the Franklin Institute*, page 641, May, 1923.

# Motor Starting Current vs. Lighting Flicker

By H. L. Wallau

*Electrical Engineer Cleveland Electric Illuminating Co.*

WITH the increased use of combined light and power underground low-voltage networks, the question of the maximum draught of current which may be allowed to be suddenly imposed upon any portion of such a system is being given greater consideration. The value of this current draught is dependent upon the constants of the transformers and mains installed, the location of the equipment producing it with reference to the supply points, the power factor of the load so drawn, and, finally, the maximum voltage drop, due to such load, which will not result in objectionable flicker of the lights.

In determining limits, the location at which the maximum disturbance will be caused must be chosen. For one-way feed, this will be at the extremity of the main; for two-way feed mid-way between transformers, assuming all transformers and mains to be of the same sizes and characteristics. It has been experimentally determined that a 2-volt flicker is the maximum allowable in the lighting voltage.

Assume a three-phase, four-wire secondary. Consider first a one-way feed. Let the transformer and mains have constants as follows, expressed in ohms:

| | Resistance | Reactance |
|---|---|---|
| Transformer ........................ | Rt | Xt |
| Phase Wire ........................ | Rp | Xp |
| Neutral Wire ........................ | Rn | Xn |

For a single-phase motor operating between phase and neutral, let the sum of the resistance and reactance to the end of the main be expressed as $R = Rt + Rp + Rn$ and $X = Xt + Xp + Xn$ ohms. The power factor of the starting current of induction motors will vary somewhat, but 15 per cent is a fair average value. The regulation in volts may be approximately expressed by the formula:

$$\text{Volts Reg.} = IR\cos\phi + IX\sin\phi + \frac{(IX\cos\phi - IR\sin\phi)^2}{200},$$

in which $\cos\phi$. is the power factor at starting. This voltage drop is to be limited to two volts. The value of $I$ determined from the above formula corresponds to the locked rotor value of the motor current.

For single-phase motors operated across two-phase wires, $R$ and $X$ should be expressed as $2Rt \div 2\,Rp$ and $2Xt \div 2Xp$ respectively and the voltage drop allowable taken as $2\sqrt{3}$ volts.

For three-phase motors, $R$ and $X$ should be taken as $Rt \div Rp$ and $Xt \div Xp$ respectively, and the voltage drop as two volts. In most cases, at these low values of power factor, the right hand term of the equation becomes very small and the following expression may be used as a first approximation:

Volts Reg. $= IR\cos\phi + IX\sin\phi$. For loads of unity power factor, the formula simplifies to

$$\text{Volt Reg.} = IR + \frac{(IX)^2}{200},$$

but the last term may not be neglected.

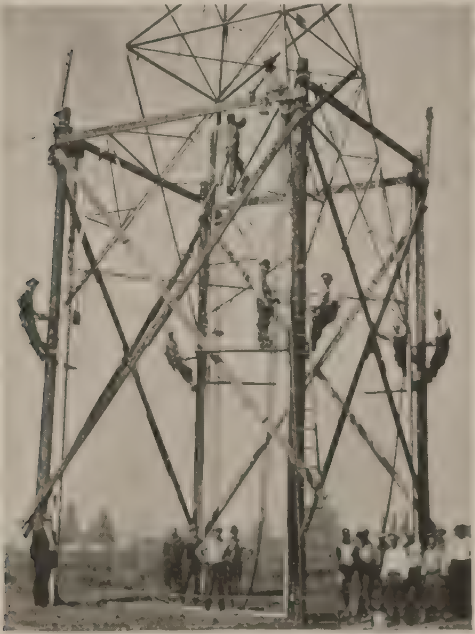
For two-way feed, the limiting values of current as determined above should be doubled since each transformer will feed one-half of the load to a motor located mid-way between the two.

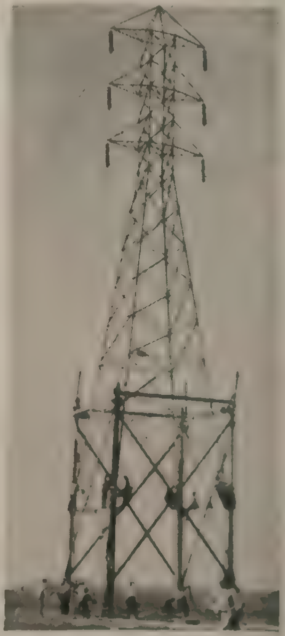
From the values of current so obtained, the allowable ratings of motors of different types may be determined.

---

# Transmission Tower Raised in 30 Minutes

VERY often it is necessary to increase the height of transmission line towers on account of road or property improvements. In such cases the Los Angeles Gas & Electric Corporation raises the tower bodily with the line hot in the manner indicated in the accompanying illustrations. Four guyed gin poles are set at the four corners of the tower and five-ton chain blocks are used to lift the tower to the desired height, after which the steel tower extension is erected. In this manner an 80- to 100-ft. steel tower carrying a 130,000-volt line can be raised 20 ft. in 30 minutes.





# Comparison of Range Elements*

### Efficiency and performance of open and closed units determined by experiments with several types and under various conditions of service

By G. J. Mickler
*Sales Department Hydro-Electric Power Commission of Ontario*

An increasing desire for accurate information as to the relative merits of the more important elements with which ranges are equipped today led to the decision to select an element of each type, of the capacity generally regarded as the principal element on a range, to subject each to a heat run test and with the aid of electrical and thermal instruments to record the performance of each and picture the comparative records by graphic illustrations. The purpose of the tests was to illustrate the comparative efficiency and performance of open and closed elements and to give to those engaged in the sale and demonstration of electric ranges some material that would enable them to convince prospective customers of the ability of electric range elements to perform efficiently and economically the service for which they were intended.

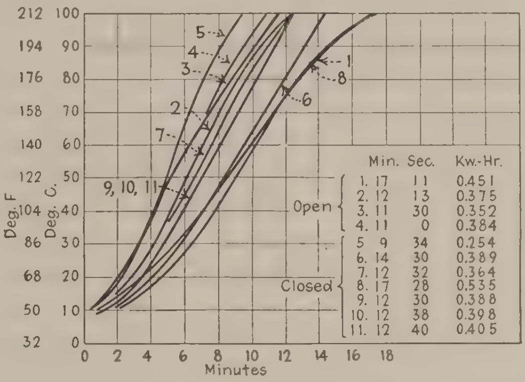
## Testing Equipment and Procedure

The set-up for the test consisted of a standard voltmeter, a standard ammeter, a resistance for voltage regulation, a standard Centigrade thermometer with an adjustable stand to permit the thermometer being raised or lowered at will, a hot plate frame equipped with a three-heat switch, an 8½-in. copper tea kettle and a standard Imperial quart measure as well as a 110-220-volt circuit regulated to maintain 115 volts with the element switch on high.

Tests were conducted on four so-called open elements, consisting of Nichrome coils laced through porcelain grooved blocks, each being of a distinct type—distinct because each manufacturer, in order to circumvent the patents of the others, is generally forced to adopt a design of his own. Investigations were also made of seven so-called protected elements—that is, the elements or heating coils which are protected either by a covering or tubing, or by a metal plate to relieve them of outside abuse. All of these elements were the products of reliable Canadian electric range manufacturers.

In this investigation one element was tested at a time using the following procedure: An Imperial quart of tap water was placed in the 8½-in. copper kettle, temperature of the water being usually 9 deg. C., and with the element cold—that is, at room temperature—the current switch was turned to high heat, the voltage adjusted to 115 volts, and the thermometer lowered to within about ¼ in. of the bottom of the kettle. Readings were taken of the temperature of the water at 1-min. intervals until the boiling point was reached.

When the water had been brought to a boil, the current was turned off and the element allowed to cool, usually over noon hour or over night, after which two quarts of water was placed in the kettle at 9 deg. C., and the operation was repeated, taking readings of the thermometer at 1-min. intervals until the boiling point was reached. In a similar manner, after the element was cooled again, three quarts of water was placed in the kettle at 9 deg. C., the current turned on and readings taken every minute up to the boiling point.



TIME REQUIRED TO BOIL ONE QUART OF WATER FROM COLD START

The performance of each of the eleven elements is indicated. The graph shows that closed element No. 5 boiled one quart of water in 9 min. 34 sec., with a consumption of 0.254 kw.-hr. Three open elements required 11 min., 11 min. 30 sec. and 12 min. 13 sec. respectively. The performance of open element No. 2 and closed elements Nos. 7, 9, 10 and 11 was practically the same. Element No. 4 consumed 0.384 kw-.hr., considerably more than that of some of the other elements. This one was very much overrated, offering a probable reason as to why it performed a little better than some of the others.

After this third test the element was considered a hot element—that is, about as hot as it would become in ordinary domestic service, provided it is not left on high heat without a utensil on top of it. Another series of tests was then carried on with this hot element, putting one quart of water at 9 deg. C. into the kettle, which had been previously cooled off. With the current in the element at high, temperature readings were taken of this quart until the boiling point was reached. In a

TIME REQUIRED TO BOIL THREE QUARTS OF WATER FROM COLD START

Element No. 5 arrived at the boiling point first. This graph gives another comparison between No. 2 and No. 7, the latter being one full minute ahead of No. 2, or roughly 5 per cent faster.

similar way two quarts of cold water and three quarts of cold water were brought to the boil on the hot element.

Upon the completion of this test, in order to find out the amount of residual heat in the elements after the current is turned off, three quarts of cold water was placed in the kettle, which was then placed on the hot element and the current turned off, and temperature readings taken every minute up to the point where there was no further rise in the temperature of the water. In the preceding tests the lid of the kettle was open to permit reading the thermometer at the lower temperature.

Another test was made to determine how long the boiling operation would continue after the current was turned off under three quarts of water which had been brought to the boil previously. In this case readings of the thermometer were taken until the temperature had dropped below 99 deg. C. In this case the lid of the kettle was closed and the thermometer inserted through an opening.

An additional determination was made on closed elements with a metal plate covering to show the effect of improving the contact between the surface of the element and the bottom of the kettle by pouring water on the cold element and also by pouring mercury on the cold element and comparing the results obtained when boiling one, two and three quarts of water on an initially cold element. The results were plotted, curves being drawn and calculations made to show the time required by each element to perform each function and the number of kilowatt-hours of energy expended. The graphs for the heating from a cold start indicate that some of the closed elements take a somewhat longer time to get started, whereas the open elements show a much more rapid temperature rise, since the coils are more or less free to exert their energy upon the kettle as soon as the current is turned on. One interesting point that it might be well to note is that No. 2 (open) and No. 7 (closed) elements, which are of practically the same rating, require the same time to reach the boiling point. These elements are manufactured by the same company and afford an interesting comparison of the speed of open and closed elements.

TIME REQUIRED TO BOIL ONE QUART OF WATER FROM HOT START

In this case the three closed elements are first followed by No. 4, the high-capacity element. It will be seen that No. 5, which was in front in the cold tests, is now pretty well to the back.

It might be well to explain that the reason No. 8 element shows such a poor performance is that with a kettle the bottom of which is perfectly flat and with an element that is not perfectly flat, the contact between the two not covering a very large area, the radiation from the element to the kettle and into the water constitutes a very slow process. Apparently the air space between the element and the kettle, and the possibility of circulation of air carrying off the heat, slowed up the operation very materially.

When plotting these curves it was found that elements with a cast-iron cover absorb a little more heat and give it off a little more readily than do open porcelain elements. On the graph for the temperature rise of three quarts of water on a hot element the temperature rise of one of the cast-iron elements is shown as 63 deg. C., or about 140 deg. F. The other cast-iron elements are somewhat lower and not very far away from a porcelain element, which brought water up to 122 deg. F. This may answer some of the arguments about the absorptive power of porcelain as compared with cast iron. The general opinion is that porcelain does not absorb heat and all the heat generated by the heating coils passes through the air into the kettle and into the water, whereas cast-iron elements take up and hold a lot of the heat given off by the heating coils. It is true they absorb a lot of heat, but they give it off very rapidly, once they get hot. Porcelain is slow to absorb the heat, and it is just as slow to give it off, although these curves show that the amount of heat absorbed by the porcelain may be almost as much as that absorbed by the cast iron in some cases. This depends, of course, on the amount of porcelain and the amount of insulation beneath it.

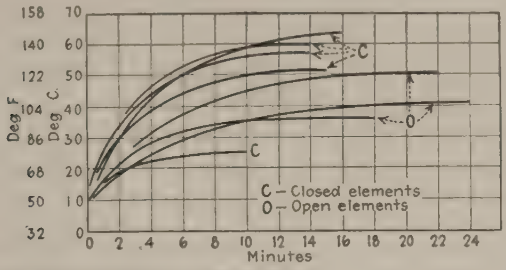
TIME REQUIRED TO BOIL THREE QUARTS OF WATER FROM HOT START

Closed element No. 10 is in the front, followed by Nos. 4, 11, 8, 9, 7 and 6. This series of tests on hot elements shows beyond a doubt that closed elements are considerably faster than open elements, due to their giving off evenly the heat stored in the element in the first part of the operation of bringing water to a boil. This is further illustrated by a comparison of the kilowatt-hour consumption, which shows that with two exceptions the kilowatt-hour consumption by closed elements is less than that of the open elements.

The same thing is true of the amount of heat absorbed by cast-iron plates.

The interesting feature of this subject is not that porcelain will absorb as much heat as cast iron but the demonstration of the value of the heat that is stored in an element and that in many cases is lost if economical operation of a range is not carefully studied. If it is desired to utilize all the heat that is given off by a range element, either open or closed, after certain boiling operations have been completed, and there are many times when it is just desired to bring water to a boil, the residual heat in an element should be made use of. That is to say, supposing the kettle to have been brought to the boil for making tea. When sufficient water has been drawn off the kettle for the tea, it should be filled up with cold water, and this kettle full of water placed on the hot element. These curves show that in about the time that it takes to eat a meal there will be enough hot water to wash the dishes in the average home. If you put warm water in the kettle of course the temperature would be much higher at the finish than it is when you put cold water on, but with cold water at the start, the temperature rise to from 122 to 150 deg. F. is as much as any one requires for dish-washing purposes.



TEMPERATURE RISE OF THREE QUARTS OF COLD WATER ON HOT ELEMENTS

The extent to which different types of elements store up heat when the current is turned on was indicated by placing three quarts of water over a hot one, turning the current off and observing the temperature rise of the water until a maximum was reached.

The table on page 199 gives the consumption of each of the individual elements used in the foregoing experiments. These figures give a fair comparison between the elements, as the duties performed can be considered diversified.

## New Voltage Standardization Booklet

BASED on a recent survey of electric voltages, a booklet has just been published by the voltage standardization sub-committee of the lamp committee of the National Electric Light Association, showing the lighting voltages in nearly 19,000 communities in this country. This is the first reissue of a similar booklet published in 1923; comparison with the latter shows considerable progress in voltage standardization toward the objective recommended by the lamp committee in 1923—that "the recommended standard practice be the selection of such a service lamp voltage as will supply the proper average voltage to 115-volt lamps," with 110-volt systems and existing 120-volt systems as recognized departures.

In the five years between the publications of 1923 and 1928, the number of communities having 115-volt service only advanced from 35.6 to 68.2 per cent of the total, while the 120-volt communities have increased only from 8.2 to 11.1 per cent and those served at 110 volts have decreased from 47.7 to 19.9 per cent. The total served at one of the standard voltages has increased from 91.5 to 99.2 per cent in number, or from 95.2 to 99.7 per cent when those using more than one voltage, but all standard, are included. Also, there has been a gain of 8 per cent in the total number and 11 per cent in the total population of the communities having only one single-standard lighting voltage reported for the entire city.

In the new publication, the old data were completely ignored and a fresh start was made; 3,517 towns of the earlier list, regarding which no information was received, were dropped, but 7,746 new ones were added. As the total population of the towns listed in both issues is approximately the same, it is evident that the new towns are relatively small.

Returns show frequent cases of small plants, and particularly municipal plants, having been sold or changing their source of supply to purchased energy, and indicate a general tendency toward the supply from larger, and therefore more economical, generating stations.

In the listing, the number of towns served by municipal plants has decreased from 1,732 to 1,200 and the populations so served from 4,347,500 to 3,351,300. There has thus been no notable change in the average size of towns served by municipal plants. It is noted that these plants are lagging in the nation-wide movement from 110 volts toward the central standard of 115 volts.

## Ground Return for Series Street Lighting

By J. A. Cook

*Superintendent Electrical Department Lynn (Mass.) Gas & Electric Company*

GROUND return for series street-lighting circuits is being successfully used by the Lynn Company in its recent extension of "White Way" lighting. One conductor per circuit is saved in the underground cable system. Two-wire service is continued in overhead territory, because the investment saving there would be very small and tree conditions make overhead wire return desirable.

The lighting units on the extension involve 2,500, 10,000 and 15,000-lumen incandescent lamps supplied by 20-kw., type "R.O." General Electric constant-current transformers mounted on poles on side streets adjacent to the underground district. A cable fault can readily be located, since the lamp immediately beyond the fault will be dim or out, and the lamp just before the fault will burn at full brilliancy. Each of the transformers has a control switch with operating solenoid connected in one of the existing street-lighting circuits leading to the station. A maximum of two transformers is connected per station circuit. When the operator energizes the outgoing street-lighting circuits the transformers are switched upon the commercial light and power 2,300-volt circuits at various points. This increment of street lighting service is, accordingly, obtained at low investment cost and entails the maintenance of only a short additional length of underground cable.

A more important use of the ground return is for the ornamental luminous arc lamps on main business thoroughfares. Ground return reduces the investment for these units, which is otherwise particularly heavy, since the arc lamps require uni-directional current of high voltage supplied by constant-current mercury-arc rec-

THREE-WIRE CONNECTION AND GROUND RETURN FROM ADJACENT SERIES CIRCUIT TERMINALS

tifiers installed in an attended station and frequently there is a long distance between the last lamp on the circuit and the station. The Lynn company uses 75-light General Electric rectifiers, each of which serves its load over a single No. 6 A.W.G. cable. At the last lamp on the circuit a solid connection is made to the cable sheath and also to a nearby water pipe. One side of the rectifier unit is similarly connected to ground. This system has been in satisfactory operation for about two years. Six units are in service with ground return.

Measurement of resistance of ground return on a typical Lynn circuit by voltmeter method shows the ground resistance to be only 0.71 ohm. The airline distance from the grounding point to the station is 6,000 ft. This length of No. 6 A.W.G. copper wire has a resistance of 2.4 ohms.

When these rectifier sets were first put in service, a certain amount of operating trouble was experienced on account of the higher voltage to ground sustained by the first ten lamps in each circuit nearest the station. In the usual wire-return circuit the point of ground potential is approximately midway in the circuits of lamps, and, accordingly, the maximum voltage-stress to ground corresponds to half the total circuit voltage. Circuits operated with ground return have low voltage to ground on lamps near the grounded terminal and full voltage on the other end.

Initial operation of these circuits demonstrated that the lamps, insulators and cutouts manufactured for two-wire circuits would not give satisfactory service on ground return circuits under Lynn conditions. In those cases known to the author, where ground return is used by other companies, street lighting standards had wooden shafts supporting the lamps. Such shafts contribute materially to the circuit insulation. The Lynn system uses King all-metal standards, which are solidly grounded to the cable sheathes and the water-pipe system, so that the full voltage to ground is impressed across the lamp insulator at the top of the standard. The General Electric Company increased the thickness of the lamp insulator by nearly one inch and provided absolute cutouts with a larger amount of surface insulation than was previously standard. The operating results compare favorably with those obtained by two-wire return.

The telephone company's representatives investigated to determine whether or not return of street light current through the ground produced objectionable inductive effects in telephone circuits. They found no disturbance and gave the installation their approval.

It is interesting to note that, where two circuits can be made to terminate adjacent to each other, the ground connection can be made on the negative side of one circuit and on the positive side of the other. Accordingly, the ground current is confined to the short distance separating the grounded lamps of the two circuits. The Lynn company did not install the system in this way, but it seems to be possible of successful application where soil has high resistance or where inductive effects may be detrimental.

## Brazilian Generating Station Inspires Rudyard Kipling

RUDYARD KIPLING visited an electric power house near Santos, Brazil, on a recent trip to South America, where he inspected a generator which, according to the eminent English poet and story writer, "spins upon the largest bearings in the world." It served as an inspiration for a two-stanza poem which is published for the first time in America in the current issue of the weekly magazine *Liberty* and is as follows:

Song of the Dynamo

How do I know what Order brings
  Me into being?
I only know, if you do certain things,
  I must become your Hearing and your Seeing;
Also your Strength, to make great wheels go round,
And save your sons from toil, while I am bound!

What do I care how you dispose
  The Powers that move me?
I only know that I am one with those
  True Powers which rend the firmament above me,
And, harrying earth, would save me at the last—
But that your coward foresight holds me fast!

(Copyright, 1927, by Rudyard Kipling in the U. S. A.)

## Factors Affecting Accumulation of

# Depreciation Reserve

Life dependent upon definition of unit. Accounting for removal costs. Annuities for special short life installations. Interdependence of plant items with respect to life

By W. G. Cross

*Assistant Valuation Engineer Southern California Edison Company, Los Angeles, Cal.*

IMPORTANCE of the definition to be used when considering depreciation or any of its phases has been stressed previously in this series of articles. As has been noted, depreciation may relate to price, thus producing lessened market value; to serviceability, thus assuming a less efficient article of use; to physical structure, with a resultant weakened structure from the service angle or a structure containing less physical material and thus a lessened wearing life; and in a very great variance of ways to functional use, indicating decreased present value or lessened future life.

Not all replacement, repair, etc., caused by a wearing-out process may normally be considered depreciation from an accounting point of view, or even from the point of view of an engineer. The replacement of bearings in rotating apparatus is almost universally considered an operating expense or, at least, a type of expense which is not the fundamental wearing out of the item. Reference has already been made to the question of definition of the smallest unit to be used in accounting for depreciation, pointing out that a complete unit, ordinarily renewed by repairs, etc., may have a life much in excess of the individual parts which comprise such a unit. If the individual parts themselves were considered the unit, the life, or service value, would almost universally be less than that of the more inclusive unit and would require entirely different treatment.

Moreover, the practice of a utility or the regulating commission supervising the utility, may decide that, for accounting purposes, certain costs shall be considered operating expenses rather than expenses to be taken care of through a depreciation reserve. While it is customary to charge the costs incidental to the retirement of most items against the depreciation reserve, in the state of California it is specifically provided that the removal of meters and services, during the life of the item, shall be considered operating expense.

While it is fully realized that there are many utilities which may not desire to take care of replacements through a depreciation reserve, all such expenditures being handled as operating expenses, the discussion in these articles is based upon the premise that the cost of retiring plant at the end of its life may cause such a disturbance, if considered a portion of the operating expenses, as seriously to change the uniform character of such expenses. Thus it is rendered very difficult to forecast yearly operations and to set rates and collect revenues in such a manner as to provide for these fluctuating expenses. With such a thought in mind, a great many utilities accumulate a fund by means of annuities in such an amount that this fund, theoretically, will always have available sufficient money to reimburse the utility for the cost of the item at the date when it ceases to function usefully. As has been noted, the minimum item, or the unit, must be positively defined, for it is not logical to provide a fund to retire a boiler at the time when that boiler shall be considered to have completely ended its life, and then inconsistently withdraw funds from the reserve, at a period much earlier than the complete retirement, to take care of the retirement of the fire-brick linings or boiler tubes comprising a portion of such boiler.

Two factors pertaining to depreciation and the accumulation of a reserve have not, so far, been noted. They are the salvage value to be obtained from a unit at its expiration of life and the cost of physically removing or retiring the item. The reserve is usually designed to take care of both, that is, to reimburse the original "wearing value" or cost of the item, less its salvage, and to provide a sum of money sufficient to pay the cost of removal.

### Salvage Value and Removal Cost

In determining the wearing value, attention must be given to salvage value at the end of life. Three methods are in common use: one assumes that the salvage will practically be offset by the removal cost; another, that the estimated life may be arbitrarily lengthened, when computing the annuity, to make allowance for net salvage; third, an attempt may be made to compute the wearing value by estimating the probable salvage. The first method is not ordinarily considered a distinct method, but is rather assumed when a utility makes no allowance for salvage or removal cost in its depreciation calculations. It is very commonly used, however. The lengthening of lives for salvage is feasible, but is a somewhat indirect method. In general, comparatively little lengthening is required to take care of net salvage obtained, if handled on a net salvage basis. The third method, which makes an attempt to compute salvage, cannot, at best, be more than a vague estimate which is subject to conditions of price, future state of the art, business conditions, new inventions and almost every other conceivable contingency. It is doubtful if such a method produces results any more accurate than either of the previous types of estimates.

With respect to the depreciation reserve taking care of removal costs, the situation becomes somewhat complicated when removals take place prior to the expiration of the ordinary life of the material in question. The reserve, as accumulated, ordinarily is designed for the purpose of taking care of one removal. If a substation transformer, for instance, is moved between substations three or four times during its life, the reserve is, in theory, not adequate to take care of the expense thus involved, and such costs would properly go against operating expenses. In theory, this is true but, in practice, it is often difficult, from an accounting point of view, to distinguish an "interim" removal from a final removal. Such determinations might be made in the case of a small utility, but in a larger utility where thousands of items are involved, such a course is not always practicable. It is, therefore, often the case that the reserve is called upon to take care of these interim replacements. Under such conditions, the one handling the depreciation accounting must carefully consider the effect of such additional expenditures, and, possibly, make provision in the annuity. It will be noted that the cost of interim removal, which is mainly a labor cost, is similar in its aspects to partial replacement of a unit such as a boiler, but the reason why interim replacements are charged against the reserve is merely to facilitate accounting. The procedure is not entirely logical.

### Short Life Installations

A problem is presented in the case of engineering design, where, in order to give proper service, units must be installed under such conditions that the life will be greatly foreshortened. If it is known, for instance, that a certain pole line, or set of pole lines, is installed for the purpose of serving an industry which will be in existence only for five years, and that the location, perhaps, is such that very little salvage can be expected at the end of that period, special note must be taken of such considerations. It is, ordinarily, not practicable to set up a special reserve for individual pieces of property of this nature, as the accounting would become so complicated that it would be too cumbersome and expensive. If, on the other hand, average lives (including all the property of the company) are shortened, or other constants modified below those customarily used in utility work, regulatory bodies and such of the public as are interested in public utility matters are likely to look with suspicion upon such procedure, and refuse recognition of any adjustment which tends to increase the depreciation annuity, and thus increase rates which are based upon the cost of service.

Such conditions, however, are sometimes precedent to good service, and it is very interesting to note that the California Commission, in a decision dated Dec. 31, 1926,* noted that the company's engineers had used somewhat shorter lives than those previously accepted, in claiming an annual allowance for depreciation, and apparently looks with approval upon the change, stating that "rapid growth of the company's load is calling for the replacement of many pieces of equipment on account of lack of capacity before they are worn out in service. To quite an extent, it is more economical to install moderate-sized equipment and replace it before it is entirely worn out than to carry the extra investment in the larger equipment to avoid such replacement." If lives are not shortened, replacement should be charged to operating expenses, or some other provision should be made.

An error frequently made is that of neglecting the life relationship which obtains between various items of equipment in a plant. A concrete dam may perhaps be considered as of almost indefinite life, but if the hydroelectric project of which it forms a part is subject to a limited tenure of life, say, 40 years, not only should the annuity to retire the structure be accumulated on the short-time basis, but, presumably, some other large accumulation may have to be made to take care of the heavy costs of physical removal of this type of structure.

Again, a concrete power plant building is ordinarily thought of as having a long life, perhaps 40 years. In the case of modern steam plants, however, such a building is little more than a set of massive foundations for the generating equipment, with walls to keep out the wind and a roof to shed rain. The steam turbine equipment resting upon the foundations which form a large part of the building may be retired at the end of twelve years. It would be unreasonable to suppose that these same foundations would be satisfactory for such new type of equipment as might later be installed. The building's usefulness ceases at the time of retirement of the equipment. The author knows of no instance where generating plant buildings, either hydraulic or steam, have ever been used for a subsequent installation of hydro or steam generating equipment after the original installation has lived its life and been retired, and it is extremely improbable that such subsequent use could be made, except at the expense of engineering efficiency. As in the case of dams, the cost of removing these foundations may be very great. Obviously, therefore, the building life is not 40 years.

### Prolonged Life By Maintenance

The prolongation of life by maintenance is a subject requiring careful attention in discussions of depreciation and determinations of estimated lives. It is quite evident that not only can an item be used beyond the time when it would ordinarily be replaced by the process of making extraordinary repairs but it is further true that many utilities are forced, by financial circumstances, to do this very thing. Under such conditions, the question arises as to whether the additional amounts thus accumulated in the reserve should be utilized for making repairs. In general this procedure may be said to be defensible only when the condition is clearly apparent.

In the case of determination of accrued depreciation, it is commonly accepted that a certain amount of "normal maintenance" may exist without being considered as existing depreciation. Such maintenance, accumulating between visits of the repair gang, is that maintenance usually taken care of through operating expenses. In the case of "deferred maintenance," however, the question is more difficult. If normal operating expenses have not been expended and the property is in a state of repair lower than that which would normally be considered reasonable by a financially solvent operating company, it is quite evident that an estimate will have to be made for such a condition in adition to the other factors commonly entering in.

Another feature of interest is one that is never shown in actual calculations when determining accrued depreciation, but is none the less there and should have a certain amount of weight. In the case of generating plants, substations and other sections of plant where co-ordinated mechanical operation is required, it is distinctly true that the first few months, and sometimes years, of operation require a greater expenditure than the succeeding years, due to the fact that difficulties have to be met and overcome and the plant has to be "broken in." In many cases a plant is in better operating condition at the expiration of the first or second year than it was at the beginning of its service. It is very difficult to make an allowance for such a condition of appreciation mathematically, and, hence, it is seldom ever done. Depreciation by inspection is able to make some allowance for this condition by offsetting the appreciation against factors of wear and tear, but it is probable that the only way mental processes ever take care of this factor is by the indirect route of assigning a "going value" to a plant in complete operation. This seems to be a crude attempt to allow for the fundamental feature, but no better way appears to be offered.

---

*_California Railroad Commission, re Los Angeles Gas & Electric Corporation, P.U.R., 1927, C-568._

The absence of definite terms of measurement for depreciation and remaining value often renders it difficult to determine the amount expressed in dollars which may exist in a property, but, if the fundamental conditions are consistently kept in mind throughout any set of estimates or calculations, a result can always be obtained based upon the particular premises involved, and it is only fair to qualify the answer with the statement that it is based upon those certain premises. Similarly, in matters connected with determination of depreciation annuities, there is but one fundamental end to be attained, and that is that the utility should be recompensed for its entire investment during the period of service in such a way that the company will remain whole when the article has ceased to function usefully.

# Reducing Distribution Losses

## SIXTH ARTICLE

## *Loss-Testing Equipment*

By J. B. Moorhouse
*Electric Distribution Engineer Central Illinois Public Service Company, Springfield, Ill.*

The field work involved in the reduction of transmission and distribution losses falls upon the shoulders of the division distribution man designated in the organization chart accompanying the first of these articles. In order that he may be prepared to make investigations completely, he must carry a number of electrical testing instruments, both indicating and graphic.

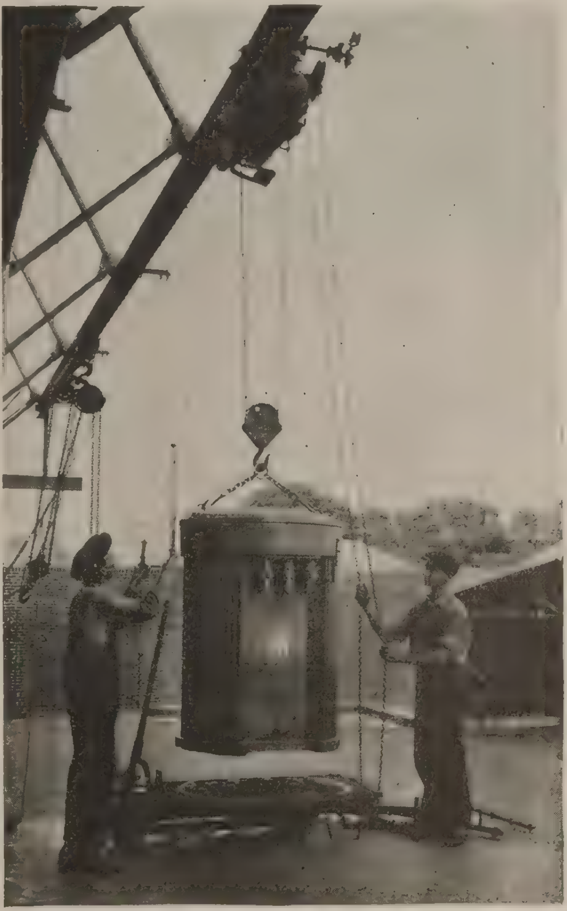
| Quantity | Article | Scale |
|---|---|---|
| 1 | Indicating ammeter | 0-5 |
| 1 | Indicating voltmeter | 0-150-300 |
| 6 | Graphic ammeters | 9-5 |
| 6 | Variable ratio current transformers | 25/50/100/200 |
| 8 | Graphic voltmeters | 90-130/180-260 |
| 2 | Potential transformers | 20:1 |
| 1 | Potential transformer | 60:1 |
| 1 | Line test set (Indicating ammeter and split core current transformer) | 0-35-125-250 |
| 2 | Ground current detectors | |
| 1 | Ground rod resistance test set | 0-40 ohms |
| 1 | Panel body truck ½ ton capacity.<br>Miscellaneous cable, rubber protection, tools, hand lines, etc. | |

A large number of instruments would require a heavy truck for transportation. This would be too slow and expensive. The few instruments which could be carried in a small car would be inadequate. To cover the situation, a ½-ton panel body truck has been used with the equipment listed in the accompanying table.

The distribution man in each operating division spends his entire time investigating losses. He is assisted by a man who takes notes used for the preparation and revision of distribution maps. The division meter man is also available when needed in checking questionable meter operation.

# Material-Handling Crane Saves Time and Labor

A 5-ton monorail electric crane installed at the distribution headquarters of the Los Angeles Gas & Electric Corporation has been found a great aid in loading and unloading distribution transformers and handling other heavy material used in overhead and underground construction work. As may be seen from the accompanying illustration, the crane has floor control for the motor for raising and lowering and chain control on the travel of the carriage. Transformers are placed on special loading skids so that the hand lift truck shown may be run under the skid and used for raising and moving the transformer about. The crane is also very useful for loading and unloading cable reels carried by trailers.



ELECTRIC CRANE LIFTING A 100-KVA. SUBWAY TRANSFORMER FOR LOADING ON TRUCK

# Electric Brooders Bring Good Revenue

### Survey shows cost of 2 cents per chick. One kilowatt-hour per chick required. Large load developed in western Washington

By J. C. Scott

*Agricultural Service Puget Sound Power & Light Company, Seattle, Wash.*

During the 1927 brooding season, from January to June, fully 1,500,000 chicks, or approximately 25 per cent of the chicks raised in western Washington, were brooded electrically. Complete data compiled by the Puget Sound Power & Light Company during the past brooding season on a number of electric brooders reveal some valuable information.

ELECTRIC UNDER-HEAT BROODER OF 1,000 CHICK CAPACITY OPENED TO SHOW INTERIOR

It was found that the average cost of electric current in the Puyallup district to bring one chick through the six-weeks brooding season was 2.1 cents. To obtain this figure 68 poultrymen, using 121 brooders of all makes, and 69,500 chicks were considered. A total of 70,675 kw.-hr. was required to brood the 69,500 chicks, or approximately 1 kw.-hr. per chick. The rate for the brooders was 4½ cents for the first 100 hours' use of the demand, and excess at 1 cent. A summary of results of the survey are given in the accompanying table.

A check of electric brooding costs in the Bellingham and Lynden (Wash.) districts showed the average cost for current to brood one chick for the entire brooding season to be 1.94 cents. This was based on 24 poultry farms and 45,400 chicks. In this instance, as in the Puyallup districts, the cost ranged from less than 1 cent to more than 3 cents to brood one chick. It required 40,173 kw.-hr. to brood 45,400 chicks, or 0.884 kw.-hr. per chick. The rate in this case also was 4½ cents for the first 100 hours' use of the demand and excess at 1 cent.

Poultrymen in western Washington have found that brooding with modern electric brooders produces better chicks and a more uniformly developed flock, reduces labor, care and attention, reduces fire hazard almost to nil and in most cases costs less than with fuel. Through its agricultural service division the Puget Sound Power & Light Company is actively developing the electric brooder load and expects 50 per cent of the 6,000,000 chicks raised in its territory during the spring of 1928 to be brooded electrically.

DATA ON ELECTRIC BROODING OF CHICKENS BASED ON 121 BROODERS AND 69,500 CHICKS

| | Max. | Min. | Average |
|---|---|---|---|
| Number of chicks per customer | 3,000 | 500 | 1,000 |
| Wattage of individual brooders | 1,200 | 500 | 750 |
| Kw.-hr. used during brooding season | 3,293 | 247 | 1,023 |
| Demand (kw.) per customer | 2.7 | 750 | 1.16 |
| Average rate paid per kw.-hr. (cents) | 3.5 | 1.45 | 2.1 |
| Customer's bill for brooding season | $62.23 | 8.89 | 21.60 |
| Number days brooding per batch of chicks | 60 | 30 | 45 |
| Kw.-hr. per chick | ...... | ...... | 1.015 |
| Cost per chick (cents) | ...... | ...... | 2.17 |

# Electrical Industrial Trucks Necessities at Grand Central Station

"Without our 50 drop-frame electrical industrial trucks," states H. A. Currie, assistant electrical engineer of the New York Central Railroad, "it would be impossible to operate the terminal and to care for even the normal amount of baggage. Hand trucks, no matter how many of them, could not possibly replace the electric baggage trucks."

Everything that is carried in a mail or baggage car is trucked from the train platforms on the electrical industrials. The mail averages 2,000 tons per day. Baggage amounted to 139,638 pieces in June of this year and 2,255 tons of newspapers were loaded. The tremendous task is accomplished quickly and well by some 50 vehicles, the majority of the drop-frame type but with five light-weight units for last-minute baggage service. The drop-frame trucks are built with platforms close to floor level, batteries being carried under one raised end and the motor under the other. Each has a capacity of 4,000 lb. The American Railway Express Company operates 42 drop-frame industrials in the same terminal.

The trucks used by the New York Central Railroad travel 115,000 miles a year, averaging 4½ miles a day apiece. A repair room is maintained in the terminal. Overhauling is done, not oftener than once in 2½ years. The battery room contains sufficient batteries to provide an extra set for half the fleet. These are kept constantly on charge, and as it requires but eight hours to impress a full charge the trucks are kept in 24-hour service by replacing the batteries in half of them at sixteen-hour intervals. Electricity for this service is supplied by the New York Edison Company.

Principles and objectives of a central-station company's sales department. Formation of lighting, power and merchandise divisions that permits flexibility

By B. J. George
*Industrial Engineer Kansas City Power & Light Company, Kansas City, Mo.*

LOAD BUILDING and new-business development have become matters of vital importance to electric light and power companies within the last few years. What scheme of organization will prove most practical in rendering advisory service to customers and in adding revenue-producing business has been much discussed among utility men, who are confronted by the fact that many existing commercial departments have expanded and grown along lines of expediency rather than upon any definite program looking to a well-balanced and efficient sales organization. Obviously no set rules can be laid down nor could one company's plan of organization be applied rigidly to some other company. Each has different requirements depending upon size, location and nature of business served. There are, however, certain principles and definite objectives in sales operations that are common to all electric utilities and that may be used as the basis for setting up a workable scheme of sales organization.

SUGGESTED BASIS FOR ORGANIZATION OF COMMERCIAL DEPARTMENT

### Public Relations Value of Department

The commercial department of a public utility occupies a peculiar position in that it is the medium of contact between the utility and its source of revenue—its customers. It thus offers a point of contact with the public that is vital to the existence of the company. It must, of necessity, be correlated with the other departments of the utility—it must work hand in hand with the engineering and construction departments, since the engineering department supplies plans and estimates for line extensions pertinent to service to new or existing customers, the plans later being executed by the construction department.

Co-operation with the operating department enables the commercial department to be ready at all times to advise customers concerning the reliability, continuity and general satisfaction of the service rendered. The bookkeeping and collection departments supply the commercial department with information as to the billing and collection records pertaining to the customers' accounts. Likewise, each of the departments throughout the company supplies essential information and service to the commercial department. In fact, the department must look to every other department for its working material with which to approach the customer. This does not place the department in a minor position, but rather its co-dependence upon the other departments is a corollary to the proposition that each of the other departments depends upon the commercial department for its volume of work. Let it fail, and the work and importance of the other departments diminish. Let the sales engineers be sluggards, and new customers appear not, while old customers vanish.

A utility commercial department may be organized in a number of ways depending upon the volume and nature of the business handled. An ideal arrangement might consist of a chief-in-charge, under whom are three superintendents of lighting, power and appliance and equipment sales. Sometimes all three are grouped under one department head. In some cases one or more of the divisions may be under a chief, separate and distinct from the chief-in-charge of the remaining divisions. It must be realized that only in exceptional cases can there be an iron-clad, separate and distinct division among the functions of the subdivisions. An organization chart is good in so far as it is not permitted to bind and prohibit efficiency.

The lighting sales and power sales divisions handle all

TYPICAL ORGANIZATION FOR LIGHTING AND POWER SALES

negotiations and contracts pertaining to their respective classes of business. The lighting sales department handles domestic lighting and house wiring. The power sales division is usually found to be more or less indistinctly divided into subdivisions pertaining to a certain class of customers, a certan class of industries or particular classes of applications of the product of the utility. The size of the company and the extent of its operations will, of course, largely determine the subdivisions. For example, ice and refrigeration industries, cement industries, apartment hotels, office buildings and theaters and industrial heating may be found in the widely ranged subdivisions. Each subdivision is delegated to one or more industrial engineers, who are to a degree specialists in their particular line and who co-operate with their fellow workers when problems interlink.

### Qualifications of the Power Salesman

The industrial engineer thus assigned to a particular class of business is enabled through attention to the articles in the technical press and attendance at conventions to keep up to the minute in his knowledge of the particular class of business assigned to him. The qualifications of a power salesman are a technical education, practical engineering training, a viewpoint of the industry, faith in himself, his company, its products and its ideals, a good address, courtesy, honesty and integrity of character and, above all, ability to judge men. In addition to the industrial engineers, there are, of course, the clerical force, stenographers and statisticians, the latter having to do more largely with the keeping of records as to demands, consumption, cost per kilowatt-hour and cost per unit output for the major customers.

REMARKS:-

LOAD FACTOR CARD FOR RECORD OF LARGE CUSTOMERS

The appliance and equipment sales division is often divided into two subdivisions, one of which handles the sale of major equipment, such as switches, transformers, substations, motors, etc.; the other the retail salesroom, usually called the "electric shop," which handles the sale of domestic appliances—this to include district or territory salesmen and supervisors who handle the company's direct sale of appliances to residence customers.

The accompanying chart shows a scheme of organization of the commercial department that permits of a definition of duties and segregation of activities into logical groups, but which maintains all commercial activity under one head. This permits close co-operation and flexibility, which will allow a temporary shifting of trained men from one division to another when the work in a division makes assistance advisable. This is not always convenient where departments are widely separated under different heads. Especially is this so when jealousy is present.

A second chart shows a plan of organization used in some cases. It differs from the first chiefly in that the domestic appliance sales department is under a separate chief; also in that the sale of heavy-duty equipment in the power sales department is handled by the individual power salesmen, whereas in the other the appliance and equipment sales division handles the sales in co-operation with the various power salesmen. The assignment of duties to power salesmen will, of course, depend largely upon the territory served. For instance, a utility in the East would have little work for a specialist on milling, but might have great need for one on textile industries.

The organization scheme should be decided upon only after careful study of conditions to be met. Once adopted, a copy of the chart should be available to all members of the department. It should show the responsibility and duties of every individual in the department. Nothing else will so assist a new member in grasping his duties and the routine of the department. Nothing will so easily assist to maintain a smoothly working machine. In addition, the department should have a manual describing briefly the work of the department, the routine orders and records, and the method of handling the business of the department.

It is essential in any organization that the head of the division select one or more of his men and train them to be able to take his place as division head in the event of promotion, sickness, vacation or resignation. The true test of management is whether or not the manager or superintendent feels that if he were suddenly called away for several weeks, his department could continue to function efficiently during his absence. The president of the company who posted the sign, "There is not a man in our employ whose services cannot be dispensed with immediately," had in mind the real criterion of organization.

The particular problems of the commercial department are: (1) to secure new customers and new business in order that the utility may grow; (2) to retain old customers and to anticipate their further needs as well as to show them how to use more of the service of the utility to their own economic advantage; (3) to act as a good-will agency, adjusting major complaints and placing the utility in a more favorable light of public opinion; (4) special work in carrying out expansion or reconstruction programs where direct negotiations with the customers are necessary. To illustrate, in changing from one frequency to another or from direct to alternating current, as is often found necessary, the equipment of the customer must be listed, contracts signed, arrangements made for providing new equipment, and the actual change supervised. In so far as it affects the customer, this is the logical duty of the commercial department.

To expedite the work of the department, certain tools are advisable. First, a well-organized filing system preferably handled by one individual in each division. Ample indexes and cross-indexes should be provided. Papers should be securely fastened in manila folders and filed chronologically. Data concerning the individual customers and prospects should be entered on a record card. In addition, a complete record of the demands, consumption and billing for certain customers should be kept monthly by the power and lighting sales departments. This should include all of the larger customers and representative smaller customers in various industries. The card records thus kept are valuable in considering new business and in answering inquiries about present customers. A "load factor card" affords valuable

*Forms Used in Commercial Department Work*

No. 1.—Request for estimate on extension or alteration of service indicating necessary information regarding existing conditions.

No. 2.—Record of customer's connected motor load used by billing department; a similar form is used for lighting.

No. 3.—File card for office record.

No. 4.—Notice to billing department of change in customer demand.

No. 5.—Form used to study customer's monthly demand and energy consumption.

data on a customer's record. This may be modified to suit the particular organization and its rate schedules. The data from the load factor cards should be totaled and averaged annually, classified as to industries and tabulated in a form similar to that shown. Copies of the total report thus prepared should be placed in the hands of each member of the department interested. It makes a useful reference book and permits comparisons of figures for different customers.

### USE OF TECHNICAL JOURNALS

The commercial department should have at its disposal copies of the various technical magazines, and the salesmen should be kept informed of current articles pertaining to their respective fields of work. Publications covering the various industries should be available. Close contact with the statistical department is valuable to the commercial department as augmenting its own data. Typical blanks used in power and lighting sales departments are shown in the accompanying group of illustrations. These cover practically all the usual requirements for information which is desired on standard forms or is needed for ready reference.

Routine visiting of customers is an important function of a utility sales organization. Customers as well as prospects should be visited as often as facilities permit. Some companies have in operation systems whereby each salesman reports in detail all calls. This may be and is useful in the sales of domestic appliances, but it is doubtful whether it will work or is necessary in power and lighting sales work. Too much time of the salesman is apt to be used in making reports. More money spent on transportation to expedite calls seems more logical. The writer believes that whereas written reports on major customers and prospects may be advisable, more can be accomplished by a conference between each salesman and his immediate superior once a month or oftener. The conference should cover the general field of the salesman's activities and should be supplemented by a written summary made by the salesman, giving briefly the status of each customer and prospect. Department meetings now and then are helpful if properly conducted and not allowed to become a place for trivial discussions on the part of those attending them.

From time to time, either yearly or at most every two years, a summary of prospective load on both present and possible customers should be made either by a field survey made by the salesmen or by compilation from the records at hand as checked against the latest information available from the salesmen. By means of such a survey it is possible to concentrate upon the acquisition of the most valuable business, leaving the less valuable load as a secondary consideration. Only by means of such a survey can the work of the department be logically planned.

Consideration should be given to the fact that more and more the work of public relations is coming to be associated with the commercial department. Already in many organizations the commercial department handles most complaints as to billing and service. It may be advisable to add to the commercial department a fourth division to handle customer or public relations. The salesmen, who should be men of above the average intelligence, are constantly furthering public relations. Utility commercial departments could logically handle advertising, arrange plant visits, secure speakers on utility subjects, and otherwise work to win the good will of the public.

## Daytime Window Lighting Effective

TESTS made by the Tennessee Electric Power Company have proved that high-intensity show-window lighting is very effective during the daytime to dispel reflections. Data collected from the test are given in the accompanying table and show that the attractive power of the window was increased 93 per cent with high-intensity illumination.

These tests were made in one of the windows of Loveman's department store in Chattanooga, the lighting units being arranged as shown in the accompanying diagram. Regular night illumination is furnished by ten 150-watt lamps on 14-in. spacing. For high-intensity illumination four 500-watt lamps were installed, these being placed on 2-ft. 4¾-in. centers. For the daylight tests all of the lights were used. Tests have also been made on some of the other store windows in Chattanooga, using the regular fixtures for daylight use. All of these tests have proved conclusively that the attractiveness of the windows is materially increased.

# Distributing Goods Through a Bonded Warehouse*

By Charles L. Eidlitz

*Chairman Board of Governors*
*Electrical Board of Trade of New York*

WHAT is the loss to the industry because of slow-moving stock? Is there not a remedy or help for it? Assume, for argument's sake, that there are 1,000 jobbers and dealers in the metropolitan district. Each one must carry a stock of thousands of items, and many items must be carried in large quantities. This means two things—a large outlay of money to purchase the stock, and an expense for warehousing or stocking space. If a way could be found for relieving this condition in the industry, yet making the stocks immediately available to all the adjacent markets, would it not be a great saving all around?

The manufacturer, on the other hand, who distributes through these channels, must make up large quantities in order to furnish the stock to these many sources. Now a manufacturer, as a rule, is not very greatly interested in having his products on some man's shelf in a dust-covered or dilapidated condition, even if it is paid for. He wants his material sold and moved in order that the supply of new orders shall come in steadily. Yet, in many lines, the fact is that certain distributors buy their stock and then do not move it, owing to several reasons. They may not have the kind of trade that requires these lines, or they may be particularly active in some specialties, making very little effort to sell the other materials, or they may be lazy and incompetent, but the net result is that the manufacturer has thousands of dollars' worth of his material, paid for but still not being consumed, while other jobbers or dealers are calling for more and more on re-orders. And then, suddenly, these slow-movers are sold at a bargain or at a bankrupt sale by the company which has been unable to dispose of them through its ordinary channels for one reason or another, completely demoralizing the market.

It is quite possible that certain materials might find a better market in a different locality, such as Philadelphia or Chicago and, when these calls come in, if the manufacturer could gather up his surplus or slow-moving stock from the inactive jobbers or dealers, which he cannot do at the present time, and put it where it would be consumed, instead of having to manufacture more of it, his situation from a manufacturing standpoint would be greatly improved. I am confident that there is a solution to this problem of distribution and would suggest that some consideration be given to the establishment of a bonded warehouse, operated possibly by the Electrical Board of Trade, or some other agency. Manufacturers could ship in a quantity of material to take care of the requirements of the metropolitan district, under bond. The individual jobber and dealer would buy only a small supply, which would be shipped directly. Whenever they needed a stock, they could order it out of the bonded warehouse, and the manufacturer could give instructions as to the honoring of such orders. The warehouse would deliver, take a receipt and send the manufacturer the receipt, so that he could bill direct. The manufacturer would thus be in direct control of his goods, could shift them in any desired quantity to other neighborhoods, his investment would be smaller and the jobbers' money would not be tied up. There are innumerable banking, financial and other benefits that would result from this plan, to say nothing of reducing frozen assets by 50 per cent or more.

Of course, there are many details that must be worked out, but it does seem that there is enough in the idea to warrant giving it consideration. The cry nowadays is "simplification and economy in distribution." To my mind, the bonded warehouse is one answer to this distribution problem.

---

# Attractive Sales Quarters in Portland, Ore.

ONE of the most attractive merchandise salesrooms of any central station on the Pacific Coast is that of the Northwestern Electric Company in the new Public Service Building, Portland, Ore. High-intensity lighting is one of the special features. The sales floor is approximately 75 ft. x 100 ft. and has an average intensity of 22 foot-candles with 6 watts per square foot of floor area provided by eight 1,500-watt and 32 500-watt Ivanhoe "Celestialite" units.

Spacious windows and special attention given to show cases and arrangement of display give the whole room a pleasing ensemble effect.

APPLIANCE DISPLAY ROOM OF NORTHWESTERN ELECTRIC COMPANY, PORTLAND, ORE., HAS 22-FOOT-CANDLE LIGHTING INTENSITY

# Letters from Our Readers

## *Transmission Line Insulation*

*To the Editor of* ELECTRICAL WORLD:

It is impossible for engineers familiar with modern laboratory methods used in the testing and design of high-voltage insulators to read Mr. Austin's article, "Transmission Line Insulation," without comment.

It is a recognized axiom that laboratory data are only applicable in the solution of field problems when they account for all the factors which are encountered in the field without addition or subtraction. At the present time there are ample field data to prove that sustained high frequency does not exist upon transmission lines. Moreover, by a simple calculation it can be shown that the power necessary to maintain on a line high frequency of a sufficiently large voltage to cause insulator flashovers would be so great as to preclude such a possibility. Be that as it may, the weight of the evidence indicates that the existent surges are of a single impulse or highly damped character of relatively low frequency.

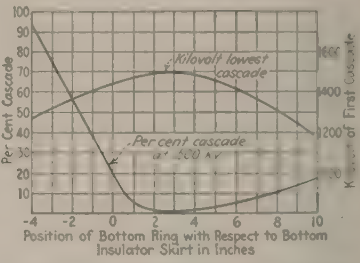
Unfortunately, much of the evidence presented in Mr. Austin's paper deals with the use of a sustained high frequency of 70,000 cycles. In this connection the author states: "This class of test has been questioned, but it must be remembered that where wood is used in series with an insulator this test will give lower values than an impact having a very steep wave front." It is not a matter of being "questioned." It just cannot be accepted as anything more than an interesting exhibition of a certain type of air breakdown, entirely unrelated to the problems at hand. Since sustained high frequency of 70,000 cycles does not exist in the field, laboratory results based on the use of such a source of power are of academic interest only.

Those who have made a study of the arcing characteristics of different types of alternating current and surges realize that the mechanics of breakdown of air gaps when subjected to a steep voltage wave front or 60 cycles is entirely different than with 70,000 cycles.

The failure of the air in the latter case is due to the persistence from cycle to cycle of ionized particles in the path of the discharge. This is not so with the two former types of voltage breakdown. Evidence of this is shown in Fig. 1* of Mr. Austin's article. Unfortunately, for the sake of comparison the tower clearances about the two strings shown are entirely different. It can be clearly seen, however, that by dampening the corona with cages about the conductor and by putting porcelain tips on the arcing horns of the string shown in the left of the photograph that the initial corona point is raised, which consequently tends to prevent the ionization of the air and resulting progressive failure. No doubt the flashover of the string as regards sustained high frequency may be considerably raised by such methods. As already stated, however, such an exhibition is of interest only as a bit of electrical phenomena. Furthermore, the different tower clearances prevent it from being, as the title states, "comparative test at 70,000 cycles." In view of these facts the value of the flashover results in Fig. 4 may well be questioned.

The impact tests shown in Figs. 10*, 11* and 12* cannot go unchallenged. These tests purport to be an impact of 1,280,000-volt peak. The voltage and energy of the impulse arc are stated, but no mention is made of the time taken for it to reach a maximum. Those in touch with matters of this nature will realize the importance of this factor. In Fig. 11* the protective device shown is so placed that its value is entirely lost. From the accompanying curve it can readily be seen that this device is dependent entirely on position for the character of its performance. This curve was arrived at only after repeated tests. Any one familiar with impact tests of this type understands how important it is for a number of tests to be given. It is perfectly possible to have a string of insulators equipped with protective devices which would clear an arc nine times out of ten and yet cascade on the tenth impulse. No single picture can possibly tell the whole story.

Mr. Austin's "counter-potential wire" is quite interesting, but apparently not very practicable. The scheme as outlined is to have the line insulators mounted on supports insulated from the ground. These insulated portions are to be bonded together by a wire paralleling the transmission conductors. The theory depends upon the idea that a surge will raise the potential of the insulator supports to a potential corresponding to the conductors because of the charge induced upon this "counter-potential wire." This action is supposed to prevent flashovers. In case of wood-pole construction some such effect might be produced under dry conditions. Unfortunately, Mr. Austin has ignored rain conditions despite the fact that most predatory surges take place under such conditions. Wet wood poles would convert Mr. Austin's wire into nothing more than a poorly grounded ground wire.



ARCING CHARACTERISTICS OF FOURTEEN NO. 7,500 INSULATOR UNITS IN SERIES

Mr. Austin increases the field of application of this device to include lines of steel tower construction. In Fig. 13† of his article is shown a steel tower, the top of which is insulated from the base by means of wooden beams. In the case of such towers the "counter-potential wire" is supposed to raise the voltage of the whole top of the tower to a potential comparable to that of the conductors.

Because of the large capacitance to ground of all the metal work involved and because of the fact that at the moment before the release of the bound charges on the conductors the top of the tower might actually be at a potential below or above ground it is not conceivable that the "counter-potential wire" would function at all as outlined. Rain, of course, would have the same bad effect as in the case of the wood poles.

The use of an insulated ground wire is undoubtedly a good idea under certain conditions. In fact, the whole idea is making use of the insulating effect of wood construction, which, while new, is worth attention.

It is unfortunate that the data contained in Mr. Austin's article are clouded by the methods of test used and the lack of recognition of contemporary research.

† ELECTRICAL WORLD, *Dec. 31, 1927.*

# Digest of Electrical Literature

## *Hydro-Electric Development and Steam Equipment*

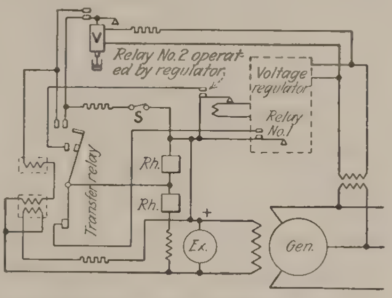
*Vernayez Hydro Station.*—The present capacity of this plant, which serves primarily to supply part of the Federal Railway electrification of Switzerland, comprises two 11,000-kva., 16⅔-cycle, single-phase generators and one 14,000-kva., 50-cycle, three-phase machine, driven by Pelton wheels under a head of 2,000 ft. of water. All three generators operate at 333⅓ r.p.m. The large size of the machines made it necessary to build the stator in four parts. The highly insulated and heavily braced winding gives a potential of between 15 and 16.5 kv., and was tested at 39 kv. Each of the six poles is held in the five rotor hub plates by means of special wedges, seated in carefully machined circular slots. The pole face is laminated and carries a strong damper cage. The pole winding consists of two concentric edge-wound copper strip coils. At 0.75 power factor and full load the single-phase generators have an efficiency of 92.7 per cent. Automatic $CO_2$ fire-extinguishing equipment is installed on each generator.—*Bulletin Oerlikon*, December, 1927.

*Combined Low Temperature Carbonization and Combustion.* — David Brownlie.—Two defects in electricity supply practices are mentioned in connection with steam generation, the loss due to latent heat in the condenser cooling water and the combustion of raw coal under the boilers. In discussing the combustion problem, the use of a combination of low temperature carbonization and combustion, which submits coal to suitable heat treatment previous to the use in the boilers and separates liquid products before burning both gas and fuel in the combustion chambers is advocated. A description of low-temperature carbonization plants which have been in successful operation for some time is followed by an exposition of some of the more recent developments of the basic processes involved. The new Bartling process is suggested as a most interesting development in low temperature carbonization of pulverized coal. This process has been used with a special separator for the elimination of solid particles from the gas.—*World Power* (*England*), December, 1927.

*The Effect of Heat Treatment on Cold-Drawn Steel Tubes.*—F. C. Lea.—The extensive use of cold-drawn steel tubes in modern machines and structures renders the adequate investigation of their properties a matter of considerable importance. Boiler tubes, it is stated, are not infrequently overstrained in order to increase their length and to make it possible to reuse them after being cut from the tube plate. The test investigation covers the statical and repetition-stress tests on carbon-steel tubes and includes compression tests, torsion tests, changes of density under heat treatment, hardness tests, the effect of repeated stresses, the effect of gradually increasing the repeated stress and similar factors of a significant nature.—*Engineering* (*England*), Dec. 23, 1927.

## *Transmission, Substation and Distribution*

*Protection from Overvoltage Due to Voltage Regulators.*—J. H. Ashbaugh.—In the event that regulator contacts become stuck voltage may be raised to a high value. This is often a direct result of excessive condenser capacity across the contacts. It is stated by the author that excessive capacity used for contact protection will produce a large current, which, together with a relatively high resistance, induces a welding action. As the tendency to weld increases with the amount of condenser capacity used, difficulties may be reduced by a curtailment of condenser capacity. Several methods and devices may be employed to eliminate this welding action with ensuing high-voltage conditions, but most of them have limitations. A scheme is now available for the protection of small stations whereby they may be assured of continuity of service without any hazard of overvoltage due to the failure of regulator contacts. The device is quite simple and may be added to any existing installation. It consists of adding an auxiliary rheostat shunting relay, actuated by the regulator, to which is transferred the regulating duty if the contacts of the regulator relay should stick together. This device has a time delay feature which prevents the transfer from taking place for transient voltage changes due to load variation. The time delay is adjustable to suit the individual station or load conditions. The transfer must be smooth and exceedingly fast. In case of overvoltage, the regulator brings the voltage back to normal with all the speed for which the vibrating regulator is noted.—*Electric Journal*, November, 1927.



TRANSFER RELAY PLAN PREVENTS REGULATOR OVERVOLTAGE

## *Generation, Control, Switching and Protection*

*The Application of Relays for the Protection of Power System Interconnections.*—L. N. Crichton and H. C. Graves, Jr.—A compilation of many of the new methods for relay protection required by superpower interconnections. The ideas have been obtained from various sources and represent present-day practices. The general requirements for such interconnections are mentioned, with particular reference to protection against phase-to-phase short circuits in those cases where the short-circuit current, under certain system conditions, is less than the full-load current under other conditions. The clearing of accidental grounds is discussed and a new study of the residual currents on systems of different types is given. The usefulness of certain inverse time limit relays on systems having dead-grounded transformer neutrals at all switching stations is indicated. A typical relay installation is offered as an example and is similar to that now being placed in service on a 200-kva. interconnection.—*Report American Institute of Electrical Engineers*, November, 1927.

*De-Excitation of Large Generators.*—R. Pohl.—Two basic methods are known to quickly de-excite large generators—the introduction of resistance and the motor method. The latter, in most instances, utilizes the exciter as a motor with its field reversed and is then combined with the former. Both methods are critically investigated in this discussion. It is stated that at the same voltage peak on the collector rings the methods are equally fast, providing that the exciter operates as main motor with moderate iron saturation. Conditions may be improved if the motor is provided with constant excitation and is highly saturated during the period of de-excitation. The important influence of the damper winding on large turbo-generators is investigated. It is shown to be permissible to open the inductor circuit directly on large generators without undue increase of the voltage on the collector rings. This gives a simple and effective means of de-excitation. — *Elektrotechnische Zeitschrift*, Nov. 24, 1927.

## *Motors and Control*

*Protection Systems in Coal Mines.*—E. P. Austin.—The practices involved in the wiring and protection, through relays and similar devices, in the coal mines of Great Britain are reviewed. Among the conclusions derived as a result of this investigation are: Neutral points should be grounded, leakage and overload protection should be used on each main feeder and sub-feeder, pumps and large haulages should have separate feeders so that faults on distribution cables will not affect these important units and fuses should be used only on single-phase, low-voltage circuits. It is stated that greater safety below ground would result if the existing rules were supplemented along the lines indicated so that there would be a definite uniform standard for every mine.—*Electrical Review (England)*, Dec. 23, 1927.

## *Electrophysics, Electrochemistry and Batteries*

*The Boltzmann-Hopkinson Principle of Superposition.*—F. D. Murnaghan.—The principle of superposition for dielectrics, discussed by Hopkinson, has been used for some time in experiments. The validity in regard to the several theories which have been advanced for dielectric behavior has been shown in only a few cases. One of these exceptions is the important theory of Maxwell. This paper shows that the principle of superposition is a necessary consequence of Maxwell's theory. It goes somewhat further and shows that the principle is valid for any theory which leads to a system of linear differential equations with constant coefficients.—*Journal American Institute of Electrical Engineers.*—January, 1928.

*High Voltage Insulators.*—W. Huter.—A detailed critical review of the various types of insulators and leads, such as are used today on high-voltage apparatus, including bushings and post insulators. Single-piece and two-piece air and compound filled porcelains are described and data given on the dielectric properties of filling compounds. The characteristics of oil-filled bushings are discussed in connection with the great improvement realized through the introduction of solid cylinders in series with the oil. Condenser type paper leads and multiple tube porcelain bushings are described. Examples of failures are offered for each type.—*Elektrotechnische Zeitschrift,* Nov. 3, 1927.

## *Units, Measurements and Instruments*

*33,000-Volt Cable Testing.* — M. Hochstadter and E. Bowden.—A review of present day high potential cable-testing practice and a suggested specification of factory and installation tests embodying a combination of the usual methods. The specification as offered is based upon a large amount of experience and it is considered that the conditions are wide enough to be met by all manufacturers with modern plant and reasonable care in design and manufacture and at the same time strict enough to safeguard the interest of the buyer in his endeavor to obtain a cable that can be relied upon to give satisfactory service. The factory test suggested includes dielectric resistance, pressure, capacity, dielectric loss, breakdown, bending and stability. The installation test includes pressure, dielectric resistance, current rating, and joint and terminal box pressure test. It is suggested that these tests be taken under conditions such that the wave form of the supply be as nearly as possible of sinusoidal shape.—*Electrical Review (England)*, Nov. 25, 1927.

## *Telegraphy, Telephony, Radio and Signals*

*Design and Application of Giant Loud Speakers.*—F. Trendelburg.—The author gives a mathematical explanation of the phenomena involved when mechanical energy is transformed into acoustical energy. The ideal sound emitting surface is a sphere, or, as the author calls it, a "breathing sphere." Approximations to it are cones, circular diaphragms and large square surfaces. Small cones and diaphragms require mechanical sound amplification by means of a horn. Characteristics of paper and metal horns are given, indicating their varying sensitiveness depending upon the sound frequency. It is claimed that for large sound energies, such as are required by public address speakers, the condenser type with an emitting sheet 20 x 20 in. gives best results with a minimum of distortion within a range of 50 to 8,000 cycles. Interesting semi-circular diagrams are given to show the directional sound distribution for two types of such speakers for frequencies between 200 and 7,000 cycles. Operating experiences with giant loud speakers are given. Tests made in a stretch of open country indicated that a hornless sheet speaker, as mentioned above, permitted the spoken word to be clearly understood over a distance of ½ mile. — *Elektrotechnische Zeitschrift,* Nov. 17, 1927.

## *Traction*

*Economies Effected by the Electrification of the Paulista Railway.*—S. B. Fortenbaugh.—Data for the electrified Paulista Railway of Brazil are offered, with comparisons of previous operating expenses for the same railway when using other means of motive power. The comparative figures thus included cover a period of several years and have been reduced to a train-kilometer basis and evaluated upon the same plan. As wood, coal and oil were all used under the previous operating conditions, unusually interesting comparisons have been developed.—*General Electric Review,* December, 1927.

*Electrical Equipment of Electric Road Vehicles.*—L. W. de Grave.—Features involved in the design and operation of electric trucks are considered in relation to operating economies and reliability. The relative merits of battery control through resistance and resistance control are discussed. The question of shunted-parallel fields, as well as brake interlocks, regenerative control, electric brakes and the specifications of controller contacts and fingers are considered. A brief consideration of the most economical operating procedure is offered. — *The Electrician, (England)*, Dec. 9, 1927.

## *Miscellaneous*

*A Study of the Compressive Strength Dispersion of Materials with Applications.*—John Tucker, Jr.—The express purpose of this article is to propound a theoretical fundamental theory for the compressive-strength dispersion of homogeneous isotropic materials and to substantiate these theorems by previously published relevant data, where available, and by specially prepared specimens where no data exists. The strength dispersion to which reference is made are those variations from the mean, exhibited in the ultimate strengths of individual test specimens made of a uniform material and under uniform conditions, for which there are no assignable or controllable causes. Basic experimental data, from which the ultimate strength dispersion parameters may be computed, are very meager, since a large number of multiplicate test specimens are necessary to determine these parameters with a satisfactory degree of precision. In order to obtain the necessary data, portland cement mortar and concrete were selected as the materials, and a number of test cylinders of these materials were made and tested in compression. As a result of this investigation, the author states that the strength dispersion has been found to be an essential factor in safe-stress determination, and that the strength-frequency curve is of the normal form, or very close to the normal form, and of such character as to permit its use in engineering calculations. —*Journal of The Franklin Institute,* December, 1927.

*Temporary Safety Grounding.*—A review of desirable practices in connection with temporary grounding methods as used by a number of the leading electric light and power companies. The grounding practices involved in connection with all types of electric equipment are included. As the result of the investigations of this committee it is concluded that every company should have a set of rigid rules and instructions for temporary grounding, adequate equipment should be provided and regularly inspected and maintained by a competent employees, instruction and training in grounding methods as approved should be given employees and temporary grounding should be performed under close supervision.—*Serial report Accident Prevention Committee, National Electric Light Association,* October, 1927.

*Physical Properties and Methods of Test for Sheet Brass.*—H. N. Van Deusen, L. I. Shaw and C. H. Davis.—An investigation undertaken to secure a simple and reliable method of test for thin-sheet non-ferrous metals. Considerable attention has been given to the Rockwell tester, which, as the result of this work, has been found satisfactory for use as a specification instrument for brasses 0.020 in. and thicker when used under standardized methods of test and calibrated in terms of a standard instrument.—*Reprint B-269, Bell Telephone Laboratories, Inc.*

# News of the Industry

## Walsh Modifies His Resolution

### Senator Himself Suggests Limitation Eliminating from Proposed Inquiry Intrastate Non-Subsidiary Companies—Cortelyou and Addinsell Testify

By Paul Wooton
*Washington Correspondent of* Electrical World

INDICATIONS are, as this is written, that the Senate committee on interstate commerce will conclude its hearings on the Walsh resolution before the end of the week. The prospects are that the committee will recommend an investigation of those phases of the electric and gas utility businesses which clearly come within the jurisdiction of the federal government, but the case made against even such an investigation is considered so strong that there is doubt whether the Senate itself will approve the resolution, however modified. Senator Walsh himself proposed the limitation, which is carried in a proviso he intends to add to his resolution. It follows:

"Provided that nothing herein contained shall be deemed to authorize the committee to inquire into the affairs of any corporation engaged wholly in intrastate business not being a subsidiary of or whose stock or operations are not held or controlled to some extent by another corporation."

Senator Walsh's proposal led to an animated discussion among members of the committee in which Chairman Watson, Senator Hawes of Missouri and Senator Sackett of Kentucky were the chief participants. Senator Watson said: "I think the terms of the resolution itself ought to fix its extreme boundaries and its widest limitations, and that they ought to be compelled within those boundaries of limitations to make this inquiry and not trust to the whims, if you will permit me to use that expression, of the members of the committee." Senator Walsh replied that the limitations of the resolution could not well be fixed more definitely. "I think you can safely trust to the good sense and the good judgment of the committee with respect to these matters," he said. Senator Hawes and Senator Sackett took issue with him, Senator Sackett objecting to requiring "an intrastate holding company to come into court to maintain its rights under the Fourth Amendment, without any reason or power, apparently, in the federal government to force it to do it." To this Senator Walsh replied:

"If their stocks were not sold in the market, that might be the case, but even so, in order to legislate with relation to the general subject of those that are engaged in interstate commerce, should we not have an opportunity to inquire about how they do their business? Maybe it would serve as a good guide for any legislation. They may operate their business so well and so efficiently and so securely that we ought to enforce a similar system upon other companies."

#### Cortelyou Gives Testimony

When the hearing before the committee was resumed on Friday, Jan. 20, former Secretary of the Treasury George B. Cortelyou, now president of the Consolidated Gas Company, New York, and chairman of the Joint Committee of National Utility Associations, testified. He explained that the utility companies disapproved of the proposed inquiry on three grounds—first, that no facts showing an investigation to be necessary have been presented; second, that the Walsh resolution is too broad in its scope, and, third, that Congress lacks jurisdiction to either investigate or legislate on most of the points raised in the resolution.

Mr. Cortelyou contended that the people have been the gainers whenever a group of power companies have combined for economic reasons. Improved service and lower rates have invariably followed, he said. Combinations became imperative when the demands of industry in general became so heavy that in many cases local supplies of capital proved insufficient to meet the increased demands, the witness testified. This drift toward consolidation of the smaller companies began during the World War and has been growing ever since. Many hundreds of millions of dollars more will be required, he said. Pointing out that municipalities and states impose strict regulations on the companies and require periodical and comprehensive financial and other reports, Mr. Cortelyou maintained that the industry is "almost constantly under what could be called investigation."

H. M. Addinsell, vice-president of Harris, Forbes & Company, New York bankers, after outlining to the committee the thorough investigations his firm makes before undertaking to sell utility bonds, expressed the opinion that such bonds are the safest and best securities available. He mentioned preferred stocks of public utilities also as safe. Senator Dill asked what the studies made disclosed as to the securities of holding companies, and the witness replied these securities were not so preferred a risk, since they came after the bonds and stock of the companies controlled. He expressed satisfaction with the policies of holding companies.

At a later hearing James A. Emery, general counsel of the National Association of Manufacturers, appeared in opposition to the resolution, on behalf of manufacturing industries "concerned in the nature of the power which the Senate is likely to grant to a committee of that body for the purpose of inquiring into the private affairs of individuals and corporations." Mr. Emery brought out the point that the investigation certainly would extend into investment trusts. He called attention to a decision by the Supreme Court which held that "a fishing expedition into the affairs of a stranger for the chance that something discreditable may turn up is forbidden."

#### Letter from O. D. Young

Senator Walsh presented to the committee a letter to him from Owen D. Young which indicated that the General Electric chairman had a different idea of congressional investigations from the one indicated in an article printed in the Brooklyn *Eagle* and which quoted Mr. Young. In his communication Mr. Young said:

"So far as the General Electric Company is directly concerned, if any charges are made by you or by other responsible persons through you against it, I have no objection to any resolution authorizing investigation of the General Electric Company, however sweeping its terms may be. A resolution to investigate the General Electric Company is a specific inquiry. When one starts to investigate an entire industry, however, that is another matter. The resolution, in my judgment, authorizing the investigation should be to investigate specific questions affecting the industry which are clearly set forth and defined. That is especially true if the inquiry relates to any question which may affect credit. To impair the credit of any industry would be a public calamity."

## New 80,000-Kw. Generator for Milwaukee

A turbo-generator with a rated capacity of 80,000 kw. will be installed this year at the Lakeside power plant, according to John Anderson, vice-president of the Milwaukee Electric Railway & Light Company. It will be the largest unit in Wisconsin and is expected to be in operation by Nov. 1. Including auxiliary equipment and necessary extensions to the power house, it will cost $1,461,000. Preliminary work on the extension of the building has been started. The new section will be 72 ft. long, 94 ft. wide and 75 ft.

high. With the addition the building will be 375 ft. long. The unit will be twice as large as any of the present generators at Lakeside. It will increase the capacity of the station to 227,000 kw.

## Boulder Dam Before a Senate Committee

*Senator Johnson Attacks Power Companies and the Joint Committee of National Utility Associations as Sources of Adverse Propaganda*

A FAVORABLE majority report on the Swing-Johnson Boulder Dam bill will be made to the House of Representatives after Feb. 1, Chairman Smith of the irrigation committee now thinks. The probability is that Representative Douglas of Arizona will make a minority report. The Senate committee on irrigation and reclamation has begun its consideration of the measure, and Governor Dern of Utah has repeated before it the plea he made to the House committee that legislation be withheld pending another attempt by the seven Colorado Basin states to reach an agreement. Governor Dern predicted that under a six-state agreement, such as is proposed by California, Arizona would get all of the upper basin water and California would get all of the lower basin water, thus completely depriving the upper basin states of their water rights.

The Muscle Shoals issue was injected into the discussion by Senator Dill of Washington. He wanted to know why, if the principle is established at Boulder Canyon of allowing the states to collect power royalties, the same idea could not be applied to allow Alabama to collect similar charges on the nitrates that may be manufactured at Muscle Shoals. Governor Dern said that he had not considered this question, but that he was not advocating any rights along the Colorado that could not be applied at other places.

Regarding a statement made by Governor Dern that the charges of power propaganda behind the opposition are a smoke screen, Senator Johnson asked the Governor if he was really acquainted with some of the propaganda that was being turned out. "Are you familiar with the things being turned out by the organization known as the Joint Committee of National Utility Associations, whose headquarters are at 420 Lexington Avenue, New York?" he asked.

Thomas Maddock, former State Highway Engineer of Arizona, and John L. Gust of Phoenix, representing the water users of the Salt River Project in Arizona, spoke in opposition to the bill. George W. Malone and C. P. Squires, members of the State Highway Commission of Nevada, said their state favored it, provided there was an assurance of reasonable revenue. Governor Emerson of Wyoming spoke in opposition to the measure as it now stands.

# Merchandising Holds Stage at Chicago

### N.E.L.A. Commercial Committee Members Discuss Plans and Hear of Progress Made in Many Directions to Formulate Proper Selling Policy

MERCHANDISING held the center of the stage at the three-day meeting held on Jan. 18-20 of the eleven committees of the N.E.L.A. Commercial National Section at the Edgewater Beach Hotel, Chicago. Chairman Greenwood of the general merchandising committee presented three features of unusual interest. He reported the satisfactory conclusion of a series of intertrade conferences which have been participated in by the national officials of the various retail trades merchandising electrical household appliances, the purpose being to develop a common understanding of some of the principles of merchandising policy in which there has been conflict between the power industry and the retail trades. Through these meetings certain fundamentals have been defined which are acceptable to all and which received the signature of the representatives of dry goods, hardware, furniture and druggists' associations. This agreement was approved by the executive committee of the Commercial National Section, but is not yet released for publication.

The merchandising committee also reported and received approval on the program to conduct a series of laboratory and field tests to determine the load and service characteristics of the oil burner. Laboratory tests will be conducted in an independent laboratory to which manufacturers may bring their equipment for test under standard specifications which will be established by a joint committee of the National Electric Light Association, the Association of Edison Illuminating Companies and the Oil Heating Institute. The field tests will be conducted in about six cities under the specifications and direction of this joint committee. The committee also announced the ten-thousand-dollar prize contest details of which are given on this page.

The power committee is at work on serial reports that will analyze competitive power conditions in a number of industries such as flourmills and woodworking plants. The electrical advertising committee reported the organization of two schools to be conducted in March, one at Harrison, N. J., and one at Cleveland, to provide a special course of training for central-station salesmen in developing electric sign load. The home-lighting committee indorsed the program of the Industry Sales Conference, which is now developing a sales plan for the electrical industry in the residence field. This committee has collected a compendium of experience in refixturing, which will soon be published as a serial report. The lighting service committee discussed the present slump in industrial lighting and the need of establishing continuity in the development work in this field. It is planning organized co-operation of the architects, and also to correlate the work of the lighting and power salesmen of the utilities, realizing that 50 per cent of the energy sales to some industrial customers consist of lighting.

The wiring committee also indorsed the program of the Industry Sales Conference and approved the program which the manufacturers are carrying forward in developing uniform ordinances throughout the country. A resolution was passed protesting against the delay in the approval of thin-wall conduit for use under the National Electrical Code and demanding a stronger official status for the representative of the N.E.L.A. on the electrical committee. The committee also recorded its disapproval of the inclusion of Safety Code rules in the National Electrical Code. The transportation committee discussed holding a national conference to consider possibilities for the development of battery-charging load, the particular purpose being to demonstrate to the power companies the importance of utilities using electric trucks in their own transportation service. The refrigeration committee approved an advertising program which had been developed by Chairman Richardson. The domestic range committee reported progress on development of a range sales manual and considered the development of an advertising campaign similar to that under consideration for refrigeration. The promotional rates committee held an experience meeting on the effect of the inducement type of rate on the increase of residence consumption. The industrial heating committee obtained an appropriation for the development of a motion picture.

Chairman Davidson announced that the appointment of a commercial executive to be added to the headquarters staff of the National Electric Light Association would probably be made within a few weeks. The attendance at this meeting was unusually large, 209 men being registered.

## "One More Kilowatt-Hour per Home per Day"

An immediate campaign to bring about the consumption of one more kilowatt-hour per home per day all over the nation has been launched by the general merchandising committee, Commercial National Section, N.E.L.A. At the present time the average individual residence consumption throughout the country is 400 kw.-hr. a year, or slightly over one kilowatt-hour per day. This produces an average annual revenue less than $30, which the committee thinks scarcely half enough.

At the suggestion of the committee, a fund of $10,000 is being subscribed, chiefly by the manufacturers of electri cal equipment and apparatus, to provide $9,000 in prize money and $1,000 for the expenses of the contest. Three first prizes of $2,000 and three second prizes of $1,000 are offered to member companies, grouped in three classes as follows, according to their present average annual energy sales to residence customers: Class A, 451 kw.-hr. or over; class B, 351 to 450 kw.-hr.; class C, 350 kw.-hr. or under. Cash prizes of $2,000 or $1,000 will therefore be won by the sales departments of the six power companies that in 1928 show the best and next best increases in average consumption per residence customer in their respective classes.

## Local League Officials Discuss Their Problems

A special midwinter conference of officials of local leagues was held last week at the offices of the Electrical Association in Chicago to provide an opportunity for the discussion of the practical details of league operation and development. Seventy-three league men were present, representing thirty-five leagues from Boston to Denver and from Winnipeg to New Orleans.

The discussion embraced a wide variety of league problems, such as central-station dealer financing, labor, ordinances, radio sections, non-electric members, the "curbstone" contractor, compensation of field men and how to keep members "sold." The most important theme was the "red seal" plan and the need for a national specification that will permit broader use of the "red seal" idea in national advertising and in house plans sold by the national services. The conference approved the program for uniform specifications.

In a general review of league experience, methods for promoting industrial, commercial and domestic lighting were discussed and the responsibility of the leagues for the education of the small housewiring contractor had particular consideration.

The four sessions were presided over by J. E. North, Cleveland; Burke Corcoran, Chicago; D. C. Birdsell, Philadelphia, and Earl Whitehorne, New York.

## East Central Division Takes Up Commercial Topics

Opportunities for building additional loads and methods of obtaining this business by central-station companies occupied the attention of about one hundred utility executives and commercial managers at a Commercial Section meeting of the East Central Division, N.E.L.A., at the Hotel Statler, Cleveland, on Jan. 23. Pointing to the low average kilowatt-hour consumption per domestic customer, T. O. Kennedy, vice-president and general manager Ohio Public Service Company, drew a picture of possibilities for load development, while H. W. Derry, section chairman, presented a graphical analysis of industrial electrification, showing that while approximately 73 per cent of the industry is electrified, only 44 per cent of industrial power is purchased from central stations. He dealt particularly with the use of process steam to generate power in industrial plants.

Discussing methods of rural electrification, J. B. Johnson of Elyria, Ohio Public Service Company, advocated that central-station companies become more active in selling electrical equipment to farmers and cited the fact that his company in ten months' co-operation with a farm implement dealer had effected the sale of $29,000 worth of such apparatus.

Commenting vigorously upon the necessity of selling additional wiring in old homes, G. E. Miller, sales manager Cleveland Electric Illuminating Company, pictured the difficulties that have been encountered, declaring that basically the cost to the customer is too high.

Progress in electric heat applications was outlined by W. E. Benning, Cleveland Electric Illuminating Company, progress in selling electric ranges by H. H. Davis, Northern Ohio Power & Light Company, and progress in selling domestic electric refrigerators by E. Schmidt, Toledo Edison Company.

At the section dinner a paper by Frank Newton, Commonwealth Power Company, on rates and formation of rate structures, with particular reference to their relation to commercial development, was read by M. W. Arthur in Mr. Newton's absence.

## North Central N.E.L.A. Engineers at Minneapolis

More than two hundred engineers attended the annual conference of the Engineering Section of the North Central Electric Association held at the Nicollet Hotel, Minneapolis, on Jan. 20 and 21. Chairman H. J. Underhill gave an outline of engineering development in the district, and Secretary John W. Lapham outlined the "Developments in the Industry in This Division."

Other addresses on the opening day were: "Relation of Accounting to Engineering," E. G. Kellett, Minneapolis; "Relation of Commercial Activities to Engineering Activities," Carl J. Johnson, Fergus Falls; "Relation of Engineering to Public Relations Activities," T. D. Crocker, Minneapolis; "Lightning and Its Effect on Transmission Lines," J. H. Cox, Westinghouse Electric & Manufacturing Company, and "United States Power Developments," Major H. S. Bennion, New York. Major Bennion spoke at the banquet. Leaders of technical group conferences were William Brown, F. R. Rice, George Loughland, W. J. Sorenson, R. A. Farmer, J. L. McEachin, W. L. Wadsworth and J. A. Colvin. Saturday's program included addresses by E. C. Markley, General Electric Company, on "Carrier-Current Communication Systems," and "Methods of Evaluation of Light and Power Properties for Taxation," by C. H. Nelson of the Minnesota Tax Commission.

## N.E.M.A. Hears About Inter-Industry Struggle

*Director of Institute of Steel Construction Chief Speaker at New York Meeting of Supply Division—Section Conferences All Week*

ONE hundred and twenty-five leading manufacturers in the electrical industry concentrated their attention on merchandising policies on Jan. 24, when the semi-annual meeting of the Supply Division of the National Electrical Manufacturers' Association opened at the Hotel Commodore, New York. The principal speaker, Charles F. Abbott, executive director of the American Institute of Steel Construction, Inc., described what he called "the third industrial revolution," meaning the inter-industry struggle for markets. The capacity of industry to produce faster than the market can consume, coupled with co-operative advertising campaigns which quickly change public taste, offers a problem which industries must meet with the soundest merchandising principles, Mr. Abbott said. Careful market research, selection and training of competent salesmen, co-operative advertising on a scientific basis, selling on service rather than price and organization of industry along co-operative lines were some of the guiding principles offered to the electrical manufacturers by him.

The meeting was opened by D. Hayes Murphy, vice-president of the National Electrical Manufacturers' Association in charge of the Supply Division. Managing Director Waller announced the appointment of W. J. Canada as N.E.M.A. engineer and the coming publication of a book to be called "The National Electrical Code—Its Purpose and Development."

H. T. Bussmann, president Bussmann Manufacturing Company, St. Louis, in describing the activities of the electrical Industry Sales Conference said that little or nothing has been done by the electrical industry up to the present time to give the public a complete picture of the value of electrical service and appliances. Before such a program can be accomplished thirty thousand contractors who are now facing a dwindling market must be educated to better selling and business methods, he said. The contractor must be taught to sell outlets not as outlets but on the basis of the service which such outlets will render. A marketing counselor is now needed, he held, to correlate the reports already made by the electrical industry sales conference and to build up a complete sales story.

S. L. Nicholson told the meeting of the establishment of harmonious relations between the manufacturers and the Underwriters' Laboratories in the past year.

An entertainment was held at the dinner-hour on Tuesday evening, followed by a theater party on Wednesday night. An extensive program of sectional meetings and activities was carried on throughout the week.

# Power Board Proceedings

*Far Western Projects Continue to Provide the Major Part of the Work, but Missouri, Virginia and Texas Are Heard From*

IN ADDITION to the authorization of licenses and permits noted last week (page 165) the Federal Power Commission at its meeting on Jan. 18 sanctioned a license for the Idaho Power Company of Boise covering two constructed projects on public lands on the Snake River. These are the Lower Salmon Falls plant near Gooding, an 8,700-hp. project, and the Swan Falls plant near Boise, a 12,000-hp. plant. They have been in operation for many years. They were built by other companies. Another license authorized was for Harry V. Gates of Hillsboro, Ore., and covers a 352-hp. project on Crooked River, Ore. The Seafoam Mines Corporation of Seafoam, Idaho, obtained a license covering a 240-hp. project on Fleet Creek.

The preliminary permit issued under date of Nov. 6, 1925, to the Oregon-California Hydro-Electric Company for projects on the Zigzag, Salmon and Sandy Rivers in Oregon was extended to Nov. 6, 1928. An extension until Dec. 3 was granted Arthur Moa of Ketchikan, Alaska, applying to his preliminary permit for a power project on Fish Creek in the Tongass National Forest, and an extension of eighteen months from May 26 was authorized for the project of the Red River Lumber Company of Minneapolis on Nat Creek, Shasta County, Calif. Three preliminary permits issued to George B. McClary of Chicago, covering projects on Rock River in Illinois, were canceled.

An application from the Southern Sierras Power Company of Riverside, Calif., for an extension until Dec. 31, 1929, of the construction time allowed on parts one and two of its project on Snow Creek in the Angeles National Forest was granted, as was extension of time for the completion of the project of the Escondido Mutual Water Company at San Luis Bay River, Calif. The commission denied the application of the Great Western Power Company of San Francisco for an amendment to its license covering its power project on the North Fork of the Feather River so as to "include other works incidental to the power project and the reconstruction of county roads and state highways." The time for beginning construction on the project of the Gold Basis Mining & Milling Company on the East Fork of the North Fork of the Yuba River was extended to July 1.

The commission assumed jurisdiction over a project on Eleven-Point River in Oregon County, Mo., where Jess Priest and W. H. Williams had announced their intention to construct a 60-ft. dam which would create a 20,000-acre-ft. reservoir. In connection with the declaration of intention of the Western Washington Electric Light & Power Company the commission also ruled that it should take jurisdiction. The proposed project is at North River near South Bend, Wash., where navigation is possible. It is planned to construct a dam 100 ft. high which will create a reservoir of 210,000 acre-ft. capacity.

The commission did not take jurisdiction over a small New River project of the Fields Manufacturing Company, Mouth of Wilson, Va. New River at that point is not navigable. The commission also declined to take jurisdiction over the project submitted by James C. Kennedy of Dallas covering a proposed development on Devil's River in Val Verde County, Tex., the Chief of Engineers holding that Devil's River is not navigable. It rejected an application for a license by the Sierra & San Francisco Power Company covering a constructed project on the South Fork of the Stanislaus River to include certain proposed extensions of the plan.

W. J. Prewett of Auburn, Calif., has applied for a preliminary permit covering a project on the North and Middle Forks of the American River. He proposes to build a dam 340 ft. high across the North Fork, forming a reservoir with 600,000 acre-ft. capacity, and to install 100,000 hp. This application conflicts with previous applications made by Walter L. Huber and the American River Water & Power Company.

The Virginia Public Service Company of Charlottesville has applied for a license covering a transmission line to connect the western and southern divisions of its properties. The line would traverse the Natural Bridge National Forest.

Robert R. Severin of Paisley, Ore., has applied for a license covering a small project on the Chewaucan River in Lake County, Ore.

The United Mercury Mines Company of Boise, Idaho, has applied for a permit covering a small project on the East Fork of the South Fork of Salmon River near Yellow Pine, Idaho.

---

## Public Utility Course for Business Executives

A six weeks' summer course in public utility management and economics for business executives will be given July 9 to Aug. 18 next by the Harvard University Graduate School of Business Administration, Soldiers' Field, Boston, under Philip Cabot, professor of public utility management, and D. W. Malott, instructor in this subject. The course will cover various legal, economic, engineering and financial phases of management and will include a study of court and commission decisions covering valuation, depreciation and fair return, besides cases from company practice in methods of marketing, rate making, operation, finance, customer relations and the broad economic problems of production. Classes will meet for four hours daily, and the case method will be followed throughout.

The course is intended for executives and their assistants, statisticians, sales managers and production superintendents of utilities; members of regulatory commissions, investment bankers and teachers of law and business.

# Ask for Short-Wave Bands

*N.E.L.A. Representatives Request Commission for Exclusive Use of Two Groups at Least, but Preferably of Three, for Power Companies*

THIRTEEN officials of large light and power companies in Massachusetts, New York, New Jersey, Pennsylvania, Maryland, Illinois, Michigan and Georgia joined as representatives of the National Electric Light Association in submitting a statement to the Federal Radio Commission when that body last week at Washington held its hearings on short-wave assignments. Asserting that the electric power supply utilities desire "the exclusive use of only a very limited assignment of wave lengths in the interest of maintaining service and in no way for commercial gains," the N.E.L.A. committee made the following response to five specific questions asked by the commission:

1. The electric power supply utilities require space radio facilities as an emergency means of communication for dispatching purposes. Wire communication, whether it be by lines leased from commercial communication companies, by private telephone or telegraph lines, or by carrier current, or by any combination of these, is the primary means of communication in power company systems. However, the acts of God and other uncontrollable events which put out of service the transmission lines of the electric company also put out of service the wire communication in the same geographical area occupied by these transmission lines. In the interconnected electrical systems of today and tomorrow, as well as in local transmission systems, it is absolutely necessary that continuous communication be maintained between strategic points. Space radio offers the only form of communication which will operate between two given points during intervals when wire facilities are inoperative.

2. The prime importance of continuity of electric light and power supply to the large cities, the innumerable smaller communities and to the farm and factory is a subject not open to question or dispute. Dependent upon constant power supply besides the usual industrial and domestic consumers are water utilities, hospitals, signal systems, train-control systems, fire-alarm systems, traffic signals, street lighting and various other uses which directly affect the safety of public life and property. The disastrous effects of allowing a city or town to remain in total darkness for any length of time can be readily pictured. The electric light and power industry serves almost seventy million people, with the enormous capacity of over 30,000,000 hp. Companies serving 40 per cent of this population have already either adopted space radio for emergency communication or are planning to do so at the earliest possible moment.

3. Experience gained in tests over the past two years indicates that the exclusive use of at least two bands, one in the 133-150-meter (2,250-2,000-kilocycle) group, and the other at the second harmonic of the first, should be reserved for this purpose. A third band at 90 meters (3,340 kilocycles) would also prove of great assistance in this work if it could be made available. The width of these bands should be 160 kilocycles. Each station should be allowed to use any allocated band.

4. The power required by electric utility radio load-dispatching stations will be, in

times of emergency, the maximum output that can be achieved by any given station. Under normal conditions the lowest workable power output will be used. In the light of present-day knowledge 5 kw. is suggested as a maximum. The interference likely to be caused to other services in these bands will not offer any obstacle, as the operating contacts which exist between electric supply companies are such that they will be entirely able to police their own bands. This, of course, presupposes an exclusive assignment to electric supply companies. The interference likely to be caused to other countries should not be appreciable, as power company communication requirements will in general be limited to distances of approximately 100 miles.

5. Based on answers to letters sent to all member companies of the National Electric Light Association, it is estimated that about one thousand applications for licenses for this service will be made within the next five years.

It will be some weeks probably before the commission's decision is handed handed down.

## Plans for Hydro Development on New York Lakes

Further details have been given out concerning the hydro project for upper New York State noted in the ELECTRICAL WORLD for Nov. 5 (page 960). The temporary dam at Bradford, on which work has been begun by the Dutcher Construction Company of Sodus for the Lamoka Power Corporation, is to be the first link in a power chain designed to take advantage of the relative positions of Lakes Waneta and Lamoka and Lake Keuka. Several years will be required to complete the project. According to present plans, water will be diverted into Lake Keuka from a power reservoir several hundred feet above Keuka Landing. It will be carried down through mains into a power house to be erected at the landing.

A dam 20 ft. high and one mile long will be constructed at the opening of the Lamoka Valley, one mile north of Savona. Behind the dam will be stored water in an artificial lake 16 miles long and one mile wide covering hundreds of acres of farm land. The lake will extend to Bradford, on the summit of the Wayne Hills. A system of feeders will be constructed from the Conhocton River near Savona into the reservoir. The power company already owns the water rights of the former Baker Mills between Bath and a point two miles west of Savona. Plans call for construction of a race from the mills through Bath to Savona to take advantage of floodwaters by diverting them into the reservoir.

The levels of Lakes Waneta and Lamoka will be raised from five to six feet. At the village of Wayne, which will be the outlet for the reservoir, sluiceways and conduits will carry the water down Keuka Hill to the power house. The present village of Sonora will disappear. The temporary dam will confine the waters of the two lakes. Its completion will be followed by work on the power house in order that generation may begin as soon as possible. Power, it is expected, will be sold to communities throughout northern New York State.

The Lamoka Power Corporation is capitalized at $9,000,000 and is headed by Ray Mills and Warren Mills of Sodus.

## Tacoma Considering Start on Second Cushman Unit

Less than two years after completion of the first unit of Tacoma's municipal power plant on Lake Cushman, which brings in 50,000 hp. for the city system, officials are taking steps toward the construction of the second unit. This is intended to develop 45,000 hp., and Ira S. Davisson, Commissioner of Light and Water, declares that, according to present indications, it will be needed to avoid a power shortage in the winter of 1930-31. Mr. Davisson asked the consent of the Council to bring in ordinances providing for starting work on the second unit, but the Council asked for more time to study the situation. The proposed ordinance would appropriate $4,000,000. A 13,000-volt transmission line from Unit No. 1 at Cushman to the site of the projected second unit, with a connection to the site of the second dam to be built, is already under way and will serve the farmers' mutual distribution system on Hood Canal.

It will take between two and three years to complete the second unit, Commissioner Davisson states. J. L. Stannard, chief engineer for the first unit, will continue in that capacity on the second.

## Plans for the Augmentation of Seattle Power

The City Council of Seattle is preparing to authorize an expenditure of an additional $5,000,000 in the Skagit hydro-electric development on one of two plans which are now before that body. One, introduced by Councilman Oliver T. Erickson, which has the backing of the majority of the Council, authorizes a contract with the Ambursen Dam Company for plans for a dam at Hanging Rock and paves the way for what has been known as the Hanging Rock program. The other plan, backed by the minority group in the Council and proposed by Councilman W. T. Campbell, calls for immediate construction of a power house at Diablo Canyon. This latter plan has the backing of both City Engineer C. W. Morse and Superintendent of Lighting J. D. Ross, Mr. Ross declaring that the Diablo development can be completed at a cost of $35 a kilowatt, whereas the Hanging Rock development will cost $100 a kilowatt. The Diablo plan provides for immediate installation of a third generator, 50,000 hp., in the present Gorge power house; construction of a complete power plant at Diablo Canyon, where a dam is now in process of construction, this plant to have two complete generating units of 50,000 hp. each; construction of a power tunnel, approximately 1,800 ft. long, extending from the Diablo Dam to the power house, to be built at Reflector Bar, below the Diablo Canyon; building of a transmission line from the Diablo power house to a connection at the Gorge power house with the existing transmission line to Seattle, and construction of a second main transmission line from the Skagit plant to the city of Seattle, a distance of 105 miles.

An award has been made to the Winston Brothers Company of Minneapolis, for construction of the Diablo Dam. The contract price was $2,546,338.

## Kentucky Utilities Men Show Pride in Work

*Hydro-Electric Achievements in State Praised—Problems of Industry Discussed—Former Governor Speaks in Appreciation of Electric Development*

WORK of untold benefit in conserving the natural resources of Kentucky has been done in the construction of power dams on the Dix River and at the Falls of the Ohio River, W. R. Power, president of the Kentucky Association of Public Utilities, said in opening the eleventh annual meeting of the association at the Brown Hotel, Louisville, on Wednesday, Jan. 18. The foresight of the Kentucky Utilities Company, builders of the Dix River dam and plant, and of the Louisville Gas & Electric Company, owners of the Ohio River Falls project, was praised. Another point touched upon by Mr. Power was the fact that engineering and technical matters which for years occupied most of the time of association meetings have become standardized, until the more interesting problems now are in the commercial department or in the development and growth of the industries.

Tom Wallace, chief of the editorial staff of the Louisville *Times*, speaking on rural electrification, urged the utility men to give more aid to the farmers in solving their problems. Dean F. Paul Anderson of the College of Engineering, University of Kentucky, said "no group of men in America have meant more to the remarkable economic progress of the United States in the last few years than the public utility men." Miss Esther Rockey, Dayton, Ohio, chairman of the women's division of the East Central Division, N.E.L.A., reported on the growing number of light and power companies which have organized home service departments. Addison W. Lee, general superintendent of the Louisville Gas & Electric Company, urged public utility managers in the state to do all in their power to eliminate radio interference which originates in their plants or along their lines. Important betterment of public relations can be brought about through the attitude of the companies in this matter, he said. A. B. Sawyer, president Farm Bureau, St. Matthews, Ky., held that development of power on the farm was largely a question of the ability of the farmer to finance it.

N. H. Dosker, vice-president Louisville National Bank & Trust Company; F. W. Rodenheber, manager Louisville Safety Council; Prof. John B. Troxwell of the University of Louisville, and W. H. Lovejoy, Louisville Water Company, spoke at the closing session on Thursday.

The business sessions drew gatherings of about a hundred, but more than 400 persons attended the annual banquet, visitors including Mayor Harrison of Louisville, state, city, county and federal officials. Ex-Governor Edwin P. Morrow, a member of the Federal Railway Wage Arbitration Board, and Lucius S. Storrs managing director of the American Electric Railway Association, New York, were the speakers.

Mr. Morrow praised the development of natural resources by the electric light and power industry. He expressed a desire that scenic beauties be retained, but urged that electric development in Kentucky be continued, to allow the state to take its rightful place as a great source of power.

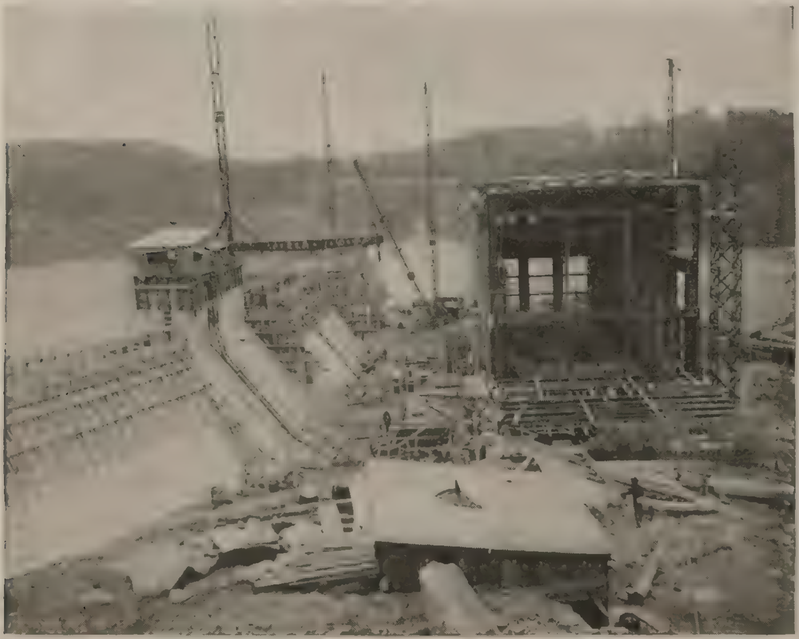
Samuel Riddle, vice-president of the Louisville Railway Company, was elected president of the association. Other officers named are: Vice-presidents, W. H. Harton, general manager of the Cincinnati, Newport & Covington Railway Company, and L. B. Herrington, president of the Kentucky Utilities Company; secretary, E. F. Kelley, Louisville Railway Company, and treasuerer, A. A. Tuttle, Kentucky Utilities Company. Robert Montgomery, general sales manager Louisville Gas & Electric Company, was reappointed chairman of the Kentucky Committee on Public Utility Information.

## Hetch Hetchy Still Fights to Buy Distribution Plants

Final argument in the valuation proceedings instituted four years ago by the city of San Francisco in an effort to acquire for its Hetch Hetchy plants the Pacific Gas & Electric Company's and the Great Western Power Company's distribution systems within the city limits were presented before the State Railroad Commission of California on Jan. 20. Both sides received three months in which to file briefs and 30 days additional for replies. The commission has denied the motion of the two power companies to dismiss the proceedings, and it is expected the power companies will appeal to the courts on the ground of jurisdiction and constitutionality. In consequence a final decision on the valuation of the properties is not expected for many months.

Hetch Hetchy power is now delivered to the Pacific Gas & Electric Company, Newark, on contract. The companies' and the city's figures on the value of the distribution systems are very widely apart.

## Reconstruction of Upper Tallassee Plant in Alabama



THE above illustration shows the status of reconstruction of the Alabama Power Company's Upper Tallassee plant a few weeks ago. At this plant the old 30½-ft. dam is being raised to 56 ft. When complete the power house will contain two 24,000-hp. units. Generation will begin in June, 1928, if the present construction program is adhered to. This plant is on the Tallapoosa River and will have the advantage of the storage capacity afforded by the Martin Dam development completed in 1926. On Dec. 1 about 56 per cent of the concrete had been poured and 95 per cent of the excavation completed.

# Purchases and Mergers

*Baltimore Company May Buy Havre de Grace Competitor—U. G. I. to Acquire Wilmington Properties — Consolidation in the Dakotas—Georgia System for Foshay*

CONTROVERSY over light and power service in Havre de Grace and northern Maryland (see ELECTRICAL WORLD, Jan. 21, page 165) may be solved by the Consolidated Gas, Electric Light & Power Company of Baltimore purchasing the Harford County property of the Northern Maryland Power Company. "Negotiations for the purchase of the Northern Maryland's property are under way," President Wagner of the first-named company is quoted as saying, "but I cannot say when or if the deal will be completed."

The United Gas Improvement Company is to acquire a group of utilities centering in Wilmington, Del., and including the Delaware Electric Power Company and subsidiary electric power and traction corporations controlled by the American Electric Power Corporation. The deal involves the exchange of Iowa properties controlled by the U.G.I. Plans for expansion at Wilmington were outlined on Dec. 17 (page 1263).

Consolidation of the electric and power plants in fifty cities and towns in central and western South Dakota and about fifteen in the southern part of North Dakota with the properties of the Hughes Electric Company of Bismarck, N. D., has been announced by E. A. Hughes, controlling the Hughes Electric Company, and the owners of the Northern Power & Light Company of Mobridge, S. D. The Hughes company's power station at Beulah, N. D., will be tripled in capacity and the power to be furnished over the combined system will be generated there and at Mobridge, Mr. Hughes says. Interconnection of the two distributing systems will be begun at once.

Control of the Baker County Power Company, owning and supplying electric properties in Newton, Camilla and fifteen other Georgia towns, has been purchased by the W. B. Foshay Company of Minneapolis for the Public Utilities Consolidated Corporation of Arizona. The value is said to be in excess of $1,300,000. The main office of the company has been moved from Newton to Camilla.

Sale of a controlling interest in the Kentucky Power Company and the Maysville Public Service Corporation and their subsidiaries to the United Public Service Company of Chicago is announced by Barrett Waters, president of the Kentucky utility companies, who is quoted as placing the value of the companies taken over at more than $4,000,000.

According to local reports, several large power companies in the East and South will file bids for the Kinston (N. C.) electric light plant on or before Feb. 6. There has been, as previously reported, considerable effort to acquire this municipal plant, and bids of $611,000 and $630,000 were refused last year.

# Briefer News

New Interstate Line in the Carolinas Planned by Duke Power.—A high-tension line between Canton, N. C., and Greenville, S. C., is to be built by the Duke Power Company this year, according to a recent announcement. It will connect Greenville with the Pigeon River hydro-electric plant of the Carolina Power & Light Company, 50 miles or so distant.

Public Service Conference Meets in Augusta.—A public relations conference of the operating companies of the New England Public Service Company took place on Jan. 18 and 19 at Augusta, Me. George S. Williams, vice-president Central Maine Power Company, presided at the opening session, and the chairmen at other sessions were W. A. Buttrick, president Twin State Gas & Electric Company, Boston, and A. R. Schiller, vice-president Public Service Company of New Hampshire. Among the principal speakers were Martin J. Insull, Walter S. Wyman, J. Brodie Smith, J. B. Reynolds, Miss Sophia Malicki and W. S. Vivian.

Steamship "California" Put in Service. — Following builders' trials, the *California* — asserted to be "the world's largest" electrically driven commercial vessel—has sailed from Newport News, Va., to New York City and starts on its first voyage Jan. 28. She is due to arrive at San Francisco on Feb. 13, which will reduce the existing fifteen-day passage between New York and California by two days. The boat is completely electrified, including propulsion and auxiliaries, General Electric equipment being used. The main power plant consists of two marine-type steam turbines, each rated at 6,750 shaft-horsepower with a maximum capacity of 8,500 shaft-horsepower. Each turbine is directly connected to an alternating-current generator rated at 5,250 kw. and having a maximum continuous rating of 6,600 kw. There are two main propulsion motors, one directly connected to each propeller shaft, and each being of the synchronous induction type, rated at 5,250 kw.

A "Boulder Dam" Proposed for Nebraska. — Representative Shallenberger of Nebraska has introduced a bill at Washington to appropriate $20,000,000 to develop the combination irrigation and power plant on the Platte River in Gosper County which the State Legislature, at its last session, refused to authorize with the state as a guarantor of the bonds. He plans to tie it up with other river appropriations and schemes. The cost would be amortized over a period of fifty years and recouped out of the profits from the sale of water for irrigation and power. The bill follows the Boulder Dam proposal in its general lines, but also proposes that the profit from the sale of power shall be perpetually used to maintain the plant and repay the cost. Senator Howell of Nebraska has promised to support the project, but the plan has not met with favor in engineering circles because of the distance of the state's principal markets for electrical energy.

Bill for South Carolina State Hydro System Unfavorably Reported.—A bill introduced into the South Carolina Legislature which would sanction the development of water power by the state under a commission of five members, whose duties would include many other matters, including the duty "to pay the costs of government," has been unfavorably reported.

Line Extensions in Nebraska.—The Iowa-Nebraska Light & Power Company has been authorized by the Nebraska Railway Commission to make several extensions in southeastern Nebraska; the Interstate Power will build a line from south of Spencer, connecting the plant on the Niobrara River directly with the towns of Bristow and Lynch; the Central States is to connect Macy with its Walthill plant; the Nebraska Power is building a line from Valley to Le Shara and Yutan and extending its line at Meadows, while the Nebraska Electric is connecting its plants at McCook, Gothenburg and Lexington so that sufficient standby service will be available in emergencies. To add to its generating capacity at Lexington the last-named company is installing a large internal-combustion engine and a direct-connected generator.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

Iowa Section, N.E.L.A.—Roosevelt Hotel, Cedar Rapids, Feb. 2 and 3. H. E. Weeks, Davenport, Iowa.

American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16; St. Louis regional meeting, March 7-9. F. L. Hutchinson, 33 West 39th St., New York.

Rocky Mountain Division, N.E.L.A.—Albuquerque, N. M., Feb. 14-16. O. A. Weller, 900 15th St., Denver.

Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.

Iowa Power Conference—University of Iowa, Iowa City, Feb. 15 and 16. Joe Carmichael, Iowa Committee on Public Utility Information, 310 Crocker Bldg., Des Moines.

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21; Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.

New Mexico Utilities Association—Albuquerque, N. M., Feb. 20-22. Arthur Prager, Albuquerque Gas & Electric Company, Albuquerque.

Oklahoma Utilities Association—Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

Carrying New Line Over the Susquehanna at Harrisburg.—Another high-tension river crossing is progressing rapidly at Harrisburg, Pa., where the Harrisburg Light & Power Company is building a 66,000-volt line across the Susquehanna River to New Cumberland. This line is to extend from the company's plant in the southern end of Harrisburg west to Mechanicsburg and possibly to Boiling Springs. The largest of the three steel towers is being erected on an island in the river. It will be 320 ft. high and 60 ft. square at the base. The tower on the eastern side of the river will be 120 ft. high and that at the southern end of New Cumberland will be 155 ft. high. They will carry eight cables.

Interstate Power 9.06 per Cent of All Generated by Electric Light Companies.—The Bureau of Business Research of Harvard University has just published a study entitled "Interstate Transmission of Electric Light and Power Companies in 1926" and based on a nation-wide survey. The total quantity of electricity transmitted across state lines, as reported to the bureau, aggregated 6,171,530,837 kw.-hr. in 1926, exclusive of power crossing the Canadian or Mexican boundaries. This is approximately 9.06 per cent of the total generated by all electric light and power companies in the country. Of all interstate power 26.28 per cent involved no change in ownership, according to the bureau's report. In 1926 there were in operation 453 interstate power lines. Of these 152, or 33.6 per cent, were placed in operation in the years 1924, 1925 and 1926.

Puget Sound Power & Light Has Five-Million-Dollar Budget.—The Puget Sound Power & Light Company, Seattle, through its vice-president, W. H. McGrath, announces that $5,000,000 will be spent in 1928 for construction and extensions. Included in this amount is an item of $1,267,000 covering cost of a new unit at the Baker River power plant, together with the necessary addition to the power house. The sum of $787,000 is provided for a transmission line from the Baker River plant to the Beverly Park station; line extensions for new customers will cost $1,652,000, and increasing the capacity of old substations and building new ones represent a proposed investment of $618,400. At least ten thousand families will be served with electricity who have not before had this convenience. Seventy-two hundred rural customers were added in 1927.

Hydro Project for Genesee River at Letchworth Park in New York.—In its first annual report, just issued, the Division of Water Power and Control of New York State reports two applications for approval of water-power projects as received last year. One was from the M. B. Light & Power Company (now owned by the Associated Gas & Electric

Company) for surplus canal waters at Eaton, and negotiations for a license are still in progress. The other application came from the Commonwealth Power Company for a project on the Genesee River near Portage. The company contemplated constructing a high concrete dam across the river, creating a lake 17 miles long, and installing capacity totaling 140,000 hp. at the lowest of the three falls in Letchworth Park. The Letchworth Park Commission now has the merits of the plan under consideration.

INTERSTATE QUESTION INVOLVED IN RAISING BELLOWS FALLS DAM.—When the Bellows Falls (Vt.) Canal Company made application recently to the Vermont Public Service Commission for permission to condemn land as a preliminary to raising its dam in the Connecticut River 11 ft., it was disclosed that under an agreement between the canal company and the New Hampshire Public Service Commission the former would be bound to deliver to New Hampshire as much of the additional electricity generated through raising the dam as the New Hampshire commission might order, or even the total amount. On this account the Vermont commission would not sanction the condemnation proceedings. Three courses are left open to the company: It can seek a modification of the New Hampshire agreement, it can buy the land by bargain with the owners, or it can abandon the scheme.

ROGUE RIVER PLANT OF CALIFORNIA-OREGON STARTS UP ONE YEAR AFTER CONSTRUCTION BEGAN. — The first 16,000-kw. unit of the 48,000-kw. Prospect No. 2 development of the California-Oregon Power Company, under construction on the North Fork of the Rogue River, Oregon, was placed in service on Jan. 11, and trial runs on the second unit, which is of the same rating, were started on Jan. 18. Actual work of construction began on Jan. 24, 1927, and work during the first few months was carried on under the most adverse conditions, heavy snows being followed by a prolonged rainy season. The third unit will be installed when the need for additional power becomes apparent. Prospect No. 2 is tied in with Prospect No. 1 station, which is served by the same canal. The new plant called for the construction of 70 miles of 132-kv. line and 6 miles of 66-kv. line between Prospect and Medford, Ore.

BACKUS EXPOUNDS HIS INTERNATIONAL HYDRO PLANS.—The first authorized statement made public in regard to the proposal now before the International Joint Commission for a construction of a series of storage dams in the Lake of the Woods district, which lies just on or above the boundary line between Minnesota and western Canada, has just been issued by E. W. Backus of Minneapolis. The Backus-Brooks company has proposed the construction of reservoir dams at Basswood, Saganaga and Crooked Lakes and at Lac La Croix. The company also proposes to increase the height of the dam already built at Rainy Lake, which would provide storage for a total of 120,000,000,000 cu.ft. of water above the present Rainy Lake and Namakan chain of lakes. The statement declares that about 100,000 additional hydro-electric horsepower can be developed in the area, of which 50,000 hp. can be used in Minnesota. Mr. Backus and his associates are waiting for the final reports of the engineers of the International Joint Commission before they can determine to what extent, if any, their plans should be modified. They will then be prepared to urge their case before the commission.

# Commission Rulings

JUSTIFICATION OF METER DEPOSITS IS DUTY OF UTILITY.—The burden of justifying a meter deposit was said by the North Dakota Board of Railroad Commissioners to be upon the utility company proposing such a charge where a protest against it was made, and the fact that a meter deposit was in effect in numerous places in the state was not conclusive as to its necessity or reasonableness in all cases. The rules of the commission provided that a utility might require from all consumers or prospective consumers, subject to approval of the commission, a cash deposit, but the commission ruled that it was not therefore mandatory upon a utility to require a meter deposit in every instance. The fact that the majority, if not all, of the consumers of a company owned their meters was said to raise a question in the minds of the commission as to the propriety of the charge. Furthermore, in the case under review, which affected the Hughes Electric Company, the record was conspicuously silent as to the reasonableness of the charge proposed.

CAPITALIZATION OF EXCESS PRICE PAID FOR PROPERTY REFUSED. — The Illinois Power & Light Company asked the Illinois Commerce Commission for permission to buy the Maroa Electric Light Company for $60,000. The commission valued it at only $35,000, but authorized the sale with the proviso that the price paid should not be taken as a basis for rate making. It was required further that the sum in excess of what the commission deemed to be reasonable value should be charged neither to operating expenses nor to capital account, but should be amortized or wiped out at the expense of the stockholders. The commission said: "Under the present method of financing, most public utilities have a wide distribution of securities among consumers, and the imposition of conservative capitalization performs a twofold service to those ultimately affected," implying that excessive stock issues may indirectly affect consumers by impairing the company's credit, while as stockholders they would, of course, be directly affected. The commission aimed, therefore, at protecting the interests both of rate payers and of future stockholders.

# Recent Court Decisions

BURDEN RESTS ON THOSE SEEKING SPECIAL RATES TO SHOW THAT THOSE SET BY COMMISSION ARE UNJUST.—The Supreme Court of Oklahoma has sustained the Corporation Commission of that state in refusing to make special rates for natural gas applicable to a zone comprising the city of Tulsa (Tulsa Tribune Company vs. Oklahoma Natural Gas Company). The court found the presumption to be that the commission's refusal was just and reasonable and held that the appellant had failed in its endeavor to demonstrate the contrary. (261 Pac. 213.)*

DUTIES OF UTILITY SERVING PATRONS AT SUMMER RESORT.—Although a utility company serving a summer resort has the right to enforce reasonable regulations and decline to furnish service unless these are observed, light and water service may not be cut off to enforce a disputed claim or a collateral liability. For this reason the owner of the utility serving Macatawa Park, Mich., was rightly found culpable in discontinuing service to a patron merely because he refused to install a septic tank, and an award of $1,000 damages to the customer, whom the action of the company prevented from renting cottages owned by him, was not excessive. So found the Supreme Court of Michigan in Ten Broek vs. Miller. (216 N.W. 385.)

INDUCTIVE INTERFERENCE BY POWER COMPANY'S LINES WITH MACHINE TRANSMISSION OF MESSAGES BY TELEGRAPH COMPANY NOT A NUISANCE.—The Postal Telegraph-Cable Company brought suit for damages against the Pacific Gas & Electric Company on the ground that "there extends in all directions" about the latter company's 53,000-volt transmission line from Sacramento to Suisun "a field of force for more than 210 ft., and said field of force carries within such field many electric currents of high and varying intensity which are not controlled by or confined to said power lines" and are "inducted onto plaintiff's lines, thereby interfering with the transmission of telegraphic messages thereover," and that "the physical damage to plaintiff's said line and the equipment thereof from such surges and induction within three years last past has amounted to the sum of $2,000." This, the plaintiff contended, constituted a nuisance in the statutory sense, but the Supreme Court of California, sitting *en banc*, has sustained the lower court in finding to the contrary and denying the right of action for damages. The interference alleged was specifically with machine transmission, and the power company made the point that this was an extraordinary use of the plaintiff's property and therefore not subject to the same considerations as inhere in ordinary use. The plaintiff's further charges against the power company of negligent construction and failure to keep lines in repair were dismissed by the court as too general and insufficient to be sustained against demurrer. Five judges concurred in this part of the decision, but two of the five dissented from the first part, holding that a nuisance had been shown to exist. (260 Pac. 11[illegible]

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# News About Men of the Industry

**Howard Bardwell**, assistant to the general superintendent of the Empire District Electric Company in the production department, has been appointed head of a newly created division dealing with compensation insurance, employees' safety and personnel problems. In connection with the appointment he has been relieved of his duties in the production department. Mr. Bardwell has for the past three years handled most of the problems arising from employees' compensation and safety and personnel work. The volume of this work has grown to such an extent that it is felt that he can profitably give his entire time to it. Mr. Bardwell has been with the organization nine years. He joined the results department at the Riverton plant early in 1919, but was transferred to the Joplin office in 1922.

H. C. **Blackwell**, president of the Union Gas & Electric Company, Cincinnati, has been elected president of the Cincinnati Chamber of Commerce. Mr. Blackwell served for several years as chairman of the industrial committee of the chamber. He has been in Cincinnati since 1924, when he transferred his interests from Kansas City (Mo.), where he had been vice-president and general manager of the Kansas City Power & Light Company.

**Edward M. Graham**, Bangor, Me., president of the Bangor Hydro-Electric Company, has been elected president of the Eastern Manufacturing Company, which operates mills at Lincoln and South Brewer, Me., in the manufacture of sulphite pulp, writing paper and rayon cellulose, to succeed Stewart Webb of Boston, Mass.

**Theodore Dienst**, for the past several years superintendent of the Kansas Electric Power Company at Parsons, has been appointed manager of the McAlester division of the Southwest Power Company to succeed H. T. Asbury, who has assumed new duties in Arkansas.

E. T. **Hughes**, for eight years manager of the Yankton (S.D.) division of the Northwestern Public Service Company, has been appointed superintendent of the Kansas Electric Power Company at Parsons to succeed Theodore Dienst, who has assumed new duties in Oklahoma.

**Glenn C. Kiley**, formerly service manager of the Oklahoma Gas & Electric Company, Oklahoma City, has been appointed local manager of the company in that city and in that capacity will supervise local matters in Bethany, Moore, Britton, Choctaw, Harrah, Jones and Yukon as well as in Oklahoma City. Mr. Kiley entered the employ of the Byllesby Company in Chicago in the rate and valuation department in 1917, removing to Oklahoma in the summer of 1923. He started with the Oklahoma Gas & Electric Company as a traveling auditor and three years ago was appointed service manager, the position he occupied until his recent assignment to the local managership.

## F. H. Woodward Leaves San Francisco

F. H. Woodward, since 1922 general sales manager of the Great Western Power Company, with headquarters in San Francisco, has been transferred to Oakland as manager of that division of the company. The position of general sales manager in the San Francisco office has been abolished. He is succeeding G. W. Bernhard, who has been made industrial heating engineer with headquarters in San Francisco. Mr. Woodward is returning to a territory by no means unfamiliar to him, he having served as manager of the Oakland division from 1912 to 1922. He has been connected with the company for the past eighteen years, having entered its employ in 1909 in charge of industrial power sales.

F. H. WOODWARD

**Harold T. Melhuish** has joined the staff of the National Electrical Manufacturers Association as director of the radio division. Mr. Melhuish was formerly connected with the Radio Corporation of America for five and a half years, serving successively as special field representative, district sales manager, assistant general sales manager and manager of sales administration.

J. V. **Gongwer** has been named chief assistant engineer for the proposed construction of the second unit of the Cushman power project by the city of Tacoma. Mr. Gongwer will occupy the position of superintendent of hydraulic design and construction.

**James F. Small** has been appointed merchandise sales manager of the Public Service Company of Northern Illinois. Mr. Small was formerly manager of the Chicago Heights Gas Company, now a part of the Public Service company. He first entered the utility business with the Peoples Gas, Light & Coke Company and later affiliated himself with the Western United Gas & Electric Company as district manager. After considerable experience as a consulting and operating engineer, he became manager of the Chicago Heights Gas Company in 1917 and held that position until 1926, when that organization became a part of the Public Service company's system.

**Herman Russell**, vice-president of the Rochester Gas & Electric Corporation, has been elected president of the Rochester Chamber of Commerce. In addition to his executive position with the Rochester Gas & Electric Corporation, Mr. Russell is an officer and director in numerous Rochester banks and other organizations and has always given liberally of his time and energy in the interest of the public welfare.

E. J. **Jones**, for the past fifteen years manager of the Florida Power Company, Ocala, Fla., and its successor, the Florida Power Corporation, has been appointed general manager of the Compañia Electrica de Santo Domingo. This company operates the electrical utilities in the cities of Santo Domingo, Macoris and other cities in the Dominican Republic.

H. P. **Jones** has been appointed superintendent of meters of the Oklahoma Gas & Electric Company and C. E. **Bathe** has been named superintendent of electrical standards and radio. W. K. **Danvers** has been made superintendent in charge of the maintenance and reclamation department recently established.

**Dr. Thomas S. Baker**, president of the Carnegie Institute of Technology, Pittsburgh, is planning to spend six weeks in Europe during February, March and April, to organize plans for the second international conference on bituminous coal at Pittsburgh.

**Carroll A. Dean** has been appointed merchandising manager of the Lawrence (Mass.) Gas & Electric Company. Mr. Dean was formerly in charge of electric appliance sales for the Lowell Electric Light Corporation, Connecticut Light & Power Company and Cambridge Electric Light Company.

R. J. **Malcomson**, formerly street lighting engineer of the Public Service Company of Northern Illinois, in charge of municipal street-lighting sales, has been appointed manager of lighting sales. He is now responsible for both the general and municipal lighting sales of the company. Mr. Malcomson became associated with the company in 1923 in the capacity of sales engineer and in 1924 was appointed street lighting engineer, which position he held until his present assignment.

Leon O. Whitsell has been elected president of the California Railroad Commission to succeed Ezra W. Decoto, retired. President Whitsell has been a member of the railroad commission since 1925 and was reappointed for a full term of six years by former Governor Friend W. Richardson, Jan. 1, 1927. He was appointed from Orange county, where he was a member of the board of supervisors, and a leading figure in the citrus industry of that county. He was a practicing attorney for many years before engaging in citrus growing in southern California.

L. S. Small has resigned as superintendent of distribution for the Pine Bluff district of the Arkansas Power & Light Company, with which company he had been connected for three years. R. J. Rhinehart, who has been affiliated with the company for about a year, has been appointed to succeed Mr. Small. Mr. Rhinehart was formerly superintendent of service for the Southwestern Gas & Electric Company at Texarkana.

George E. Hardy, president of the Commonwealth Power Corporation, sailed for Bermuda Jan. 25 for a short vacation.

C. D. Porter, vice-president and general manager of the Virginia Public Service Company, successor to the Newport News & Hampton Railway, Gas & Electric Company, has resigned to become vice-president and general manager of the Omaha & Council Bluffs Street Railway Company, Omaha, Neb. Mr. Porter has been vice-president and general manager of the Newport News utility since 1921.

C. S. Van Dyke has been appointed rate engineer for the New York Power & Light Corporation in charge of all matters pertaining to rates, both gas and electric, including the compilation and tabulation of rate information, maintenance of records and the study of new rates. Mr. Van Dyke's headquarters will be in Albany.

B. L. Delack, assistant manager of the Schenectady works of the General Electric Company for the past year, has been appointed manager of that plant. Mr. Delack has been associated with the company since 1903 and just prior to his connection at Schenectady he was affiliated with the Erie works.

Samuel Insull, president of the Commonwealth Edison Company, Chicago, has been elected president of the Western United Gas & Electric Company, recently acquired by the Insull interests.

E. A. Wagner has been appointed manager of the Pittsfield (Mass.) plant of the General Electric Company.

Thomas H. Blodgett, president and chairman of the board of directors of the American Chicle Company, has been elected a director of the American Water Works & Electric Company and its subsidiary, the West Penn Electric Company.

J. B. Archer, district manager of the Iowa-Nebraska Light & Power Company at Shenandoah, Ia., has been transferred to the general office at Lincoln. C. C. Helmers of Lincoln will be located at Shenandoah temporarily as manager.

T. H. Hogg, chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario, was recently made the recipient of the honorary degree of doctor of engineering by the University of Toronto.

J. F. Owens, vice-president and general manager of the Oklahoma Gas & Electric Company, has been elected first vice-president of the Oklahoma State Chamber of Commerce.

E. A. Feldtkeller, who for several months has been supervisor for the General Engineering & Management Corporation in the Florida sector, has been promoted to the general managership of the Jersey Central Power & Light Company, southern division, and has taken up his duties at the division headquarters in the company's offices at Asbury Park, N. J.

Paul Fasoli, formerly superintendent of the Associated Gas & Electric interests at Granville, N. Y., has assumed the duties of general superintendent of the Harlem Valley division, succeeding L. A. Reinhardt, who has been transferred to Ithaca.

J. H. Van Aernam has been appointed manager of merchandise sales for the New York Power & Light Corporation with headquarters in Albany. Mr. Van Aernam will supervise all activities in connection with merchandising operations.

C. E. Lyon has been appointed superintendent of hydro stations for the New York Power & Light Corporation and will have charge of all hydro stations belonging to the corporation.

C. C. Yeakley has been appointed superintendent of the Oklahoma City district, western division, of the Oklahoma Gas & Electric Company.

## Obituary

William E. Gilmore, for many years general manager of the Thomas A. Edison industries and in more recent years president of the Essex Press, a publishing house of New Jersey, died Jan. 17 at St. Mary's Hospital, Orange. A native of New York, Mr. Gilmore became identified with the Edison Electric Light Company at the age of eighteen. While with Mr. Edison, in addition to holding the position of general manager, he became president and general manager of the National Phonograph Company. Prior to his association with Mr. Edison directly, Mr. Gilmore in 1886 removed to Schenectady to become assistant secretary of the Edison Machine Works, which subsequently became part of the Edison General Electric Company, the forerunner of the General Electric Company. He was appointed assistant general manager of the Edison General Electric Company and in 1894 Mr. Edison called him to West Orange.

Charles S. Northcutt, manager of the San Joaquin division of the Pacific Gas & Electric Company, died Dec. 17 of injuries received in an automobile accident. Though a native of Georgia, Mr. Northcutt had been a resident of California since 1905. For four years he engaged in construction work and then became identified with the executive offices of the Sierra & San Francisco Power Company. In 1910 he was appointed agent in Modesto and one year later manager of that district. When, early in 1920, the Sierra & San Francisco Power Company was leased by the Pacific Gas & Electric Company, Mr. Northcutt was appointed manager of the Stanislaus district. Six years ago he was promoted to the position of manager of the San Joaquin division, comprising the Stanislaus, San Joaquin, Tuolumne and Electra districts.

Richard J. Dibowski, secretary and director of the Wadsworth Electrical Appliance Manufacturing Company of Covington, Ky., died suddenly Jan. 8 at his home in that city. Mr. Dibowski was one of the founders of the Wadsworth organization and during the period of its growth contributed substantially to its progress. His interest in civic and business affairs led to his appointment as a director of the Associated Industries of Kentucky. Mr. Dibowski was 53 years of age.

Allen H. Moore, who retired six months ago as chairman of the standardizing committee of the General Electric Company on account of ill health, died Jan. 10 at his home in Albany, N. Y., in his 62d year. At the time Mr. Moore relinquished his duties he had to his credit 39 years of service with the General Electric Company and its associated foreign manufacturing companies.

Augustus T. Holbrook, electrical engineer, died in New York, Jan. 12. Mr. Holbrook was for several years identified with the electrical industry in New England, later having removed to New York. He was a member of the American Institute of Electrical Engineers.

# Financial and Statistical News

## *Rediscount Rate Change Markets Again Active Common Stocks Move Up*

SPECULATION with regard to the possible effect upon the security markets of the rise to 4 per cent of the Chicago rediscount rate soon had its answer in a corresponding tightening of money in the New York market. Stocks reacted from two to five points, but utility stocks were the only main group not materially affected. Prices were maintained with negligible losses.

While the Federal Reserve rediscount rate charge in Chicago need not have any immediate effect on the New York money market, the present situation implies a policy rather than an isolated rate adjustment in one locality. There is the imminent possibility of a rise in the other reserve districts and in any event, the board has a rather forceful, if indirect, check upon speculative activities in the rediscount rate.

After last week's hesitation and temporary selling movement in the markets at large, the trend of power and light stocks is again upward, in utter disregard, apparently, of the Walsh Resolution. American Gas & Electric is up to 124; Brooklyn Edison is up 13 points during the week, to 226; Middle West Utilities gained 5 points to 134. Several other common stocks including Public Service of New Jersey, Southeastern Power & Light, Philadelphia Electric, etc., made smaller gains.

## New German Loan Offered

The twenty-million-dollar loan of the Westphalia United Electric Power Corporation, which last week's issue of ELECTRICAL WORLD announced would be offered in the near future, was brought out Monday in the form of first mortgage 6 per cent sinking fund gold bonds, series A. These securities, due Jan. 1, 1953, were priced at 92¾ and accrued interest, to yield about 6.60 per cent. Proceeds will be applied to the payment of bonds and of floating debt incurred for capital expenditures and for additions and improvements to the properties of the corporation and its subsidiary companies.

## Standard Gas Customer Sales Total $32,000,000

Customer-ownership sales of preferred shares of the subsidiary and affiliated public utilities of the Standard Gas & Electric Company established a new high record in 1927, when sales (par value) totaled $31,975,600, an increase of 27.58 per cent over the previous high record in 1926. There were 42,267 separate transactions. The total represents all sales, less only cançellations. Of this amount, repurchases totaled 13.24 per cent, leaving a total of net sales from treasury of $28,236,900. It is estimated that approximately 22,000 new shareholders were added to the subsidiary and affiliated companies through the operation of the customer-ownership plan in 1927. A total of 9,200 customer shareholders must be deducted because of the merger of the Western States Gas & Electric Company and the Coast Valleys Gas & Electric Company with the Pacific Gas & Electric Company. Therefore, the net gain amounted to 12,800 shareholders.

# November Operations Swing Upward

### Electric Light and Power Revenue, $158,000,000—Is 6.5 per Cent Above Last Year—Energy Generated Increases 7.2 per Cent —Both Show Gain Over October

WITH a revenue of $158,000,000, estimated for the entire industry on the basis of reports received by the ELECTRICAL WORLD, and an energy output of 6,503,442,000 kw.-hr., corresponding to a daily average of 217,000,000 kw.-hr., the electric light and power companies in the United States reached the highest figure ever attained as to the latter item and earned the highest monthly revenue with one exception. The earnings were 6.5 per cent above those of November, 1926, and 4.8 per cent higher than in October, 1927. With two months still to go they missed the midwinter peak attained in January, 1927, by less than 3 per cent.

These returns seem to indicate the setting in of an upward movement, though one not yet strongly defined. For the first half of 1927 the revenue exceeded that for the corresponding portion of 1926 by 10.5 per cent. This fell to 7.2 per cent in July, rose slightly in August to 7.3 and in September to nearly 9 per cent, then in October fell to 6.3 per cent. The November earnings thus represent a slight acceleration compared with October business.

Had the growth in revenue continued at the same rapid rate as during the five years from 1922 to 1926 the average daily revenue would have been $5,370,000. The actual revenue, therefore, fell

*Data on "energy generated" are those collected and published by the United States Geological Survey for all public utilities minus such data as are collected on energy generated by electric railway companies, reclamation service and manufacturing plants. The data are, therefore, for the electric light and power industry only

short of the normal, computed on that severe basis, by only 2 per cent.

Operating expenses increased less than revenue; the net earnings, therefore, make a more favorable showing than the gross; compared with the corresponding months of 1926 they were greater by 9.5 per cent in October and 9.6 per cent in November.

The gain in energy output, as in revenue, was greater than in October, rising to 7.2 per cent above the output in November, 1926. More of the increase was borne by water power than by steam. The former grew by 12 per cent, while fuel-generated energy was only 4.5 per cent greater than a year before. Water power produced 2,456,835,000 kw.-hr., or 38 per cent of the whole.

TABLE II—OPERATING RATIO OF CENTRAL-STATION COMPANIES

| Month | Operating Ratio | | | | | |
|---|---|---|---|---|---|---|
| | Steam Plants | | Hydro Plants | | Combined Hydro and Steam Plants | |
| | 1927 | 1926 | 1927 | 1926 | 1927 | 1926 |
| Aug | 52.8 | 53.6 | 34.6 | 36.3 | 44.1 | 45.8 |
| Sept | 48.8 | 49.7 | 33.4 | 37.5 | 42.1 | 43.3 |
| Oct.. | 46.9 | 48.3 | 31.8 | 32.4 | 42.6 | 43.9 |
| Nov.. | 44.7 | 45.8 | | | | |

Although the proportions of coal, oil and natural gas consumed differed slightly, the aggregate in terms of equivalent tons of coal was almost identical in November, 1926, and the same month in 1927. The increase in output was thus achieved without an increase in fuel consumption.

Energy purchased for resale has varied only a few per cent since August and was only 6 per cent greater in November than it was a year earlier.

## Pacific Power and Light Announces Refinancing

The incorporation of a new Pacific Power & Light Company to include not only the old company but seven smaller companies, as announced in the Jan. 21 issue of ELECTRICAL WORLD, will necessitate the retirement of $9,119,000 of the old company's 5 per cent. first and refunding mortgage bonds, due April 1, 1930, which will be accomplished by call on an interest date at the call price of 102. A new issue of first mortgage bonds of the new company, in the amount of $17,000,000, will then be sold. Details have not been determined, but a coupon rate of 5 per cent or less, with a long term, is expected.

The outstanding 57,934 shares of 7 per cent, $100 par, cumulative preferred stock of the present company will be exchanged share for share with an identical stock of the new company, and in addition there will be issued 12,216 shares of $6, no-par, cumulative preferred stock for sale to the public as and when needed by the company. Both of these stocks will carry first preferred privileges as compared with the other junior securities of the company. Behind these issues will be 40,000 shares of $6, no-par, second preferred stock and an undetermined quantity of no-par common stock, which will be taken by the American Power & Light Company as reimbursement for advances made by it to the Pacific company and in payment of properties now owned by it but turned over to the new Pacific company. The absorption of the new properties will add about $15,000,000 of physical assets to the company, bringing the total assets up to about $40,000,000.

*As collected by United States Geological Survey. The data are for the electric light and power industry only.

## Baltimore Consolidated Leads New Capital Issues

During the week ended Jan. 26 the Consolidated Gas, Electric Light & Power Company of Baltimore issued 5 per cent cumulative preferred stock, series A, to the amount of $10,000,000, the price being 100 and accrued dividend. The issue totaled $13,500,000, but $3,500,000 of that sum was reserved by the company for local subscription. The proceeds of the offering will be used to provide funds, in part, for the retirement of $5,000,000 series A 8 per cent, $2,000,000 series B 7 per cent and $4,000,000 series C 6½ per cent cumulative preferred stocks, which issues will be redeemed April 2, 1928, and to reimburse the treasury in part for the cost of additions and extensions and for other capital expenditures.

The Central States Utilities Corporation offered ten-year 6 per cent secured gold bonds to the amount of $3,000,000, the price being 90 and accrued interest to yield about 6.25 per cent. The Central States Utilities Corporation will own all of the outstanding common stock of the Central States Power & Light Corporation.

First mortgage gold bonds of the Washington Gas & Electric Company were offered at 100 and accrued interest.

## National Power & Light And Lehigh Power Merge

S. Z. Mitchell, president of Electric Bond & Share Company stated this week that a plan has been formulated for the exchange of stock of Lehigh Power Securities Corporation for stock of National Power & Light Company. He said that the basis of exchange is one share of $6 preferred stock of the National Power & Light Company for each share of $6 preferred stock of the Lehigh Power Securities Corporation, and one share of the common stock of the National Power & Light Company for each share of the common stock of the Lehigh Power Securities Corporation, and that this privilege of exchange is extended to all stockholders of Lehigh Power Securities Corporation.

Mr. Mitchell stated that while the two companies are remarkably similar as to amount of earnings and share capitalization the character of the business in the communities served by the two groups is quite different. In his opinion, the Lehigh Power Securities Corporation stockholders making the exchange, as well as the stockholders of the National Power & Light Company, will benefit substantially by the business and geographic diversity and the greater financial strength and stability resulting from the union of the two groups.

## New Italian Superpower Corporation Organized

Under Delaware laws, the Italian Superpower Corporation has been organized with the purpose of acquiring substantial but not controlling interests in virtually all of the principal electric light and power companies in Italy. As a result of the progressive measures put into effect in recent years, Italy has started a remarkable development of her hydro-electric resources, and with the modern adaption of electricity to practically every line of industry and the assistance of American capital further phenomenal growth along these lines is expected in the future.

The first piece of financing for Italian interests to appear in the American investment markets since the placing of the embargo on foreign loans by the Italian government followed the announcement of the formation of the new company. Thirty-five-year 6 per cent debentures of the Italian Superpower Corporation were offered at 100 and accrued interest to the amount of $20,250,000. Common stock and option warrants were attached. These debentures will be followed by 124,172 shares of preferred stock and 970,000 shares of common stock class "A" (including 202,500 shares to be deposited with the Bankers Trust Company, New York, in connection with the option warrants to be outstanding) and 150,000 shares of common stock class "B."

L. K. Thorne, president of Bonbright & Company, Inc., and chairman of the American Superpower Corporation, is chairman and president of the Italian Superpower Corporation. The management will include officials of many large American utilities. In addition to Mr. Thorne the directorate includes: S. Z. Mitchell, Gerard Swope, C. H. Minor, E. P. Currier, Marshall Field, P. G. Gossler, J. W. Maitland, B. C. Cobb, C. E. Calder, Giuseppe Toeplitz, Silvio Crespi, Ettore Conti, Guido Donegani, Siro Fusi, Achille Gaggia, Rinaldo Panzarasa, Pasquale Simonelli, Michelangelo Facconi and Guido Semenza.

---

**Worcester Utility Increases Dividend.**—Directors of the Worcester Electric Light Company have declared a quarterly dividend of $1.50 a share, or 6 per cent, on the $25 par stock. This puts the stock on a regular $6 basis, as compared with a $4 basis previously in effect. Last year, in addition to the regular $4 dividend, the company paid an extra dividend of $1.50 to shareholders.

## Handbook on International Commercial Arbitration

The publication is announced by the American Arbitration Association of a new International Handbook on Commercial Arbitration by the International Chamber of Commerce. This publication has been made possible through the co-operation of the International General Electric Company and the American Arbitration Association in honor of the late Anson W. Burchard, first president of the American Arbitration Association and chairman of the board of the International General Electric Company. The commercial arbitration procedure for each country will be described first in separate pamphlet form, in order to be readily available to business men engaged in foreign trade with such countries. The first instalment of the handbook describing "Commercial Arbitration under Swiss Law" has just been published. When the brochures for all countries are issued they will be combined and published in bound volume form as a complete manual on the commercial arbitration laws of the world.

Louis K. Comstock, chairman of the arbitration committee of the American section of the International Chamber of Commerce and a director of the American Arbitration Association, commenting upon the importance of this publication to business men engaged in international trade, said:

"The publication in condensed form of the requirements of the commercial arbitration laws of the world and of the procedure thereunder, which will greatly facilitate the practice of arbitration in the settlement of such business misunderstandings as may arise in the course of international trade, was a project which Mr. Burchard had very much at heart. Hereafter when the American importer or exporter has a dispute with a business man in a foreign country and he wishes to settle by arbitration, he will know exactly what must be done under the requirements of the arbitration law of the country in which the arbitration is to be held and precisely what his rights and obligations may be. Now, because of the lack of such condensed and readily available information, the uncertainty regarding these requirements frequently discourages a reference to arbitration. The same information is being published in English, French and German."

---

# 1927 Production Operations Show 2 per Cent Increase

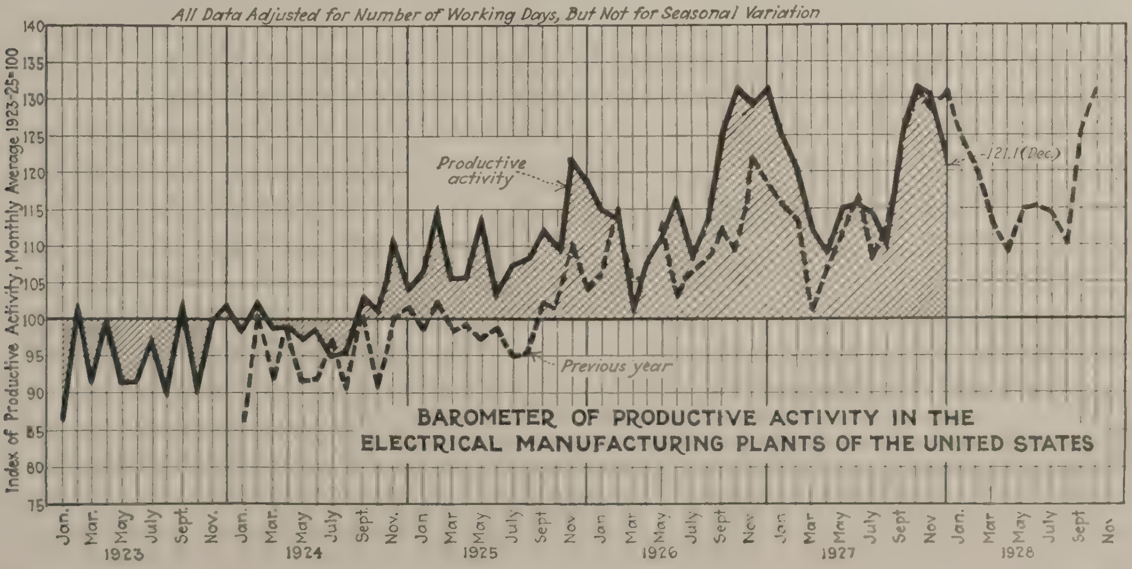
### Electrical Manufacturing Industry, However, Closed Last Year on a Plane 7.8 per Cent Under Year Previous—Gains Confined to First Half of the Year

WHILE the year just closed did not record the greatly increased productive operations in the electrical manufacturing plants of the nation witnessed during 1926, yet it did witness an increase in operations for the year as a whole of 2 per cent over the preceding twelve months. This gain in activities was confined almost exclusively to the first half of the year, operations since July being about on a level with or under the same period in 1926. The year 1927 closed with the rate of operations on a plane 7.8 per cent under December, 1926, the greatest twelve-month comparative drop in activities witnessed since 1923. The slight upturn in operations reported in December, 1926, did not take place last December.

The index of activity in the electrical manufacturing industry based on consumption of electrical energy stands at 121.1 for December as compared with 130.4 for November and 131.7 for December, 1926. Comparative indexes of productive activity, referred to the average activity for the period 1923-25 as 100 and adjusted for number of working days, are as follows:

| | |
|---|---|
| December, 1927 | 121.1 |
| November, 1927 | 130.4 |
| October, 1927 | 131.3 |
| December, 1926 | 131.7 |
| Average for full year 1927 | 119.2 |
| Average for full year 1926 | 117.0 |

The volume of production in American industry taken as a whole during 1927 was also 2 per cent above that reported for 1926. As with the electrical manufacturing industry, the gains made in productive operations by general industry during 1927 were confined very largely to the first half of the year. General industry closed the year on a plane about 8 per cent over December, 1926, due mainly to improved conditions in the steel and automobile industries, although other industrial groups, such as chemicals and allied products, food and kindred products, lumber and its products, and paper and pulp, also reported operations at the close of 1927 on a scale above those witnessed at the close of 1926.



## *Delinquent Electrical Accounts*

(Data Supplied by National Electrical Credit Association)

NUMBER OF ACCOUNTS REPORTED

| Division | November 1926 | November 1927 | Per Cent Increase or Decrease | Eleven Months 1926 | Eleven Months 1927 | Per Cent Increase or Decrease |
|---|---|---|---|---|---|---|
| New York | 244 | 219 | —10.2 | 3,847 | 3,345 | —13 |
| New England | 150 | 164 | + 9.33 | 1,353 | 1,716 | +26.8 |

|---|---|---|---|---|
| New York | $172 | $135 | $1,628 | $1,698 |
| New England | 66 | 125 | 998 | 1,306 |
| Pacific Coast | 43 | 115 | 1,520 | 1,588 |
| Central | 101 | 112 | 1,218 | 1,212 |
| Middle and Southern Atlantic States | 152 | 96 | 1,265 | 1,338 |

Note:—A sharp increase in accounts is reported by the New England division. This is owing to increased association activity in this section and not to adverse economic conditions.

# Market Conditions

BUYING is more active virtually throughout the country and manufacturers report many inquiries from industrial plants. In New England industrial equipment orders dominate the market, motor sales show a gain, and electric lighting is active. In the Eastern district there is an upward trend in inquiries, industrial motor sales are good, and electric bus equipment business looks promising. Many negotiations covering industrial plant business are under way in the Southeast. Five orders for textile motors and transformers, amounting to $25,000, were placed. Three were received from North Carolina, one from Louisiana and one from Georgia.

In the St. Louis district the tone of business is better. Industrial activity improves in the Middle West. A large utility company is now buying for maintenance requirements at the rate of $75,000 per day. On the Pacific Coast many projects are planned, including an apple refrigerating plant to cost about $250,000, a Los Angeles substation to cost about $225,000, and a plant for the Pacific Can Company to be erected in San Francisco at a cost of $500,000. A number of motors were purchased for the new Seattle cement plant of the Pacific Coast Company.

## *Metal Prices Slightly Higher —Market Quiet But Firm*

Prices of copper, lead, zinc and tin are all slightly higher than a week ago, though the market has not been active. The strength has resulted from increased disinclination by producers to sell, rather than to a good consuming demand. It is felt that buying for most metals is likely to improve within a week or two; in fact, it has been materially better this last week abroad. Excellent sales of copper in the export market during the last two or three days have been a marked influence in removing the pressure to sell on the part of the custom smelters. The copper that was available from such sources until Monday at 14 cents for Eastern deliveries is no longer obtainable, and all sales on Tuesday and Wednesday have been on the 14⅛-cent, Valley, basis. The market on Wednesday was very quiet and it was intimated by one seller that 14⅛ cents was unobtainable, but until actual business is accepted at lower figures, the market must be considered at least as fairly firm at that level. Certainly it is a firm quotation as far as the major producers are concerned, and has been all week. Whether there will be any renewed concessions on the part of the custom smelters depends on the continuance of foreign buying or the resumption of interest by domestic consumers.

NEW YORK METAL MARKET PRICES

| | Jan. 18, 1928 Cents per Pound | Jan. 25, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic | 14 | 14⅛ |
| Lead, Am. S. & R. price | 6½ | 6½ |
| Antimony | 10¾ | 10¾ |
| Nickel, ingot | 35 | 35 |
| Zinc spots | 5.95 | 6 |
| Tin, Straits | 54⅛ | 55¼ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Jan. 25, 1928, 15⅞ cents.

## *Business Trends Upward in Eastern District*

While there is an upward trend in inquiries and actual orders in the Eastern district, the situation as a whole can be termed "spotty." The primary demand centers on substation apparatus and industrial equipment. A leading manufacturer states that the call for heavy equipment is at low ebb, but that industrial motors of sizable capacity are showing better sales. A central-station company in the Middle West has placed an order for a 700-hp. motor unit for circulating-pump service, and commitments for several more of similar type are now pending from the same quarter. Another manufacturer reports a number of interesting prospects for the sale of substation apparatus in the metropolitan district and early orders are expected. Electric bus equipment business looks very promising. Steam railroads have been making inquiries for their proposed electrification requirements, and encouraging early spring sales are anticipated. A manufacturer of transformers says that there has been a marked increase in inquiries and orders during the past fortnight. A recent order from a New Jersey broadcasting station was for a 300-kw. transformer unit, with auxiliary equipment, totaling close to $18,000. A maker of porcelain insulators reports a better demand for high-tension equipment. A large order has recently been placed by a California utility for suspension insulators and other good business of this nature is looked for in the immediate future. The past two weeks show gross sales comparing well with the same period of a year ago. Electric marine equipment demand gives early promise in this district.

Immediate construction projects in the district include the following: The Pennsylvania Railroad Company, Philadelphia, Pa., is asking bids until Feb. 2, for transmission towers (Contract No. 7-1928). The Public Service Electric & Gas Company, Newark, N. J., plans an equipment, storage and distributing plant at Jersey City, estimated to cost $150,000. The Quaker City Cold Storage Company, Philadelphia, Pa., will soon ask bids on revised plans for an eleven-story cold storage and refrigerating plant to cost about $1,000,000. The Gold Hosiery Company, New York, plans a power plant at its mill at Milroy, Pa., costing complete $150,000. The Baltimore & Ohio Railroad Company, Baltimore, Md., plans a power plant in connection with engine house, shops, etc., at Youngstown, Ohio, with complete project to approximate $1,000,000. The Consolidated Gas, Electric Light & Power Company, Baltimore, proposes to purchase the Harford County properties of the Northern Maryland Power Company, including system at Havre de Grace, and will extend transmission lines in that territory. The general purchasing officer, Panama Canal, Washington, D. C., will receive bids Feb. 9, for motors, conduits, cable, wire, transformers and other electrical and mechanical equipment (Panama Schedule 1855).

### *Active Market in Southeast— Inquiries Increase*

With inventories practically over, activity is to be noted in the electrical field in the Southeast. Inquiries from industrial plants continue to increase and conditions are better than for many months past. Many negotiations are under way which will undoubtedly result in satisfactory orders within the next few weeks. Central-station companies are buying in slightly better volume, though the orders are individually small, with few exceptions. The largest central station order was from Florida for power transformers amounting to approximately $20,000. Meters and transformers continue in good demand, one company's orders for distribution and small power transformers totaling about $3,300. This same company ordered a search-lighting unit costing $2,100. Two power companies placed orders for creosoted pine poles, one order amounting to $1,100 and the other, $1,000.

One manufacturer reports the receipt of five textile motor and transformer orders aggregating $25,000, three of the orders being from North Carolina, one from Louisiana and one from Georgia. There is a new textile mill project in Georgia, on which bids will be asked in the very near future, which will call for motors and wiring materials amounting to approximately $12,000 and transformers and substation, around $5,000. There are two electrification projects in the same state, one a textile mill and the other an ice plant, on which contracts are expected to be let this week. Three textile mills placed supply orders which averaged $1,000. Municipalities are buying little, though one town ordered weather-proof wire amounting to $800.

The Georgia Power Company has purchased the municipal distribution system in Gordon, which system was formerly supplied by the Central Georgia Power Company, an affiliated company. The rehabilitation and extension of the distribution system will be undertaken. Other construction activities are: The Alabama Cotton Mills Company, Haleyville, Ala., plans a new mill to cost $200,000. Miami, Fla., plans an improved lighting system in the business district. Miami Beach, Fla., is asking bids until Feb. 1, for an ornamental lighting system. The Florida Cold Storage Company, Orlando, Fla., plans a cold storage and refrigerating plant to cost $350,000. The Southeast Georgia Power Company plans improvements in the recently acquired power plant at Alma, Ga. The Columbus Electric & Power Company plans a transmission line from Hamilton to Talbotton, Ga., about 30 miles. The Island Utilities Company, Kansas City, Mo., will purchase the power plant at New Albany, Miss. The Crane Enamelware Company, Chattanooga, Tenn., plans plant additions to cost about $500,000. The American Glantzstoff Corporation, Elizabethtown, Tenn., will build a power plant at its proposed rayon mill, to cost complete about $2,000,000. The Edisto Public Service Company has acquired the municipal power plant at Allendale, S. C. The Savannah River Electric Company, Greenwood, S. C., has received permission for a hydro-electric power development on the Savannah River, near Clark's Hill, with an ultimate output of 120,000 hp. The Appalachian Electric Power Company plans a transmission line from Sullivan to Ralco, with substation installation, estimated to cost $40,000. The Monongahela-West Penn Public Service Company will build transmission lines to Fowlerstown, Franklin and neighboring points in West Virginia.

### *Buying More Active in New England District*

Active buying and an increasing number of inquiries are reported by manufacturers in the New England district. Industrial equipment orders dominate the market, and motor sales gained during the week. A manufacturer reported an order for fractional horse-power motors amounting to over $10,000, and a number of orders for ratings up to 20 hp. are noted. Textile mills are showing an interest in the individual drive plan and several group motor orders are pending. Heavier equipment buying is quiet though the inquiries for turbo-generator units are increasing and the prospects for a number of interesting sales are very encouraging.

Central station supplies are moving slowly, and general equipment and scheduled material is moving fairly well. Industrial electric heating is active and forecasts by a number of prominent manufacturers indicate a strong trend toward the adoption of this equipment. The Connecticut Light & Power Company reports an increase of 2,515 kw. connected heating load for 1927. Electric lighting is active. Electric arc-welding apparatus is in good demand; five units, 200 amp. to 2,000 amp., were recently sold. The general tone is more optimistic throughout this district. A central-station company plans to install a new synchronous condenser in the near future. Permit for a development of 50,000 hp. at Windsor Locks, Conn., has been granted in a recent court ruling. Building contracts show a gain over last year. The Central Falls Manufacturing Company, Central Falls, R. I., plans the rebuilding of its woodworking plant recently destroyed by fire with loss of about $100,000.

### *Industrial Activity Improves in Middle West*

Conditions in the Middle West are very favorable, with industrial activity on the increase. The various utility companies are busy and maintenance purchasing is quite large, running about $75,000 per day for one large company. Apparatus purchased includes a 60-ft. revolving car dumper including steel platform, motor drive control and wiring, complete for $130,000, five vertical traveling screens for intake crib, 12 three-speed selector switches complete with appurtenances, paper and lead covered cables valued at $1,500,000, "Mazda" lamps valued at $140,000 and 300 direct-current watthour meters 5 amp. to 2,000 amp. capacity.

Construction plans are as follows: The Ames Shovel & Tool Company, Anderson, Ind., plans plant additions to cost about $100,000. The Iowa City Light & Power Company, Iowa City, Iowa, will install additional equipment in its power plant in the Coralville district. Moorehead, Minn., will make extensions in its municipal lighting plant, at a cost of $35,000. The Board of Education, Rochester, Minn., plans a central power plant for school service, to cost about $100,000. Willmar, Minn., plans additions in its municipal electric light and water plant. The Elkhorn Valley Power Company plans a transmission line in vicinity of Scribner, Neb., to cost $25,000. Carrington, N. D., plans an ornamental lighting system. Battelle Memorial Institute, Columbus, Ohio, plans a group of laboratories and shops to cost about $500,000. The Ohio Power Company is planning an equipment storage and distributing plant at Crooksville, Ohio, to cost about $45,000. The Economy Rubber Products Company, Dayton, Ohio, plans a new plant to cost $125,000.

### *Many Projects Planned on Pacific Coast*

Miscellaneous projects on the Pacific Coast include new street-lighting systems for Tulare and Madera, a $250,000 apple refrigerating plant for Watsonville, a $5,000 fire-alarm addition to the Sacramento system, a $600,000 State teachers college for Santa Barbara, $3,000 worth of line material and telephone cable for the Delta district, $2,500 worth of reflectors for a Sacramento State Building, $1,500 worth of electrical equipment for a polytechnic school at San Luis Obispo and smaller power line jobs requiring about $2,500 of material each for south San Francisco and Marysville. An outstanding power line job for the Truckee Carson irrigation project near Fallon, Nev., requires nearly $15,000 worth of material. Power company inquiries include 1 carload of pole line hardware. Large power construction, which will not materialize till the Fall, includes such projects as an approximate 40,000-kw. generating station in the Tiger Creek district and a $500,000 steam plant in the Bay Region. A central California company has projected a lighting, cooking and heating load campaign necessitating nearly a $400,000 expenditure the hiring of nearly 100 new salesmen and a $2,000,000 annual revenue rate reduction. Industrial orders include a $6,000 switchboard for an Hawaiian sugar plantation, and 2 motors, 75 hp. each, with accessories totaling $5,500 for a Sierra Lumber Company. Miscellaneous large construction announced includes a $200,000 addition to the United States naval base at Pearl Harbor, Hawaiian Islands, a $750,000 cement plant for Cajon Pass near Devore, a $1,250,000 building for a Los Angeles clothing company, and $2,000,000 to be spent by the government, $1,000,000 immediately on a complete air corps plant at March Field, Riverside. A feature of recent construction is the number of pedestrian tunnels necessitated by traffic accidents. They carry a high proportionate lighting installation.

Contracts closed in the Puget Sound district cover a number of motors for the Seattle cement plant of the Pacific Coast Company. The city of Seattle placed an order for approximately $66,000 worth of additional equipment for the Cedar Falls hydro-electric generating unit. Pump and motor business for irrigation and drainage of the eastern Washington orchard districts is maturing. A Seattle firm reports the sale of eight outfits last week. Sales of motors in Seattle to lumber mills, industrial plants, etc., aggregated more than 100 machines.

Construction projects are as follows: The California Portland Cement Company, Colton, Cal., will make plant extensions to cost about $500,000. Board of Education, Glendale, Cal., will build a power plant at its proposed new group high school. Los Angeles, Cal., plans an ornamental lighting system on Florence and Highland Avenues, and Landa Street. The Municipal Power & Light Bureau, Los Angeles, Cal., plans a substation and distributing plant on Broadway, Venice, to cost $225,000. Pasadena, Cal., plans an ornamental lighting system on Chester Avenue, using concrete standards. The Pacific Can Company, San Francisco, Cal., plans a new plant to cost about $500,000, with equipment.

Santa Ana, Cal., plans an ornamental lighting system on Bush Street. Santa Monica, Cal., plan an ornamental lighting system on Broadway. Blackfoot, Idaho, plans a municipal light and power plant. The Montana Power Company plans extensions in transmission lines at Simms and Fort Shaw, Mont., to cost about $30,000. The Utah Asphalt Corporation, care of John F. Cregon, Third Street and North Grand Avenue, Pueblo, Colo., engineer, plans a new electric-operated mining plant to cost more than $750,000, at properties near Price, Utah. The Smokeless Fuel Company, Salt Lake City, Utah, plans a new plant to cost in excess of $850,000. The Puget Sound Power & Light Company plans two substations in the vicinity of Bellingham, Wash.

### *Tone of Business Better in St. Louis District*

The general tone of business in the St. Louis district has been better. Contract for a 4,500-kw. turbo unit is reported closed. An order was placed for a 1,000-hp. motor for a government dredge boat at a cost of about $10,000, and another for a lot of 40-hp. and 75-hp. motors for a large stone company at a cost of $3,000. The movement of medium-sized motors has been steady. Several good shipments on conduit fittings and other construction materials are reported.

Construction projects in the district are as follows: The Camden Ice & Coal Company, Camden, Ark., will rebuild its ice plant, recently destroyed by fire, with loss reported in excess of $60,000. The Electric Ice Company, McCrory, Ark., plans an ice plant at Sheridan, Ark. The Central States Power & Light Corporation, Davenport, Iowa, has purchased power plant of the Church Point Light, Power & Ice Company, Church Point, La. The Southwest Power Company, McAlester, Okla., plans a substation at Rogers, Ark., and improvements in its system at Lowell, Ark., to cost about $35,000. The Southwestern Sales Corporation, Tulsa, Okla., plans power plant in the reservoir hills section. The Chamber of Commerce, Dallas, Tex., plans a local cotton mill to cost in excess of $650,000. The Standard Ice Company, Houston, Tex., will build an ice plant on the Harrisburg Boulevard, to cost $125,000. Vernon, Tex., is asking bids until Feb. 6, for one 360-hp. Diesel engine, direct-connected to electric alternator, with belt-driven exciter, switchboard, etc.

# Activities of the Trade

## Hygrade Lamp Company Buys Triumph Lamp Works

The Hygrade Lamp Company, Salem, Mass., announces the purchase of the plant and business of the Triumph Lamp Works, Indianapolis, Ind. F. A. Poor, treasurer of the Hygrade company, informs the ELECTRICAL WORLD that the business will be transferred to Salem, closing the Indianapolis factory and increasing the output of the Salem plant to 75,000 lamps per day, a gain of 25 per cent.

## Andrews-Bradshaw Merges with Blaw-Knox Company

The merger of the Andrews-Bradshaw Company of Pittsburgh, with the Blaw-Knox Company has just been consummated. The Andrews-Bradshaw Company is a Pennsylvania corporation whose principal product is known as the "Tracyfier"—a device for cleaning steam, gas, air and vapor. No change in the organization of the Andrews-Bradshaw Company is contemplated, with the exception that the products of that company will be manufactured in the main plant of the Blaw-Knox Company at Blawnox, Pa. The Andrews-Bradshaw Company will operate as the Andrews-Bradshaw division of the Blaw-Knox Company.

This merger gives to the Blaw-Knox Company an additional product for the power plant field, in which the company is already represented through its air preheaters, standard steel buildings, clamshell buckets, and electroforged steel grating. The company also manufactures steel forms for concrete construction, transmission towers and poles, road builders' equipment of all types, equipment for water cooling high temperature furnaces, and other products.

## Westinghouse Gets Orders for Carbon Circuit-Breakers

Two large orders for carbon circuit-breakers have been placed with the Westinghouse Electric & Manufacturing Company. The first, an order for 50 type CL carbon breakers of capacities ranging from 1,200 amp. to 10,000 amp., was sold to the American Rolling Mill Company. This order amounts to approximately $35,000. The second order, consisting of 75 hand-operated, plain automatic type CL carbon breakers, was sold to the Narragansett Electric Light Company. This order includes breakers of capacities from 1,200 amp. to 2,000 amp., and amounts to approximately $9,000.

THE TAPLET MANUFACTURING COMPANY, Philadelphia, announces the appointment of C. H. Van der Bloom, 3684 East 163d Street, Cleveland, as district representative for Taplet conduit fittings in the state of Ohio, Erie, Pa., and that part of New York State west of and including Rochester.

CURTIS LIGHTING, INC., Chicago, manufacturer of "X-Ray" reflectors, announces the appointment of Otis F. Fulhage as resident engineer in Des

Moines, Iowa. The company also announces that George R. Kelly has joined its Chicago sales force.

THE BOTFIELD REFRACTORIES COMPANY, Swanson and Clymer Streets, Philadelphia, manufacturer of "Adamant" firebrick cement, announces the appointment of Ires Prosser as Southeastern representative, with headquarters at Atlanta, Ga., to cover the entire Southeast from North Carolina to San Antonio, Tex.

THE OHIO BRASS COMPANY, Mansfield, Ohio, announces that Frank W. Gorman, formerly with the Mine & Smelter Supply Company, El Paso, Tex., has joined the organization as district sales representative and will make his headquarters in El Paso, covering the states of Arizona, the Panhandle section of Texas, New Mexico and Mexico. Mr. Gorman succeeds L. M. Keating who will assume duties in the general sales department of the company at Mansfield. The company also announces the opening of new offices at 703 Frisco Building, Ninth and Olive Streets, St. Louis. H. W. Kilkenny is district sales manager.

THE C. O. BARTLETT & SNOW COMPANY, Cleveland, announces the appointment of William W. Dodge as its sales representative in western New York with headquarters at Warsaw, New York.

THE OLIVER IRON & STEEL CORPORATION, Pittsburgh, announces that its line material department has appointed Frank P. Withers district manager with headquarters at 332 South Michigan Avenue, Chicago.

THE GENERAL ELECTRIC COMPANY announces the appointment of C. N. Gregory as manager of the New Haven, Conn., office, succeeding Frederic Cutts, and R. B. Ransom has been appointed resident agent in charge of the Hartford office, succeeding Mr. Gregory.

# New Equipment Available

## Gang-Operated Indoor Disconnecting Switches

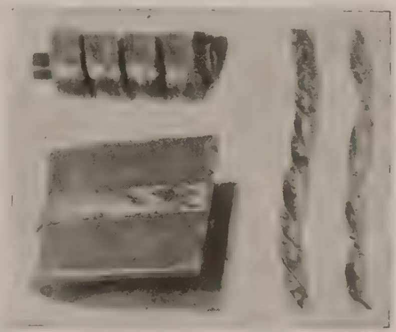
A new line of simplified gang operated indoor disconnecting switches has been developed by the Delta-Star Electric Company, Chicago. All units of the switches are mounted on a single steel base, thus permitting installation on pipe or angle iron frame. The interconnecting mechanism is placed on the back of this base, which permits a simplified mechanism. Appearance of the switch from the front is the same as any ordinary group of single-pole switches and secures the advantage of gang operation without additional space. These switches can be furnished for various ampere capacities, single-throw, double-throw or double-blade, double-throw. This new line of gang switches can also be arranged for either front, back or combination front and back connection. The voltage ratings are 7,500 volt and 15,000 volt.

## Air Preheater

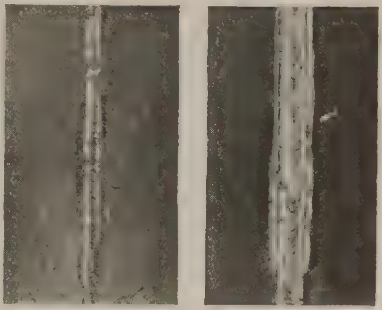
A new design of plate-type air preheater, placed on the market by the Combustion Engineering Corporation, 200 Madison Avenue, New York City, uses a welded assembly construction and is provided with clean-out doors. Access doors are provided in the heater casing to permit blowing the entire surface of the gas passages with steam or air lances. To eliminate any leakage from the air side to the gas side of the preheater, the elements are welded to the casing by means of a sealing strip, which also holds the elements in place and permits expansion of the elements relative to the casing. This construction is also said by the company to reduce greatly the amount of erection work necessary, as there are no bolted joints to be lined up. The air flow through the heater follows the "S"-flow design resulting in an effective transfer of heat from gas to air. In this design, the air inlet and air outlet are located on opposite sides of the heater, and the baffles are so arranged that all lanes of air travel are of approximately uniform length to assure an even distribution of air in all parts of the heater.

## Welding Method Gives Ductile and Low Cost Weld

The "electronic tornado" method of welding which was discovered in the research laboratories of the Lincoln Electric Company, Cleveland, about twelve months ago has been further developed to the point of commercial application. The company states that not only are the welds produced by this new process far more uniform in structure and ductility but the cost of welding is lower than that of other methods. It is stated that the cost of welding ½-in. plates, including operator's time, electric current and carbon electrode will not exceed 3 cents per running foot of weld. The cost of welding plate of other thicknesses will be proportionate. While it is not thought at the present time that the "electronic tornado" method will affect the manual arc welding process equipment which can be welded automatically will use the new principle. Welds can be applied equally well to thick or thin plates.



DUCTILE WELDS MADE BY THE NEW PROCESS. WELDS WERE TWISTED THROUGH 1,080 DEG. WITH NO SIGN OF FAILING



METALLIC ARC WELD AT LEFT COMPARED WITH WELD MADE BY THE ELECTRONIC TORNADO METHOD

Metal deposited by electric arc welding has the characteristics of cast steel. By this new process the metal deposited in the weld has equal or even better physical characteristics than the metal of the plates joined by welding. This is a result of the purifying effect of the electronic tornado. An incidental advantage of electronic tornado welding is the smooth finish which is obtained on the welding bead. This in part is caused by the higher speed of travel of the welding heads and is in part inherent in the new process.

## Portable Winch

A new portable winch, designed especially for public utility work, has been placed on the market by the Yale & Towne Manufacturing Company, Stamford, Conn. Remote control of loads is obtained and upper and lower limit stops are incorporated. A special feature of the equipment is the fact that, by fitting a lower hook and sheave wheel and anchoring the load chain to the crane boom, the lifting capacity is doubled and the hoisting speed is reduced by one-half. A hand chain-wheel is fitted to the hoist sprocket so that the motor can still be operated by hand after the motor brake has been released by one of the manual control handles.

DROP FORGED INSULATOR CAPS.—A new line of drop forged insulator caps has been placed on the market by the American Forge & Machine Company, Canton, Ohio. These caps, which are of the ball and socket type, have been tested up to 36,000 lb. and a routine test of 30,000 lb. is made without the caps showing any distortion. The caps are hot-dip galvanized.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Jan. 3, 1928)

1,654,563. Electrical Welding Machine; A. C. Taylor, Warren, Ohio. App. filed Jan. 16, 1925.

1,654,576. Wave Deviation Meter; L. W. Chubb, Edgewood, Pa. App. filed June 6, 1924. For the determination of the deviation of alternating-current equipment from the theoretical or true sine-wave characteristics.

1,654,599. Fitting Table Heater; E. J. Ovington, Auburndale, Mass. App. filed Feb. 5, 1926. For fitting a spectacle frame.

1,654,613. Electric Switch; I. E. Smith, Stockton, Calif. App. filed March 8, 1926. Motor-starting magnetic switch.

1,654,643. Mail Box Switch; J. P. Gennoy, Oakland, Calif. App. filed Dec. 9, 1922. With signal device.

1,654,646. Electromagnetic Contactor; W. G. Hartwig, Chicago, Ill. App. filed Jan. 22, 1923. For use in connection with heating or cooling apparatus.

1,654,650. Safety Appliance; F. Hymans, Yonkers, N. Y. App. filed April 15, 1926. For elevators.

1,654,657. Cable Terminal; E. M. Matthews, Jamaica, N. Y. App. filed April 16, 1924. Adapted to distribute conductors fanned out from electric cables.

1,654,660. Connecter; J. A. McKay, Toronto, Ontario, Canada. App. filed June 20, 1924. For joining relatively small wires such as are used in lighting fixtures.

1,654.705. Storage Battery; C. E. Schlossnagel, Swissvale, Pa. App. filed Jan. 29, 1927. Vent plug.

1,654,730. Maximum-Demand Meter; F. C. Holtz, Springfield, Ill. App. filed Dec. 10, 1923.

1,654,768. Electrotherapeutic Machine; J. B. Wants, Oak Park, Ill., and A. A. Grothe, Chicago, Ill. App. filed March 13, 1925.

1,654,774. Rotor Shaft and Bearing Support for Electric Motors; A. Arutunoff, Jackson, Mich. App. filed June 14, 1924. For motors or other structures requiring a long shaft with a long rotor.

1,654,776. Short-Circuiting Device; E. C. Ballman, St. Louis, Mo. App. filed Sept. 4, 1925. For single-phase motors.

1,654,778. Preformed Positive Electrode and Process of Making the Same; R. C. Benner, Bayside, N. Y., and J. H. Fink, Brooklyn, N. Y. App. filed July 10, 1923.

1,654,779. Process of Making Preformed Negative Electrodes; R. C. Benner, Bayside, N. Y.; A. J. Briggs, Syracuse, N. Y., and J. H. Fink, Brooklyn, N. Y. App. filed July 10, 1923.

1,654,813. Electric Switch; C. H. Jockmus, Ansonia, Conn. App. filed Oct. 11, 1923. Pull-chain switch for electric lamp socket.

1,654,823. Flashlight Battery; W. R. Millar, Palmerston, Ontario, Canada. App. filed Jan. 21, 1927.

1,654,838. Branch Terminal for Overhead Lines; W. Schroeder and J. Nolte, Bruckhausen, Germany. App. filed June 15, 1925.

1,654,840. Induction Motor; P. F. Shivers, Wabash, Ind. App. filed April 9, 1925. Field-magnet core.

1,654,842. Electric Heating Device; L. A. Smith and R. Rzeminiecki, Washington, D. C. App. filed May 14, 1927.

1,654,860. Electric Heater; J. H. Carmean, Kansas City, Mo. App. filed Feb. 5, 1926. Portable heater.

1,654,910. Process for Treating Articles in Metallic Baths; N. J. Barbier, St. Etienne-Loire, France. App. filed Oct. 28, 1925.

1,654,928. Control and Indicating System for Electric Railways; J. C. Field, Orange, N. J., and F. Zogbaum, New York, N. Y. App. filed Sept. 28, 1923.

1,654,931. Theft-Alarm Device; M. Greene, New York, N. Y. App. filed June 4, 1926.

1,654,937. Regulator of Electric Distribution Systems; H. de B. Knight, Rugby, England. App. filed July 27, 1926. Particularly from direct-current supply means, such as rotary converters, generators, rectifiers or the like, which are operating in parallel with vapor electric discharge devices, such as mercury-arc rectifiers or tungar rectifiers, in which the voltage of the direct-current output can be controlled by control electrodes.

1,654,948. Regulator; L. W. Thompson, Schenectady, N. Y. App. filed Oct. 24, 1925. For regulating the voltage.

1,654,956. Control Apparatus; E. W. Allen, Schenectady, N. Y. App. filed April 30, 1925. Reactance control apparatus.

1,654,971. General Alarm System for Battleships; P. S. Grierson, South Orange, N. J. App. filed Sept. 21, 1921.

1,654,979. Regulation of Electric Distribution Systems; H. de B. Knight, Rugby, England. App. filed Oct. 4, 1926.

1,654,983. Circuit Interrupter; W. O. Lum, New York, N. Y. App. filed Dec. 2, 1924.

1,654,986. Reversing Switch; W. R McCathran, Washington, D. C. App. filed Nov. 24, 1922.

1,654,987, 1,654,988, 1,654,989. Regulator; A. H. Mittag, Schenectady, N. Y. Apps. filed Oct. 28, 1925, and March 10, 1927. For regulating the voltage.

1,655,009. Speed-Governing Mechanism; W. A. Browne, Washington, D. C. App. filed Dec. 29, 1922.

1,655,026. Electrolytic Cell; H. O. Siegmund, West Orange, N. J., and B. E. Brown, Mountain Lakes, N. J. App. filed Sept. 16, 1924.

1,655,034. Adjustable Reaction Resistance; F. J. Zamboni, Hynes, Calif. App. filed Jan. 24, 1925.

1,655,193. Heater Attachment for Electric Fans; M. Murphy, Rushville, Ind. App. filed Aug. 9, 1926.

1,655,220. Three-Position Relay; T. E. Clark, Detroit, Mich. App. filed May 2, 1925. For train control.

1,655,231. Vehicle Driving Apparatus and System; A. V. Livingston, New Haven, Conn. App. filed July 11, 1925.

1,655,237. Protective Relay for Series Releases; W. H. Petersen, Ludvika, Sweden. App. filed Dec. 11, 1925.

1,655,244. Telemetric Summation System; R. M. Rowell, Lynn, Mass. App. filed May 7, 1925.

1,655,252. Frequency Changer; R. A. Warner, Schenectady, N. Y. App. filed Dec. 10, 1926.

1,655,258. High-Tension Cable Joint; W. E. Boyle, New York, N. Y. App. filed March 22, 1923.

1,655,277. Electrical Heating System; G. N. Madsen, Minneapolis, Minn. App. filed Jan. 25, 1926.

1,655,279. Mount-Making Machine; M. E. McGowan, Newark, N. J. App. filed Nov. 25, 1921. Incandescent-lamp mounts.

1,655,286. Electric Motor; H. E. Nietsche, Detroit, Mich. App. filed April 13, 1925. Of the portable type adapted to be utilized with small storage batteries of low voltage.

1,655,307. Protective Arrangement for Alternating-Current Electric Circuits; R. W. Biles, Balcombe, England. App. filed Jan. 21, 1927.

1,655,324. Electric Furnace; P. L. J. Miguet, St.-Julien-de-Maurienne, France. App. filed Sept. 29, 1926.

1,655,334. Electromagnetic Protective Device; W. H. Peterson, Ludvika, Sweden. App. filed Dec. 11, 1925.

1,655,384. Regulating Device; C. A. Bonerz, New York, N. Y. App. filed April 7, 1923. Applicable to thermo-responsive regulators.

1,655,388. Composition and Process of Manufacture; F. J. Groten, Jr., Meriden, Conn. App. filed Nov. 23, 1922. For molded products.

1,655,389. Regulator; A. W. Hull, Schenectady, N. Y. App. filed Jan. 7, 1926.

# New Trade Literature

APPLIANCES.—The Fitzgerald Manufacturing Company, Torrington, Conn., is distributing pamphlets describing the new "Star-Rite" violet-ray machine and the electric mixer.

INSTRUMENTS.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-903, describing and illustrating types G-9 and GS-9 demand meters. The company is also distributing bulletin GEA-896, describing its oscilloscopes.

CIRCUIT BREAKERS.—Bulletin No. 580 issued by the Roller-Smith Company, 233 Broadway, New York City, covers its types ESF, ES and EI inclosed circuit breakers.

COMBUSTION EQUIPMENT AND BURNER.—The Riley Stoker Corporation, Worcester, Mass., is distributing a catalog which gives information on combustion equipment for the office building, apartment house, hotel and school. The company has also issued a leaflet describing its new flare-type pulverized-coal burner.

ARC WELDER. — Bulletin GEA-875A issued by the General Electric Company, Schenectady, N. Y., describes its belt, motor or gas-engine driven, stationary or portable, self-excited, constant-energy, single-operator type WD-300A arc welder.

AUTOMATIC MINING SUBSTATIONS. —The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has published circular No. 1785, describing automatic mining substations. It contains a general description of the apparatus, operation, etc., and also a wiring and schematic diagram for an automatic mining synchronous converter.

CONDUIT FITTINGS.—The Appleton Electric Company, 1701 Wellington Avenue, Chicago, is distributing bulletin 9-A, in which is listed a complete line of Appleton no-thread "unilets" and covers. Dimension diagrams for various types of no-thread unilet bodies are included.

SPEED REDUCERS. — The Albaugh-Dover Manufacturing Company, 2100 Marshall Boulevard, Chicago, has issued bulletin "A," covering the A.D. speed reducers. Illustrations and dimensions of the various types are included.

AUTOMATIC TIME SWITCHES.—Bulletin GEA-913 issued by the General Electric Company, Schenectady, N. Y., describes and illustrates its types T-8 and T-9 motor-operated automatic switches, for use only on alternating-current circuits with regulated frequency.

CRANES. — The Whiting Corporation, Harvey, Ill., has issued catalog No. 209, superseding No. 200, covering its complete line of cranes. This catalog contains many illustrations of crane installations.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Sydney, Australia (No. 29,226), for electrical appliances.

An agency is desired in Bogota, Colombia (No. 29,118), for flashlights and lanterns.

An agency is desired in São Paulo, Brazil (No. 29,173), for household electrical appliances.

Purchase or agency is desired in Manchester, England (No. 29,172), for household electrical appliances, especially vacuum cleaners.

An agency is desired in Lwow, Poland (No. 29,175), for electric motors.

Purchase or agency is desired in Leipzig, Germany (No. 29,144), for electric refrigeration machinery.

Purchase is desired in Rome, Italy (No. 29,168), of automatic traffic signals.

Purchase is desired in Copenhagen, Denmark (No. 29,174), of electric portable tools.

J. C. Cladder, Jr., 566 Amstelveenscheweg, Amsterdam, Netherlands, desires an agency for electric dishwashers, potato peelers, ice cream freezers and any other electric kitchen machinery for hotel, hospital and steamship use.

Four German firms are interested in purchasing and eventually acting as agents for American vacuum cleaners and floor polishers adapted to alternating current, 50 cycles, according to word received from Consul F. van den Arend, Leipzig. Berndt, Lax & Company, Thomasgasse, Leipzig, is interested in catalogs and quotations for an initial shipment of twenty cleaners and five polishers; Hess and Klanck, Einertstrasse 3, Leipzig, is interested in catalogs and quotations on an initial shipment of fifteen cleaners and five polishers; Iskar Apitzsch, Haus & Kuchengerate, Leipzigerstrasse 2, Delitzsch, is interested in catalogs and quotations for a trial shipment of ten vacuum cleaners, also agency terms. Wolf Seelenfreund, Magdeburg, Germany, is interested in catalogs and quotations on an initial shipment of 25 vacuum cleaners.

VOLUME 91 *New York, Saturday, February 4, 1928* NUMBER 5

## *Electrification Power Supply*

UTILITIES are confronted with the problem of supplying railroads with electricity. The railroads are confronted with the problem of electrification and purchased electrical energy. There is a mutual interest and responsibility which calls for co-operative work. Whether electrification involves direct current or alternating current is not of great importance to utilities which furnish the energy except as each system reflects itself in equipment to change energy on the 60-cycle systems in use by the utilities. This energy can be changed to direct current by rotary converters, motor-generator sets or mercury-arc rectifiers. It can be supplied as 25-cycle energy by use of frequency converters of several types. But for a given electrification project it is important that the utility and railroad engineers get together so that a broad perspective and analysis will give a decision as to type of electrification and method of energy supply which will best meet all factors. Naturally, the best transportation for the least money is desired.

Just now there is occurring a try-out period in the supply of railroads. In the direct-current field several types of equipment are in use to convert utility energy to railroad energy. In the alternating-current field several frequency-changer types are in use and several methods are proposed for handling a single-phase load on a three-phase system. In addition, for any system there are several methods for limiting demands, for isolating trouble and for handling emergencies. It is important that the data and experiences obtained from these installations be weighed and studied. A big electrification program is under way and mistakes should be avoided.

* * * *

## *Two Codes or One?*

A UNIFORM electrical code for the industry is a desirable goal and conforms to good principles of standardization. Such a program has been started recently and is based on the consolidation of the National Electrical Code and the Electrical Safety Code. But many factors must be weighed before the object can be attained or even be considered desirable for the immediate future. The National Electrical Code has been formulated on an experience basis and has a standing because it is used. It incorporates fundamental construction and installation standards. The Electrical Safety Code is new; it is little used in practice and is primarily devised to fix safety standards. Its provisions are apt to be changed when they come to be applied in the field, although the present edition of the code is very complete and has been prepared carefully. However, it represents the opinion of a committee and not the results of field trials over a period of years.

Under the conditions facing the electrical industry it is good policy to go slow on a program for consolidating the two codes. It might be better to restrict the Electrical Safety Code to safety conditions only and eliminate the duplications that now exist in the two manuals. Safety legislation is new and should be tried out in the field. When the safety code has attained an experience standing equal to that of the National Electrical Code it would be good policy to consolidate the two. At present the industry should consider the one-code proposal very carefully.

## *Bring Forth the Proof; Assure the Public*

THE proposed investigation of the electric light and power industry by Congress is becoming less and less a topic of major interest either in Washington or throughout the industry itself. Hearings before the Senate committee on interstate commerce ended last week with indications that serious questioning had arisen in the minds of many committee members concerning the desirability of any inquiry at all, so weak a presentation did the proponents for an investigation make. However, it is evident that some investigation will be recommended—not so broad in scope as that asked for by Senator Walsh, perhaps, but thorough enough to establish fundamental facts. Indeed, since Senator Johnson of California has moved for a somewhat similar investigation of the telephone industry, it would not be surprising if the entire job were turned over to the Federal Trade Commission. That body is primarily a fact-finding commission and could, by concurrent resolution of both houses of Congress, delve deeply into all the charges, including that of lobbying, made against the public utility companies.

It is significant that Senator Walsh did not question the sufficiency of electric service or the reasonableness of the rates charged therefor. His complaint ranged almost entirely around the financial operations of holding companies. There could be detected also a lurking suspicion on the part of some of the members of the Senate committee that holding-company securities represent a great deal of "water," and, although an effort was made to show this not to be the case, it may require an exhaustive investigation to convince not only Congress but also part of the public. The utility companies made no elaborate defense. In the nature of the case perhaps none was called for. The burden of proof rested on the accusers, and the record, as we have already said, shows how weak a case they presented. None the less, the whole public must be assured that not only are the accusations made against the industry groundless, but that these consolidations and combinations of electric public utility properties are really in the public interest. The proofs abound; they must be spread broadcast throughout the land.

## *The Significance of the Grounding Problem*

PROPER protective grounding is an active theme in the industry right now. The importance of the subject itself is heightened by the fact that the code-making machinery is under close scrutiny. The committee on Article 9 of the National Electrical Code, which has jurisdiction, has devoted much time to evolving new rules. A completely revised text has been prepared in lieu of the provisions of the 1925 code and will go before the N.F.P.A. electrical committee in February. As a supplement to the report of the committee on Article 9 there is being presented a minority report on the grounding of fixed appliances. In addition the National Electrical Manufacturers' Association has studied this subject and has issued certain definite recommended practices. As the situation now stands there are many viewpoints and the whole issue is beclouded.

Every branch of the electrical industry is concerned with grounding. Electrical men should, therefore, realize the fundamental importance of approaching this problem seriously and with caution, since the entire code-making system is involved. The success of the industry in working out this problem will stand as an indication of its ability to regulate itself. The fault lies not with any group, but probably in part with all, and the differences of opinion are not so widely apart that they cannot be reconciled in a practical compromise that will give adequate protection.

* * * *

## *Wired Radio Versus Space Radio —Some Commercial Aspects*

AN INTERESTING problem will be presented to the executives of the power industry before very long by the conflicting commercial possibilities that will lie in the field of radio. The issue will arise over the question of which will be the more profitable for the central-station company both in dollars and in public and trade relations—to provide a service of entertainment by carrier current distributed over its domestic circuits or to push the sale of alternating-current radio sets as energy-consuming appliances to build up residence load?

There seems to be no doubt from an engineering standpoint that so-called "wired radio" will offer opportunity for the establishment of a service of entertainment delivered on power lines through special loud speakers rented by the power company. The programs may be provided by the local company; they may be delivered by wire from some distant studio, or by contract with a broadcaster they might be taken from the air and poured onto the wires. The ability of the company to sell such a service must depend upon the quality of the programs offered and the practical superiority of the service. Strenuous objections by the local radio trade to the entry of a public utility into competition with its own customers in this field will of course be encountered.

On the other hand will lie the load-building possibilities of space radio. Already it is estimated that 550,000 alternating-current radio sets are in use and 2,000,000 using other forms of current supply, all connected to central-station circuits. An alternating-current set produces about $10 a year in revenue to the power company. The alternating-current set today is sweeping the country. Supply is away behind demand, and from now on almost every radio set that goes into a wired home is going to mean load, an increase in residence consumption of about one-third of the present national average. Moreover, the existing leadership of space-radio broadcasting will not be lightly relinquished, and it is reasonable to expect that in face of this the public will naturally be slow to abandon space-radio reception. Certainly the power companies should do anything possible to build up load with alternating-current radio.

The point is this—that the relative appeal of wired radio versus space radio will in the end boil down to a simple equation. Which will be more in the public interest? Which will offer the greater profit to the utility, the net returns from an entertainment service or the revenue from alternating-current sets in general use? In the end the issue will be determined very largely on these two considerations.

* * * *

## *Interconnection Brings Non-Standard Transformers*

INTERCONNECTION of utility systems does not make for transformer standardization during the development stage. Two-winding and three-winding transformers with tap changers on each winding and non-standard voltage ratios have been demanded of manufacturers by utility engineers. The cheapest and easiest way to make two systems operate under interconnection is to have the transformers afford the regulatory control and furnish the flexibility for reconciling differences in system voltages. Such complications as exist for these reasons can be understood and are warranted in a development stage of interconnection.

But thought should be taken to get a maximum possible degree of transformer standardization. Special features may be desirable in an individual transformer installation but may not be necessary. Nor is it reasonable to have oil, air and water cooling and combinations of these cooling methods which complicate mechanical details of transformer design so as to produce a multiplicity of special transformers. Work on transformer voltage standardization might well be supplemented by action toward building systems to interconnect with standard transformers and also by action to get a greater degree of standardization in transformer cooling methods and mechanical dimensions.

* * * *

## *Neon Lamps for Home Lighting*

THE neon-tube sign lamp is now to be seen in nearly every city as a recent development in illumination. These colored-light signs have been adopted very rapidly as a new display element in the advertising business, and they have established their place. Speculation as to the future of the neon lamp invariably leads to a consideration of its possibilities for home lighting. The absence of glare from a concentrated light source and of the necessity for shielding resistance filaments, with consequent lessened efficiency in illumination, are clearly advantages. In addition there are possibilities of color and warmth in neon bulbs that offer attractive decorative opportunities. It may be necessary to use small permalloy transformers in the base of the neon bulbs to get the voltage required for the ionization. This type of bulb could be used in existing sockets and with present lighting services.

On the other hand, several disadvantages are apparent which must be overcome before much headway can be made with neon lighting in the home. The low power factor and small energy consumption of neon lamps might well be considered with apprehension by utility companies. But past history shows that new developments never injure business. The neon lamp may force a rapid development of heavy-consumption household-appliance sales to offset the loss of revenue from resistance filament lighting and may add new possibilities for electric lighting in the homes. The future field of the neon lamp not only provides an interesting subject for speculation but is worthy of attention from a practical point of view, and this development will be watched carefully by all electrical men. Researches now under way may be very fruitful.

* * * *

## *Turbine-Blade Failures Too Frequent*

THE modern turbo-generator is a splendid achievement and represents the consummation of years of development. But it will not be finished until it shall have a maximum degree of reliability. At present the chief trouble with turbines occurs from blade failures. Rows of blades fail and cause the units to be put out of service.

No basic reason has been found for blade failures, and no general rule covers the location of the failures. It is the intermediate stage blading on the spindle which gives the trouble, so that size of blade or high-pressure effects have little bearing. It may be a vibration effect, but a more reasonable explanation is that it is caused by a combination of vibration, expansion and contraction and change in blade structure. Alloy blades have splendid characteristics on test, but any alloy must undergo life tests before it can be said to have proved itself. Some of the alloy blades may change their structure when placed in turbines or may undergo a fatigue which makes their life limited. Research work on steel alloys is needed to eliminate any chance of these effects causing turbine failures. In some cases also improper plant operation, and not inherent blade defects, may cause blade failures. It would be well to make careful studies of all blade failures, including micrographs of the metal, so that complete data may be had to improve turbine operation.

* * * *

## *Where Light Means Life*

NOWHERE is the work of the illuminating engineer more important than in the hospital operating room. Recent improvements in the lighting of these places by the use of prismatic refractors backed by high-powered lamps point the way toward new standards of practice in this vital field of service. Tests reported by H. Logan to the Lighting Engineers' Club of New England at a recent meeting in Worcester show that approximately six minutes is being saved in operations formerly averaging about twenty minutes by the provision of the above type of illumination, with its resulting excellence of distribution uniformity, high intensities at the edges and interiors of wounds and reduction of eye adjustment strain on the part of the surgeon when looking away from the operating table for instruments or supplies or for other reasons. What this means in the reduction of the period of anæsthesia and surgical shock need not be elaborated here, but the progress recorded suggests unrealized possibilities in many fields where analysis of work cycles coupled with a willingness to spend money for desirable increased intensities of illumination properly directed and distributed offers attractive rewards.

* * * *

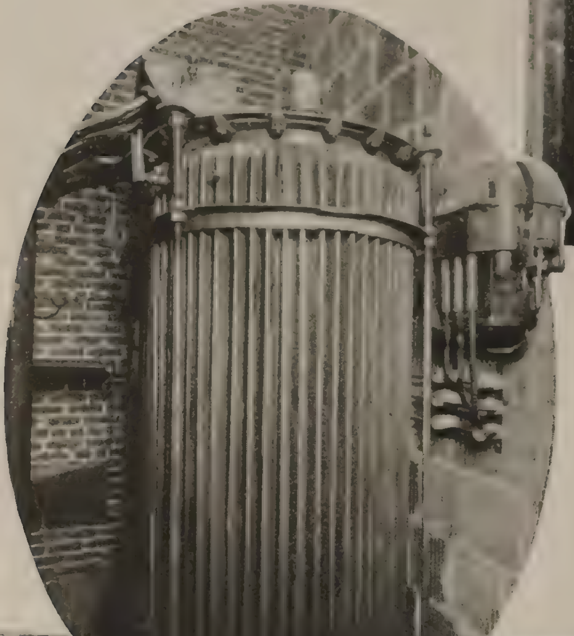
## *Obligations Inherent in the Social Contract*

ROUSSEAU did not have the central-station industry in even the innermost recess of his mind when he entitled the book that was the "Uncle Tom's Cabin" of the French Revolution "The Social Contract." He was thinking of a supposed contract between the individual and the state and of the mutual obligations of the two under that contract. Rousseau has been dead for a century and a half. His ideas, perhaps different in their fruition from his conception of them, had wide influence in their day. But the social contract has enlarged its scope. If it is still a binding agreement between the individual and the state, it is more than that. It is the unstated, and often unrecognized, obligation that the units of industry, whether personal or corporate, owe to the social organization of which they are a part. It does not necessarily follow that this obligation is of the kind to be discharged to the state in the forms of taxes and loyalty; it may be worked out in commercial relations with other members of organized society.

The agency that will bring the benefits of electric service fully into the American home, that will make farm life as comfortable and convenient as city life, is the electricity supply system. The development of electric utilities to the present day has been a history of the unequal sharing of burdens of costs. There will always be some among the total number of customers of any electric utility who, in strict equity, get a little more than they pay for and some who pay for a little more than they get. It is in the very nature of the business that this should be true. On any system it costs less to serve a residence customer within a block of the power house than one ten miles away. Yet both pay the same rate. One is paying part of the cost which, strictly, is chargeable to the other. If the customer near the power house ever took time to think about the matter, no doubt he would cheerfully accept the situation as a part of his social duty to the man who lives farther away. It takes all the residence customers, all the commercial customers, all the industrial customers, all the individual members of these groups, in any given area of city or country to permit the electricity system or systems serving them to reach the highest point of economic efficiency.

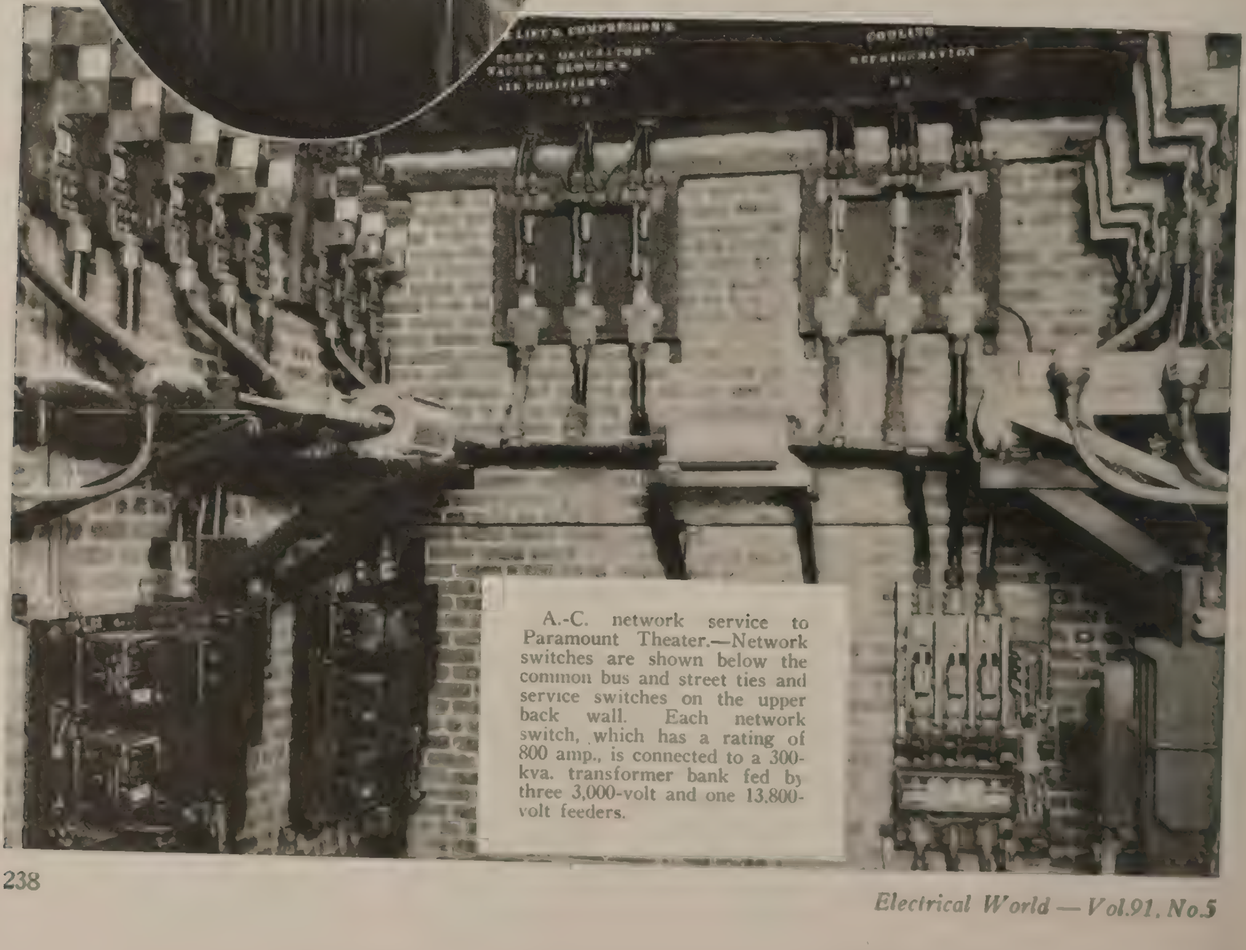
Now, in order to extend electric lines to six million more farms in the United States, to strengthen distribution systems for increased service to domestic users, to do a hundred things that will result in the full and complete electrification of our country, the electric utilities must have the co-operation of every element in the social organism. That co-operation must manifest itself in the use of electricity supplied from the systems. It is the duty of every element of society to promote agencies that are working for the progress of society. If any element or individual fails in that duty, it or he is failing in the obligations of the modern social contract which, except for the enlargement of its scope, might be construed as pretty much the same as when it was explained by Jean Jacques Rousseau.

# A.-C. Network and 120/208-Volt Service in New York City



ECONOMIC justification of alternating-current service has not deterred utilities in seeking means to make it just as reliable as the Edison direct-current network system. With this purpose in view, the network idea is being adopted at many places throughout the United States and the United Electric Light & Power Company is one of the pioneers.

Above and in oval—Bank of three 100-kva., single-phase transformers and one 300-kva., three-phase unit connected delta on high side to 13,800- and 3,000-volt feeders respectively to supply 120/208-volt, three-wire service.



A.-C. network service to Paramount Theater.—Network switches are shown below the common bus and street ties and service switches on the upper back wall. Each network switch, which has a rating of 800 amp., is connected to a 300-kva. transformer bank fed by three 3,000-volt and one 13,800-volt feeders.

# Power in National Defense

Mobilization of power resources planned. Co-operation of utilities needed. Field surveys under way. Basic plans outlined for war service

By MAJOR EDWARD C. KELTON
*Corps of Engineers U. S. Army*

ON NOV. 10, 1927, Col. Hanford MacNider, the Assistant Secretary of War, addressed the Kiwanis Club at Chicago as follows:

"Along 500 miles of broken fields and shattered villages, from the North Sea to the boundary lines of Switzerland, the deep, sullen roar fell away. Five million earth-colored creatures rose uncertainly and tried to stand up again like men. There was a new and strange throb in the breast of every one of them. This was the Armistice. It was over.

"Across the ruined countryside, where a moment before there had been no sign of life, now stood upright once more what was left of the flower of half of the great nations of the earth. The fleeting exultation of victory, of a job well done, the black pangs of defeat, the thought of a bannerless return to the fatherland, all these came and passed. Helmets were pushed back or clattered to the ground in the strange new silence. Eyes that had seen all that hate, death, hell on earth could muster met across what an instant before had meant all those things and more. The long lines of men looked curiously at the sky, at the surrounding devastation, at each other. Resentment, at least as between man and man, was already dying away.

"Across that tired and unhappy and broken land came the faint cheering of men—faint as if afraid that this could not be real. Not a cry of release from peril, or hardship, or pain, but as of the lifting of a curse which had been laid upon the world. It was over.

"If there was in those men's eyes a thing that might be read, it was: 'So that was war. Well, God spare our sons and their sons. We want no more of it.' And so those men stood, swaying a bit on unsteady legs, confused at the new stillness of things, Consciously or unconsciously, a vow wrote itself across the soul of every one of them. There must be no more of war.

"Nine years ago it was, this day. Let those of us who rose from the mud of that western front, who served with the colors of our country wherever it may have been, give an account of ourselves. What have we done about it? And what do we intend to do?"

Many men such as Mr. MacNider was addressing in Chicago on Armistice Day are in the ranks, high and low, of the electrical industry; they are in the central stations, in the offices, out on the lines and in the great establishments manufacturing electrical equipment; from hard and bitter experience they understand war; they do not see anything romantic or beautiful in it; they think of it only as something to be avoided or to be terminated as promptly as is consistent with national honor. On the one hand, from their war experience they know the terrible effectiveness of modern weapons in the hands of trained men; on the other hand, from their every-day life they know the research, science, skill, time and effort that go into the production of those weapons and the enormous amounts of power that are required in their rapid manufacture. They are prone to analyze the power industry as to what it did during the World War and what position it is in at present to meet an emergency.

### POWER SHORTAGE IN LAST WAR

To some it may come as a surprise to learn that ten years ago there were serious power shortages in several parts of the country; that in the Niagara Falls district the shortages ran as high as 90,000 hp.; that the situation there was so desperate that the United States was forced to deliver coal to Canada in exchange for electrical power at a time when every train of coal crossing the International Bridge almost caused a riot among the Americans who were unable to obtain enough to heat their houses; that in certain sections it was deemed necessary for the government to take over the entire electrical output of all central stations; that just before the Armistice the situation had reached the state where the power section of the War Industries Board had introduced in Congress and was pressing for the passage of a bill calling for $200,000,000 to aid the power companies to meet the demands being put upon them by essential war industries. These conditions were not the result of any disinclination on the part of the electrical industry to aid in the war work. They were co-operating 100 per cent, but even with expansion programs rushed to completion, with interconnections hurriedly made and with every stand-by plant put in operation, no matter how inefficient it might have been, the totals available were not sufficient. Fifty and 75 per cent expansions of output over whole sections were achieved, but still the power section estimated the shortage in the seven districts it surveyed to be 236,800 hp. Finally, with certain curtailments of the less important industries, the power situation was met satisfactorily but with such a small margin of safety that only the Armistice avoided even more critical shortages in 1919.

Since the World War the electrical industry has been revolutionized and, what is more important, it has revolutionized every other industry. The table on page 241, recently published by the National Industrial Conference Board, indicates the extent of the electrification.

There seems to be no diminution in the replacement of heavy, back-breaking human effort by machines driven by electrical energy. In the two years from 1923 to 1925, according to the biennial census of manufactures, the horsepower per wage earner jumped from 3.8 to 4.3. It is now probably 4.8 hp. per wage earner. This has released many thousands of workers for other lines of endeavor. It has permitted the employment of women in places where the arduousness of the work limited their usefulness. It has, furthermore, made the individual worker more effective, so that, in spite of a reduction of 496,000 wage earners in manufacturing establishments from 1923 to 1925, the volume of production was not decreased. In fact, certain figures now indicate that the average American manufacturing wage earner can produce 49 per cent more than he could in 1889. The reason is easily discovered—the use of machinery; but, more important still, the electrification of industry.

Within the electrical industry itself the technical and organizational developments have been no less remarkable. One ton of coal now does the work of three. Economic transmission distances have been increased, safety and reliability of service and improved standardization of equipment have resulted in simplicity, increased usefulness and convenience to the consumer. Electricity has been applied to an ever-widening field of useful purposes. Reciprocal agreements between companies, and other efforts, have raised load factors to points not dreamed of in 1917.

### GOAL NOT YET REACHED

The goal is not yet reached. In spite of an increase of 17 per cent in the last three years, industry is still only 73 per cent electrified. Electric furnaces have not yet come to their rightful position; the electrification of the railroads has just begun; the Diesel electric drive for highway, rail and water transport lags behind that of several other countries, in spite of its proved efficiency; the market for electricity for house heating has not been scratched, in spite of the fact that the earnings from byproducts that now go up every stack, if turned to reducing rates for service of this type, could in a few years meet the competition of dirty, inconvenient coal- and even oil-burning service. This will be even more true when the present flush production of petroleum falls, as it must, in a few years. Research and development will continue to place electric energy in every phase of our economic life.

If all this be true, why should the War Department or the government be studying the problem of the mobilization of industries of the country? Why should it be making attempts to obtain the co-operation of the power industry in an effort to have it ready for instant mobilization in case of a war? It is because Congress and its defense agencies, the Army and Navy, as well as many leaders of industry, foresee conditions that are quite different from those that obtained at the outbreak of the World War. These may be outlined briefly.

Primarily, in the case of a major emergency, the demand upon industry will be far greater and much more intense than it was in 1917. In those dark days the War Department was practically without a military plan of mobilization and quite without an industrial mobilization plan. Five or six months passed before the decision was finally reached, calling for the mobilization of 3,000,000 men. Mobilization moved slowly. Orders for munitions were not issued promptly. Now, however, plans are available not only for the mobilization of the number of men required to meet a major emergency but also for the prompt placing of orders for the billions of dollars' worth of supplies required to put and maintain that army in the field. These orders will be placed immediately upon the outbreak of a major emergency. Industry will start to execute the tasks that have been outlined in time of peace. True, efforts will be made to limit the production of non-essential industries and to turn their efforts to war work, but the final result will be an increased industrial activity, which, of course, means increased demand for electrical power.

Second, we little realize the extent of mechanization required in another emergency. Tanks, gas containers, bombs and a few airplanes upset our calculations and strained our unorganized industry in the World War. We visualized and had planes carrying 200-lb. bombs. We had perhaps one plane for every 5,000 of our soldiers in France; who can say that it will not be one to 50 the next time, with each one of them carrying 500-, 1,000- or 4,000-lb. bombs? Rates of artillery fire will be much greater. Power is required to manufacture the planes, the bombs, the gas, the shells, as well as the trucks, the locomotives, the steel, the machine tools, the prime movers, and also to mine the coal and iron ore required in producing and transporting those products to the front. The undoubted increased mechanization of the Army is reflected back and back in increasing waves to the ultimate demand for power.

Again, the very efficiency of the power industry, in raising the load factor, is filling up the valleys in the load curves that were of such importance in meeting the war demand in 1918. Reciprocal operating agreements are cutting down or total reserve generating capacity. With every such agreement it becomes possible for one or both power companies to put off for one or two years the installation of new units or the building of new plants. Reserve stand-by plants may be scrapped. All this is good business. Load factors are rising, overhead costs are being reduced and the country as well as the industry is benefiting from the practice. Still the fact remains that the reserve available to meet an emergency is being cut and cut. Increased efficiency and co-operation promptly made thousands of horsepower available in the World War. Efficiency and co-operation under the stimulus of a national emergency are quickly mobilized, but the making of electrical equipment is not so promptly done. Certainly we should not slacken up on our struggles for efficiency and economy, but we should realize our reserves are being cut and not sink back with a false feeling of security. Under the present favorable financial conditions of the public utilities, the danger is not extreme, but a period of hard times and of intense retrenchment might promptly make the situation critical. Furthermore, the danger appears in its true light when it appears certain that in time of war the central stations, perhaps already breaking under the war demand, will find themselves unable to obtain equipment for expansions because of large direct war orders that may require preference over civilian demands for normal expansion. A little margin of capacity is quite as desirable for national safety as for local protection against interruptions in service. One prevents annoyance and delay; the other may prevent national disaster.

In a major emergency the demands of the Army and Navy for munitions will be extremely large. Theoretically the Navy is more nearly prepared for instant action than the Army. It is well recognized that the Navy cannot go to sea without ships and that it takes two or three years to build a battleship. Hence the Navy's demand upon industry for supplies and equipment will scarcely be as great as that of the Army. Therefore the Army has the paramount interest in seeing that adequate supplies of power are available for the production of its war munitions. Certain items for the Navy are of equal importance, but the total demand for power for munition purposes naturally becomes of prime interest to that agency whose success and whose very existence depend upon it.

### National Defense Act Passed

It may have been some such reasoning that caused Congress in 1920 to pass the national defense act charging the Assistant Secretary of War with the supervision of the procurement of all military supplies and other business of the War Department pertaining thereto and with the assurance of adequate mobilization of material and industrial organizations essential to war-time needs. Be that as it may, the War Department has felt its responsibility, in connection with other industrial mobilization studies, to survey and to ask the power industry to prepare itself to meet the demand that would be placed on it in time of war.

Since 1921 the Corps of Engineers of the Army has been conducting a survey of the power facilities of the country. It has obtained fairly complete information concerning all central stations of 5,000 kw. or over, such as capacity and characteristics of generating stations and transmission lines, interconnections between systems and finally data as to proposed extensions and improvements both under expected normal expansion and under maximum possible expansion in case of emergency. In all cases the co-operation of the members of the central-station industry with the War Department has been most hearty and data even of the most confidential nature have been given freely to the Corps of Engineers, with the understanding, of course, that such information was to be held strictly confidential. With these data much progress has been made in preparing to place our industrial load in such a way as to avoid overloading any particular section. The surveys have also listed the items of major equipment necessary for the expected expansion program. This has enabled the War Department to visualize one of the major manufacturing loads and will insure the essential needs of the central-station industry for equipment being cared for.

However, with the best of planning, shortages of power may occur. It occurred in the World War and may occur again. As a result the entire output of several large plants was taken over by the President of the United States. Such drastic action was necessary not only for the successful prosecution of war but for the protection of the rights of power companies in their relation with their customers. The power was needed for war purposes and by taking the entire output and then distributing the excess over the essential uses the demands of most of the users were met. It is only too easy to forget that such extreme conditions existed just ten years ago. It is only too easy to say that we shall never be in a position like that again. However, the War Department feels that it would be failing to do its duty if it did not attempt to take some steps to avoid such emergencies.

On June 8, 1927, the Secretary of War, Dwight F. Davis, presented a "Plan for the Co-ordination of the Use of Power in Time of War," at the annual convention of the National Electric Light Association at Atlantic City.

The plan had previously received the consideration of many leaders of the central-station industry. It represented their views and was acceptable to them in principle. It was the culmination of more than a year's co-operative effort at evolving some scheme that would insure the effective utilization of the power facilities of the country. Full extracts of Mr. Davis' address were given in the Electrical World of June 11, 1927. However, it might be well to restate the principles upon which the scheme is based. They are:

"1. The government should not take over any plant or power system unless necessary to insure the efficient prosecution of the war.

"2. No additional control should be exercised in regions where power is adequate for present and immediate future needs, both civil and military.

"3. When shortage of power for essential needs exists or is threatened, the government should take over the entire output of the plant or plants in the locality and apportion the power output to users in the best interests of the United States. This action should set aside all existing contracts for the supply of power with which such action conflicts.

EXTENT OF ELECTRIFICATION

| Year and Industry Group | Total Primary Horsepower | Electrical Primary Horsepower: Motors Driven by Purchased Current | Motors Driven by Generated Current | Total Electrical Power | Per Cent of Total Primary Power |
|---|---|---|---|---|---|
| 1914.......... | 22,307,189 | 3,897,248 | 4,938,722 | 8,835,970 | 39.6 |
| 1919.......... | 29,297,963 | 9,260.449 | 6,965,174 | 16,225,623 | 55.3 |
| 1923.......... | 33,056,870 | 13,332,780 | 8,819,217 | 22,151,997 | 67.0 |
| 1925.......... | 35,772,628 | 15,868,828 | 10,254,745 | 26,123,573 | 73.0 |

"4. If the preceding methods fail to obtain sufficient amounts of power, the government should undertake actual operation of such plant or plants.

"5. The existing organizations of any companies taken over should be utilized in their operation, in order to make full use of the experience, training and skill of their personnel."

Following the enumeration of these principles, Mr. Davis then outlined the essence of such a plan. Before considering it, however, it is well to remember that the steps that may be necessary in time of war are a far cry from regulation by the government in time of peace. The two are separate and distinct and are not based upon the same premises. In time of peace the economic, political and social ideas of the nation must govern. In war some of the rights and privileges must give way before the greater responsibility of the nation to repulse the onslaughts of the enemy.

### Executive Feature of Plan

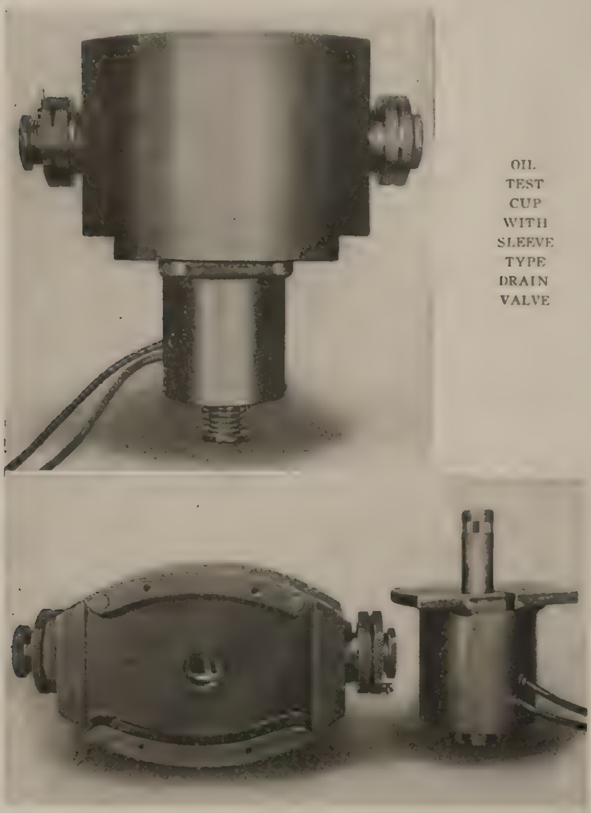
The plan calls for the selection by the President of the United States of an executive assistant, to be known as "the emergency power director," who would be responsible for the effective utilization of the power facilities of the country. The emergency power director would be assisted by an executive committee, the majority of the members of which would be nominated by the National Electric Light Association and approved by the emergency power director. These men would serve in a civilian or military capacity. The committee would serve under the direction of the emergency power director and would be the medium through which the mobilization and co-ordination of the power systems would be carried out and effective co-operation secured.

The plan was left in most general terms; it was designed to give necessary authority to the emergency power director to obtain the best results from the power industry; it had for its basic principle that the executives of the industry were the best able to bring about those results, but that they would need the added authority of the President under the law. The plan provided for this by the appointment of the emergency power director. Thus in case of war, if the situation becomes sufficiently threatening, we shall promptly have an organization, vested with legal authority, in possession of basic data as to requirements and resources of electrical power as is now being gathered by the Corps of Engineers and other agencies, ready to give every aid in co-ordination to the end that the power resources of the nation may be used to their maximum for war purposes.

# Improved Cup for Testing Oil

By J. B. Wallace
*Detroit Edison Company, Detroit, Michigan*

TO FACILITATE emptying the standard oil test cup manufactured by the Westinghouse Electric & Manufacturing Company (style No. 263621), the laboratory of the Detroit Edison Compnay once tried to support it on two horizontal metal bars on which the electrodes could be rolled, but this arrangement was found objectionable. The entire weight of the cup, 6½ lb., rested on the electrodes, with consequent danger of misalignment. When the cup was rolled over for emptying, the impurities in the bottom of the cup were thrown over the gap and tended to remain on the electrodes, unless rinsed repeatedly. A large pan beneath the oil cup was necessary to catch the oil when dumped.



OIL TEST CUP WITH SLEEVE TYPE DRAIN VALVE

To eliminate these difficulties, a valve arrangement was developed. This consists of a hollow sleeve valve in the bottom of the oil cup, which, when closed, is slightly below the bottom of the cavity. When open, the sleeve is raised sufficiently to open ports cut into its side through which the oil is discharged. The sleeve valve is normally held closed by a spring, in addition to gravity.

A solenoid coil is concentric with the sleeve and is mounted on the bottom of the cup. The sleeve is lifted by the coil when the circuit is closed, opening the valve against the spring, permitting the oil to drain out. The cup is rinsed between samples with high-test dry gasoline and dried with a hot-air hand-blower. As set up in the laboratory the cup is mounted permanently on a micarta table top set on wall brackets. A waste pipe receives the oil discharge from the lower end of the valve sleeve. The solenoid terminals are brought out to a separable connector which is opened while test potential is being applied.

With this arrangement the electrodes support no extra weight, the oil and impurities are drained down and away from the electrodes, rendering repeated rinsing unnecessary, and a permanently mounted stationary test cup is made possible. This facilitates setting the test gap exactly. The valve arrangement was conceived and designed in the testing division of the operating department and was applied to the standard cup by the electrical division of the Detroit Edison Company shops.

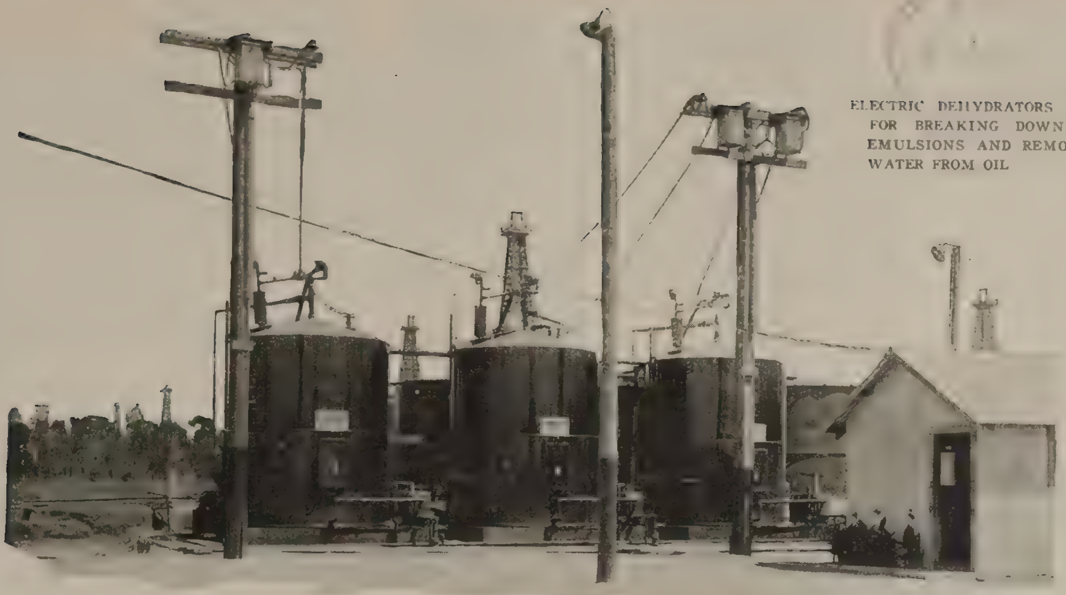
# Costs of Generating Plant Building

IN connection with the development of a New England central station a cost analysis was recently made by Jackson & Moreland, Boston, Mass., bearing upon the 1927 investment outlay required to duplicate various generating plant buildings, and from this analysis the accompanying tabulation has been prepared for use in estimating construction costs.

GENERATING PLANT 1927—BUILDING COSTS
(Excluding all overhead)

| | |
|---|---|
| BOILER PLANT | |
| Building "A," boiler house, 77 ft. x 146 ft. x 72 ft. high. | $321,656 |
| Building "B," boiler house extension, 78 ft. 6 in. x 77 ft. 6 in. x 72 ft., with monitor 42 ft. x 77 ft. 6 in. x 18 ft. high | 150,984 |
| Building "C," boiler house extensions, 78 ft. 6 in. x 87 ft. 6 in. x 73 ft. high, with monitor 42 ft. x 87 ft. 6 in. x 18 ft. high | 182,441 |
| Lighting equipment for above three buildings | 7,051 |
| Heating equipment for above three buildings, including 460 sq.ft. radiators, piping, valves, etc | 753 |
| Plumbing | 9,356 |
| Contractor's compensation | 33,612 |
| TURBINE HALLS | |
| Building "A," turbine hall structure, 61 ft. x 130 ft. x 69 ft. high | 166,539 |
| Building "B," extension 61 ft. x 46 ft. x 69 ft. high, with monitor 26 ft. x 35 ft. 6 in. x 9 ft. | 99,569 |
| Building "C," turbine hall extension, 61 ft. x 92 ft. 6 in. x 69 ft., with monitor 26 ft. x 75 ft. x 9 ft | 85,746 |
| Lighting equipment for above three building units | 3,348 |
| Plumbing equipment for drinking-water system | 279 |
| Contractor's compensation | 17,774 |
| CONTROL ROOM AND OFFICE BAY | |
| Building "A," 4 stories, 27 ft. x 125 ft. x 50 ft. high, with monitor 5 ft. 6 in. x 120 ft. x 4 ft. high | 70,330 |
| Building "B," extension, three stories, 27 ft. x 46 ft. x 38 ft. high, with skylight 5 ft. x 32 ft. x 2 ft. high, and automatic passenger elevator | 20,990 |
| Lighting equipment for above buildings | 2,647 |
| Heating equipment for above buildings | 2,654 |
| Plumbing equipment for above buildings | 5,560 |
| Contractor's compensation | 5,109 |

In general, the buildings and extensions covered embrace structures with foundations of concrete mat on wood piles, steel frame superstructure with brick exterior finish and tar and gravel roof.



ELECTRIC DEHYDRATORS USED FOR BREAKING DOWN OIL EMULSIONS AND REMOVING WATER FROM OIL

# Oil Field Power Costs

Electric pumping data given. Effectiveness of electric dehydrators shown. Electric drilling expense totals but half of that for steam

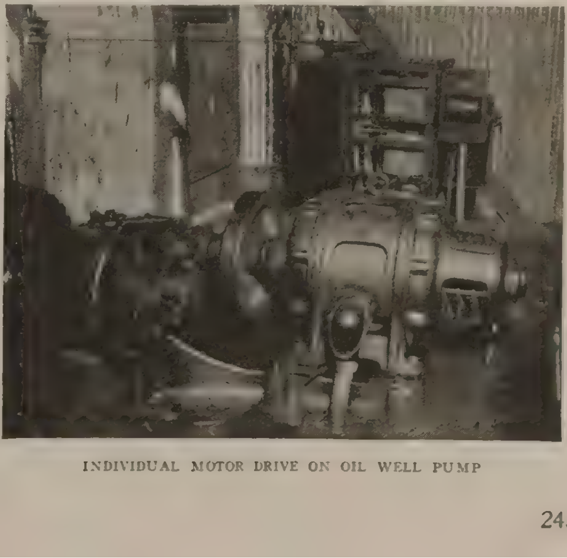
ALTHOUGH electric power was slow to invade the field of oil production, rapid progress has been made during the past few years, until now there are many fields using electric power exclusively. One such field in southern California, visited by a representative of ELECTRICAL WORLD, furnished valuable data on electric pumping and drilling costs. This was the field of the Chanslor-Canfield Midway Oil Company at Torrance, Cal., near the city of Los Angeles.

In this field there are 165 wells electrically pumped by individual motors. Records for the month of June 1927 give the following information relative to pumping:

| | |
|---|---|
| Total barrels pumped | 271,796 |
| Total kilowatt-hours consumed for pumping | 907,486 |
| Average kilowatt-hours per barrel pumped | 3.34 |
| Average cost per barrel for power, cents | 2.7 |
| Average rate per kilowatt-hour, cents | 0.81 |
| Average pumping depth for all wells, ft. | 2,890 |
| Maximum power demand for all purposes, kw. | 1,723 |

Since all pumping in this field is done electrically, no comparative gas or steam pumping costs are available. However, from checks made in another field operated by the same company it has been found that in making a new installation, electric pumping with power at 1 cent per kilowatt-hour is considerably more economical than gas engine pumping using 900 B.t.u. gas that could otherwise be sold at 10 cents per 1,000 cu.ft. One point strongly in favor of electric pumping is that about one-third less labor is required to take care of the pumps. If the 165 wells in the Torrance field were pumped with gas engines, nine men per shift would be needed to attend to the pumps instead of three men now used for the electrically driven pumps.

Two general systems of electric pumping are used in the oil fields; one is the individual motor drive, as in the Torrance field, the other is the so-called jack system, whereby the walking beam of the well pump is actuated by a cable attached to an eccentric motor-driven ring, centrally located with respect to six to eight wells. The latter system has the advantage of lower first cost and lower pumping cost as well, but necessitates the use of portable well bailing and cleaning rigs, which partly



INDIVIDUAL MOTOR DRIVE ON OIL WELL PUMP

SIX 1,000-KVA. TRANSFORMERS FED FROM TWO 15,000-VOLT LINES SERVING SOUTHERN CALIFORNIA OIL FIELD

offsets the advantages of the jack system. However, the determining factor in choosing between the two systems is not in the matter of first cost or pumping cost, but in the condition of the wells in the field. If the field is comparatively new and the production is high, as is the case in the Torrance field, and the wells require frequent cleaning, then individual motor-driven pumps have been found best and most economical on account of the expense of cleaning and bailing and pulling casings with portable rigs. The jack system is generally applicable only to older wells of low production.

In the Torrance field, where individual motors are used, the motors are of the double rated type, having a rating of 15 hp. at 480 r.p.m. for pumping and 25 hp. at 960 r.p.m. for bailing or cleaning or pulling casings. Tests show that the average demand of the motors when pumping is from 6 to 8 hp. One of the accompanying illustrations shows the motor and control apparatus for an individually driven well pump. All motors for this purpose are rated at 440 volts, three phase, and are of the variable-speed type. Service enters the pumping shed through conduit from overhead lines. Protection consists of a main line safety switch and oil circuit breaker with overload trip. Control apparatus consists of a cam-type controller for changing from six to twelve poles on the motor and a drum controller for varying the speed of the motor. The large counterbalanced wheel with crankshaft which operates the pump walking beam is driven through reduction gear and chain. The band wheel on which the crank is mounted is counterbalanced to give as nearly a uniform duty cycle on the motor as possible.

### ELECTRIC DEHYDRATION

A few years ago it was discovered that passing a high-voltage alternating current through oil emulsions would cause the minute particles of water to combine, forming larger and larger particles of water until globules are formed, after which the water is precipitated. This method of dehydration is patented and is now quite widely used by oil companies. One of the accompanying illustrations shows three petroleum rectifying dehydrators in the Torrance field. These dehydrators are purchased from the manufacturer, but are operated on a royalty basis at so much per barrel of oil treated.

For the month of June, 1927, 77,542 bbl. of oil was treated in the Torrance field, requiring 6,482 kw.-hr. of electrical energy, making the average cost per barrel for power 0.07 cent. Two test runs were made after the installation of the dehydrators to determine their effectiveness. The first test was on a sample of oil with high emulsion content. The data on this test follow:

| | Before Treating | After Treating |
|---|---|---|
| Specific gravity (deg. Bé.) | 22.63 | 24.13 |
| Per cent sand | 0 | 0 |
| Per cent free water | 0.2 | 0.2 |
| Per cent emulsion | 15.4 | 0.4 |
| Per cent total foreign matter | 15.6 | 0.6 |

Another test run on an oil sample with low emulsion content gave the following results:

| | Before Treating | After Treating |
|---|---|---|
| Specific gravity (deg. Bé.) | 21.78 | 23.55 |
| Per cent sand | 0 | 0 |
| Per cent free water | 2 | 0 |
| Per cent emulsion | 4.05 | 0.4 |
| Per cent total foreign matter | 6.05 | 0.4 |

This method of treatment has not been found to be so effective where the mud content in the oil is high.

Electric power is now widely used for main line pumping, or shipping stations as they are termed by oil men. At the Torrance field the output of the field is handled

COMPARATIVE STEAM AND ELECTRIC OIL WELL DRILLING COSTS
(Using Hild differential electric drive)

| | Feet Drilled | Drilling, Days | Feet Drilled per Day | Twist Offs | Power Cost | Power Cost per Foot Drilled | Power Cost per Day |
|---|---|---|---|---|---|---|---|
| Steam | 7,150 | 72 | 99.3 | 4 | $1,154.77 | $0.162 | $16 04 |
| Electric | 7,075 | 75 | 94.3 | 2 | 608.36 | 0.086 | 8.11 |

EQUIPMENT COST AND FIXED CHARGES

| | Wooden Derrick | Drilling Machinery | Supporting Equipment | Totals | | Depreciation Rate | Depreciation, Not Including Derrick | | | 6 Per Cent Interest on Investment Including Derrick | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | Without Derrick | With Derrick | Per Cent | Year | Month | Day | Year | Month | Day |
| Steam | $3,411.83 | $3,740.62 | $7,564.55 | $11,305.17 | $14,717.00 | 33⅓ | $3,768.39 | $314.03 | $10.47 | $883.02 | $73.59 | $2.45 |
| Electric | 3,545.73 | 15,562.18 | 3,420.52 | 18,982.70 | 22,528.43 | 20 | 3,796.54 | 316.38 | 10.55 | 1,351.71 | 112.64 | 3.75 |

SUMMARY—DAILY CHARGES (FIXED AND OPERATION)

| | Fixed Charges | | Extra Labor | Power Cost | Total |
|---|---|---|---|---|---|
| | Depreciation | Interest | | | |
| Steam | $10.47 | $2.45 | $15.75 | $16.04 | $44.71 |
| Electric | 10.55 | 3.75 | ...... | 8.11 | 22.41 |
| | | | | | $22 30 |

OIL FIELD TRANSFORMER INSTALLATION WITH RADIATING DISTRIBUTION LINES FOR SERVING INDIVIDUAL WELL PUMP MOTORS

by two motor-driven pumps. One of these is a 5x12-in. plunger pump driven by a 125-hp., 440-volt motor. Records for this pump, which is considered the most efficient, for June, 1927, showed:

| | |
|---|---|
| Total barrels of oil pumped | 121,932 |
| Total kilowatt-hours used | 20,140 |
| Total cost for power | $165.55 |
| Pumping cost per barrel, cents | 0.136 |
| Total hours operated | 464.17 |
| Average barrels pumped per hour | 263 |

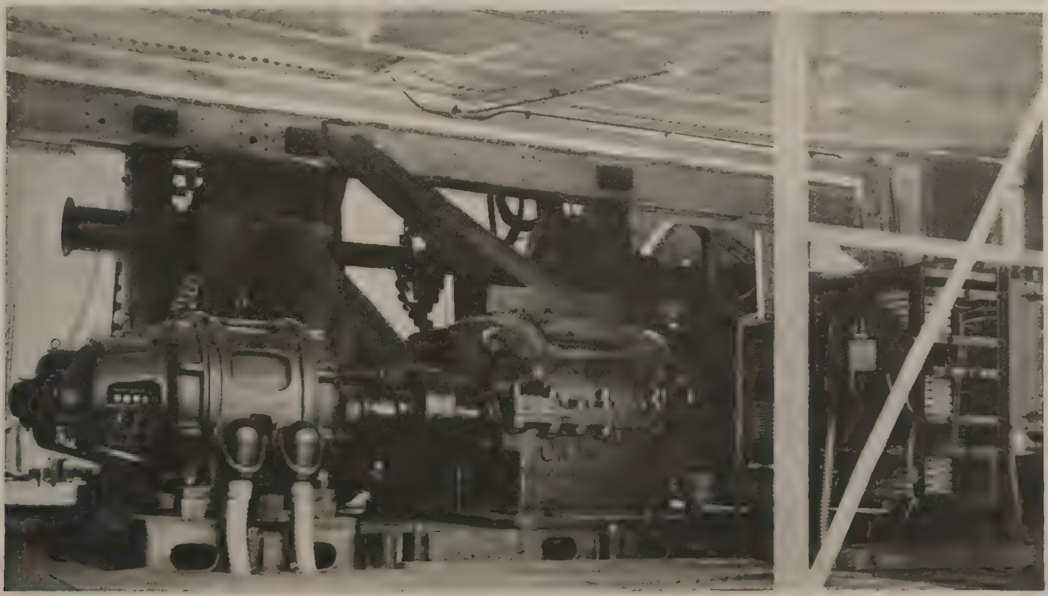
Pumping head varied from 100 lb. to 700 lb. per square inch. A test on this pump showed that it was capable of pumping an average of 288 bbl. of oil per hour against pressures up to 700 lb. per square inch at a cost of 0.1 cent for power, as compared with a cost of 1 cent per barrel of oil pumped for fuel alone when using a gas-fired steam boiler and steam engine-driven pump. All of the several types of pumps have been used for pumping oil, but experience shows that for general oil-field conditions the plunger-type pump is the most satisfactory and efficient. At refineries where comparatively clean oil is handled the screw-type pump is quite popular.

Electric drilling has been found so satisfactory and economical that steam is no longer considered except by those of the old school who are prejudiced. Records kept on two wells drilled with steam power and two drilled with electric power using the Hild differential drive at the Torrance field showed strikingly the economy of electric drive. Comparative data for the two methods of drilling are given in the accompanying tables. From these it will be seen that the total feet drilled by the two methods was practically the same and that under these conditions the net daily drilling cost, all items included, was $44.71 for steam and $22.41 for electric drive, or, in other words, steam-drilling costs were almost exactly double the electric costs.

Temporary power is supplied for the electric drilling rig by three 75-kw., 2,300/440-volt transformers mounted on a sled and inclosed by a wire screen as shown in one of the accompanying illustrations. The three-phase overhead line, which is later to be used for supplying the 440-volt pump motor, is used as a 2,300-volt circuit during drilling operations; thus temporary work for power supply is kept to a minimum.

Other illustrations show the Hild differential drive and the direct motor-driven mud pumps used in electric drilling operations.

Power for the Torrance field is purchased from the Southern California Edison Company at a centrally



HILD DIFFERENTIAL OIL WELL DRIVE

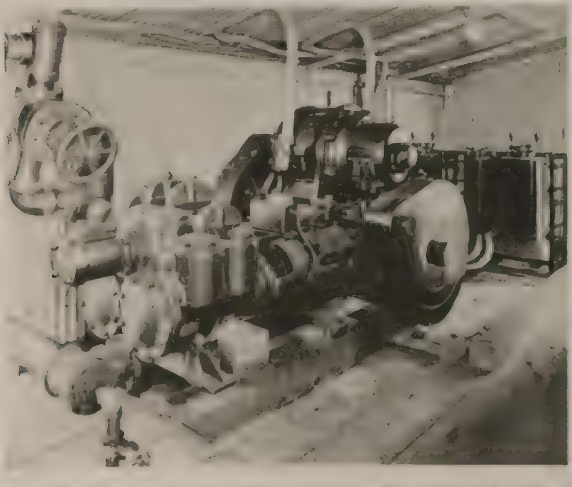
**Two 15-30-hp., 440-volt motors operate the drill through suitable reduction gears and chain drive. A cam-type contactor changes the motors from six to twelve poles. Nine points of speed control are obtained by a drum controller.**

TRANSFORMER BANK MOUNTED ON SLED SUPPLIES TEMPORARY POWER FOR ELECTRIC OIL WELL DRILLING EQUIPMENT

located substation, which is shown in one of the illustrations. The station contains six 1,000-kva. transformers fed from two 15,000-volt lines from different substations to insure uninterrupted power supply in so far as possible. The reason for having so much transformer capacity for a load of less than 2,000 kw. is so that if anything should happen to one 3,000-kva. bank, the other is available for carrying the load while replacement is made.

The transformers are Y-connected on the low side for 4,000-volt, three-wire distribution. The oil company's low-voltage bus is housed in a corrugated-iron building where meters, relays and low-voltage circuit breakers are housed as well. The power company furnishes a totalizing watt-hour meter and demand meter, which are checked by similar instruments owned by the oil company. A feeder switchboard consists of five panels for 4,000-volt feeders for power and three 4,000-volt feeders for lighting. An arrangement effective Aug. 1, 1927, makes it no longer necessary to meter the lighting and power separately and the separate lighting feeders are now unnecessary. Each feeder has a watt-hour meter and an ammeter and is provided with an oil circuit breaker with overload protection.

The 4,000-volt feeders consist of three No. 2/0 weatherproof wires radiating from the main substation to various parts of the oil field. Laterals are run from the main feeders to step-down transformer banks for supplying the pump motors. These transformer banks usually consist of three 50-kva. transformers centrally located with respect to six wells. Three-phase, 440-volt feeders radiate from the transformer banks, which in turn are tapped to serve the individual wells. Main secondary feeders consist of three No. 1/0 weatherproof wires, and for branches to individual wells No. 2 wire is used.



DIRECT GEAR-DRIVEN MUD PUMP FOR OIL WELL DRILLING USING A 15-35-HP. MOTOR. GENERAL PETROLEUM COMPANY

# Generator Inspections

By O. M. Ward

*Assistant Electrical Engineer Milwaukee Electric Railway & Light Company, Milwaukee, Wis.*

INSPECTIONS on all generators, motor-generators, rotary converters and exciters in the system of the Milwaukee Electric Railway & Light Company are specified and noted on the report here reproduced. Inspections are made on direct-current machines at intervals of two months and on alternating-current machines at six-month intervals. This information regarding machines, inspection periods, and the following quoted notes, are printed on the back of the form, which is a mimeographed sheet measuring 8½x5½ in.:

By "air gap, right" is meant the right-hand side of the unit when looking toward the machine from the end that gives clockwise rotation.

Ground tests on direct-current machines will be made with a voltmeter and the number of the meter, the meter reading and the voltage at which the test is made must be given. This test will include the armature, field and cables, unless otherwise stated.

Ground tests on alternating-current machines will be made with a megger.

Reverse-current relay tests will be made by reversing the machine and noting at what current the relay operates.

Overspeed tests are to be made only on all-electric machines. The series field must be cut out before driving a generator as a motor for the purpose of overspeeding.

# Quality Industrial Lighting*

Field research in many industrial plants shows factors of illumination intimately related to production. Results establish standards for practical use

By Arthur A. Brainerd
*The Philadelphia Electric Company, Philadelphia, Pa.*

DURING the past few years many experiments have been made both in the laboratory and in the field to determine the exact effect of lighting on manufacturing operations. As a result of these tests, backed by such pertinent statistics as were available, the following advantages have been claimed for scientific artificial illumination:

1. Increased production.
2. Decreased labor turnover.
3. Decreased accidents.
4. Decreased spoilage.
5. Improved morale.

A study of these items will show that to assign accurate numerical values to statements 2, 3 and 5 is a very difficult task, involving the study of records covering a period of several years. Items 1 and 4, however, are comparatively easy to determine within a very short space of time if the operation is repetitive and if it is necessary to rely upon artificial illumination to any great extent.

### Essentials of a Good Lighting System

A study of previous investigations of the effect of light on manufacturing operations revealed the fact that a majority of the cases studied dealt with purely hand operations, where operators were on a day-rate basis. In many cases the change was ascribed entirely to the change in intensity of illumination, although several other variables had been introduced, such as change in color and elimination of direct and reflected glare and sharp shadows.

Secondly, a careful investigation shows that for the Philadelphia area at least 76 per cent of the industrial work is done on semi-automatic or automatic machines and only 5 to 45 per cent of the time is spent on hand operations.

A consideration of these facts seemed to indicate that much remained to be done to place our present knowledge of illumination in such form that it will be readily understood and appreciated by the industrial executive.

In designing an industrial lighting system the following factors should be taken into consideration:

1. Intensity of illumination.
2. Uniformity of illumination.
3. Character and direction of shadows.
4. Character and direction of reflections.
5. Color of light source.
6. Maintenance and extensions.
7. Initial and operating cost.

The intensity of illumination to be used depends upon the visual angle, the reflection factor of the surfaces viewed, contrast in reflecting properties between material viewed and background, the value of product as related to floor area, percentage of window area, intensity and direction of natural light and the speed at which objects are moving.

In many lighting installations the results are unsatisfactory because of excessive variation in light intensity within the working areas and not because of insufficient intensity. Almost any operation can be lighted so that the variation factor within the working area shall not exceed 1.5. In many lighting installations today this factor has a value of 5 or over.

Since in most industrial establishments the surrounding conditions are such that it is impracticable to produce shadowless illumination, care must be taken to see that the shadows fall in such a direction as to do the least damage.

The same care must be taken in dealing with conditions where polished surfaces (such as a lathe chuck or face plate) normally come in the field of vision. Under such conditions the light should come from such a direction as to throw the direct reflection away from the worker's eyes.

In certain operations such as sorting cigars, inspecting cloth, coffee roasting, mixing paints, etc., it is absolutely necessary that light of the correct color value be provided. It goes without saying that as far as possible standard equipment that can be easily duplicated for extensions or replacement should be used. The equipment should be rugged in construction and easily cleaned.

It has generally been assumed that in order to satisfy these conditions direct lighting by means of metal reflectors is the only practical system to be considered in manufacturing operations, this being the best combination of low first cost, high efficiency and ease of maintenance. As a matter of fact, if the expenditure for equipment be considered on a cost basis, it will be seen that the fixed charges on lighting equipment will seldom exceed 10 per cent of the total operating costs, so that if more satisfactory illumination can be secured by the use of more expensive equipment it should be used. The fact that this idea can be sold is well illustrated by one case where a plant manager replaced bare drop lights with fixtures costing $20 apiece and was perfectly satisfied with the result.

Although the RLM dome and the "Glassteel" diffuser will undoubtedly satisfy 70 to 80 per cent of the lighting requirements in factories, all types of illumination can be used to advantage in some of the remaining 20 to 30 per cent.

---

**Abstracted from a paper by the author entitled "Quality Measurements in Industrial Lighting Calculations," which received the James H. McGraw N.E.L.A. award for merit.*

With the idea of studying these phenomena under commercial conditions, thirteen plants were selected where adequate records were available and arrangements could be made to carry on investigations that were sufficiently comprehensive. The real object of these tests was to secure data that would enable us to place industrial lighting recommendations on a more exact basis than is the present rule.

The numerical results of these tests are given in the accompanying tabulations, which include all the observed and derived data obtained for the several factors considered in this connection.

The general plan has been to study one machine or a group of machines and one or two operators. Where the regular factory records were sufficiently accurate and complete, these were relied on. In other cases a trained observer secured all necessary records. In investigations of this nature it is unavoidable that variables other than illumination creep in. These variables include such items as outside influence affecting physical ability, lack of uniformity of raw material, variation in distance of eyes from work, consciousness of close supervision, prejudice against any sort of change, influence of union officials, etc.

Another item that has an important bearing on the subject is handwork that mainly involved manual skill. In many cases only careful analysis by the aid of slow motion pictures would enable one to determine the actual percentage of handwork that involves seeing.

Since most of the operations studied were on automatic or semi-automatic machines, it became necessary to develop some formula for the variation in speed of handwork. In any mechanical process, if the machine runs at constant speed, it is obvious that while the machine is running the output is uniform. Theoretically

* H.H. = Hanging height.

this would be true if the operation were carried on in total darkness, and the only improvement that better illumination could produce would be to speed up adjustments when the machine is not running.

Let $M_1$ represent the percentage of time during which the machine is running and $m_1$ the percentage of time spent in hand adjustments with the machine stopped. It is quite evident then that $M_1K$ is equivalent to the amount of handwork completed and $m_1k$ is equal to the time spent in doing this work, where $K$ and $k$ are constants depending upon the nature of the task. If we take speed as the reciprocal of time, it is evident that $\frac{M_1}{m_1} K =$ the speed of handwork where $K$ is a constant.

If by the use of better illumination we succeed in reducing the percentage of time spent in making hand adjustments so that the ratio now becomes $\frac{M_2}{m_2} K$, it is evident that:

$$100 \times \left( \frac{\frac{M_2}{m_2} K - \frac{M_1}{m_1} K}{\frac{M_1}{m_1} K} \right) = \left( \frac{M_2 m_1}{M_1 m_2} - 1 \right) \times 100 =$$

per cent increase in speed of handwork.

For example, suppose that a loom is operating 80 per cent of the time, the remainder being spent in hand adjustments, and by means of good illumination this percentage is increased to 85. Then the increase in speed of handwork would be:

$$\left( \frac{85 \times 20}{80 \times 15} - 1 \right) \times 100 \doteq 41.5 \text{ per cent.}$$

From this equation it is quite evident that where a large percentage of the operation is automatic, it is necessary to bring about a very large increase in speed of handwork if we are to show any appreciable net increase in production.

### Discussion of Results

*Shadows and Production.*—A careful study of cases 13 and 14 (the Sidebotham mills, see Table I) will show that a mere raising of average intensity of illumination had very little direct effect in improving production. In fact some preliminary figures taken at this plant seemed to indicate, notably in the case of the "Glassteel" diffuser, that increasing intensity served merely to make the shadows harsher. The following records will give some idea of the close relation between production and shadows:

| System | Average Foot-Candles | Variation Factor | Production Increase, Per Cent |
|---|---|---|---|
| Bare drop | 6.78 | 1.48 | 0 |
| Glassteel | 19.8 (harsh shadows) | 3.85 | Negligible |
| RLM | 12.32 | 1.46 | 3.85 |
| Indirect | 7.9 | 1.09 | 7.70 |
| Indirect | 12 | 1.09 | 11.00 |

These results are confirmed by the following figures taken from cases 17, 18 and 19 (the American Metal Works):

| System | Average Foot-Candles | Variation Factor | Production Increase, Per Cent |
|---|---|---|---|
| Deep bowl reflector with bare lamps | 11.6 | 1.94 | 0 |
| RLM (BE lamps) | 7.4 | 1.21 | 2.25 |
| RLM (BE lamps) | 14 | 1.3 | 6.73 |
| RLM (BE lamps) | 20 | 1.3 | 12.35 |

In both cases it will be noted that production was increased by reducing shadows, even when the foot-candle intensity was lowered. After objectionable shadows had been eliminated production increases were consistent.

These results are further confirmed by those at the Martell mills. Here variation factor was reduced only from 2.3 to an average of 1.3 and the variation range from 7.5 to 1.7. A production increase of 7.8 per cent was then noted. After this change had been made no consistent difference in speed of work was noted at several illumination levels varying from 7 to 40. This was also true in case 6 (the M. J. Smith Belting Company), where variation factor was reduced from 1.8 to 1.35, and case 5, where the variation factor was reduced from 1.4 to 1.1.

In cases 3 and 4 (the Realart Silk Hosiery Company) the variation factor was reduced from 1.6 to 1.4 in the daytime and from 2.2 to 1.4 at night. The fact that production could be increased 3.9 per cent in broad daylight where the natural illumination was excellent and the only function of artificial lighting was to dispel the shadow of operator, caused by the vertical windows, demonstrates conclusively the important relation that exists between shadows and production. The higher percentage of increase on the night shift, when the shadows are more dense than in the daytime, also serves to illustrate this point.

A study of the tabulated records shows that in practically every case the change to a modern system of illumination involved a substantial decrease in variation factor, all of which goes to show that proper distribution and diffusion of light are of fully as great importance in production operations as mere light intensity, if not of greater importance.

*Direction and Character of Reflections.*—We frequently hear the statement made that in case of doubt a uniform system of 200-watt RLM's on 10-ft. centers is good illumination. One of the objects of this series of tests was to find sales arguments that would enable us to convince officials of machine tool shops that their lighting problems could best be solved by means of fixed overhead units instead of adjustable drop lights. Experiments in this direction were commenced in the plant of the Progressive Foundry & Machine Company.

Since this shop was engaged in experimental work, it was not possible to get any exact figures on production. Careful tests conducted with an experienced machinist showed that 20 to 25 foot-candles of well-diffused light was necessary to read a micrometer and set a tool to the best advantage.

In order to throw the reflected images of the lighting unit away from the operator, the best position of the unit was fixed at 8 ft. above the floor directly over the operator's right shoulder. A 150-watt bowl enameled lamp in an RLM dome gives excellent results when the lamp is new and the reflector is clean. This method was tried in several jobbing machine shops with lathes, millers and shapers. In the case of small planers, the unit was mounted directly above the bed.

In order to verify the correctness of these deductions two tests were later conducted, one on a drill press at the plant of D. W. Flower and the other on a turret lathe at the plant of the American Metal Works. The factory records for the drill press showed a production increase of 3 per cent, although the foot-candle intensity was increased only from 3.4 to 8.7. Due to lack of uniformity of tasks performed there was no opportunity to check the figures.

The test on the turret lathe was conducted under more favorable conditions and the results were even more significant. When the glare conditions were corrected and shadows reduced and directed in such a manner as to do the least harm, the production was increased 2.25 per cent, although the foot-candle intensity was actually reduced from 11.1 to 7.7. When the proper distribution of light had been secured, raising the foot-candle intensity to 20 increased the production 12.35 per cent above what it was under the old conditions.

Our experience in various industries has convinced us that in a very large percentage of plants each machine or group of machines or operations should be considered as a unit by itself and be lighted by fixed units of relatively high power. This makes it possible to give the proper consideration to reflections, also high-intensity light can be concentrated in the working area. A fixed unit is in most cases preferable to an adjustable unit, since experience shows that rarely does an operator possess the ability to keep an adjustable unit in the correct position. It is much better to find the best all-around position for lighting unit and keep it there than to allow every operator to adjust the lights. We cannot expect a machinist to be an illuminating engineer.

*Character and Reflection Factor of Surfaces in the Field of Vision.*—Closely allied to the foregoing items is the question of contrast in reflection factor between the work and the background. It is of course self-evident that black on gray cannot be seen as easily under a given condition of illumination as black on a white background. A much higher intensity is necessary to secure the same degree of visibility in the former case. It is to be expected therefore that these tests would show

## Table II—Illumination Details of Fourteen Factories Studied

| Name | Present Illumination | | Variation Factor | Shadows | Reflection | Background Contrast | Visual Angle in Minutes | Natural Illumination | Calculated | Actual | Per Cent Error |
|---|---|---|---|---|---|---|---|---|---|---|---|

| Decorative Lamp, metal | Bad | Fair | 5 | 5 | 0 | 2.5 | 4 | 5 | 21.5 | 18 | +19.4 |
| B. Wilmsen | Bad | Excellent | 0 | 7.5 | 10 | 10 | 4 | 0 | 31.5 | 46 | —31.5 |
| Average error, per cent | | | | | | | | | | | + 6.66 |

some indication of the practical importance of this particular item. Referring to Table I, we see that all the seven cases where the background contrast was more than 35 per cent (Nos. 1, 6-11, 13-14, 16, 17-19, 20 and 22) showed increases in speed of handwork of 20 per cent or over (contrast as used here is minimum reflection factor divided by the maximum). These figures prove beyond a shadow of doubt that background contrast has an influence on the character of the lighting system required and must be considered in laying out any system of productive illumination.

Dr. Ferree and Dr. Rand in a paper read before the 1926 convention of the Illuminating Engineering Society showed that the illumination intensity necessary to secure maximum speed of vision varies widely with the difference in brightness between the object viewed and the background. The highest contrast values used in their tests correspond to a value of 25 per cent as recorded in this paper. But even at this value and with a visual angle of one minute, it was necessary to employ an intensity of 68 foot-candles before the speed of vision curve began to flatten out.

The practical value of this phase of the problem was especially noticeable in two cases, although no extensive tests were conducted. One was in case 13, where a piece of black oilcloth used as a background for white yarn greatly lightened the task of perceiving broken ends. The other was in the case of a surface grinder in a linotype factory. Here the operator fastened a piece of white paper as a background for his grinding wheel. Improvement in the quantity and quality of his work was noted.

*Visual Angle and Illumination.*—Visual angle has always been recognized as having an important bearing on the character of illumination. The following figures are taken from five different textile mills where the handwork is similar in character:

| Location | Visual Angle, Minimum | —Foot-Candles— Old | New | PerCent Increase in Speed of Handwork |
|---|---|---|---|---|
| Realart | 0.552 | 7.2 | 17.3 | 25.8 |
| Sidebotham | 0.942 | 6.8 | 15.5 | 48 |
| Shenn Mfg | 1.21 | 3.3 | 10 | 150 |
| Smith, M. J | 2.2 | 1.9 | 9.7 | 18.5 |
| Reid | 5.83 | 6.2 | 17 | 370 |

In each of these cases the illumination was very bad. A glance at the figures will show that for angles of 0.5 minute and above there is no reason to believe that illumination will speed up production more with a small visual angle than with a large angle. Of course these results cannot be taken as meaning that visual angle has no bearing on the behavior of a lighting system, but rather that visual angle is by no means the deciding factor.

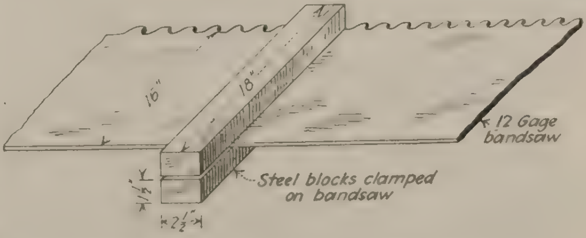
Dr. Ferree and Dr. Rand in the paper referred to have also shown that higher intensities of illumination are absolutely necessary as the visual angle decreases, if we are to maintain the same speed of vision.

In attempting to reconcile these results with practice, however, we find that since the visual angle varies so widely every time the worker moves his head, it is almost impossible to strike a fair average by any method developed up to the present time. This will partly account for some of the discrepancy between the results of this investigation and the findings of Dr. Ferree.

The second part of Mr. Brainerd's paper, giving illustrative examples of practical applications in quality industrial lighting, will appear in an early issue of ELECTRICAL WORLD.

## Reducing Sawmill Fire Hazard

REDUCED fire hazard, absence of scale, cleanliness and greater uniformity of welds are factors that are leading sawmills of the Pacific Northwest to use electric muffle furnaces in the saw-filing shop for annealing silver-soldered joints in band saws. The usual practice is to replace the small blacksmith's forge with a standard 7½-kw., 220-volt, non-automatic muffle furnace for heating the annealing blocks. After a band saw has been mended with silver solder the steel-annealing blocks, which have been heated to a temperature of 1,600 deg.



METHOD OF APPLYING ELECTRICALLY HEATED STEEL BLOCKS TO HEAT TREATING OF BAND SAW JOINTS

C. in the furnace, are clamped onto the saw and allowed to remain for about 30 minutes while cooling and completing the heat-treating process. About 1½ hours of pre-heating of the blocks in the furnace is required to raise them to a uniform temperature of 1,600 deg. C.

Energy consumption is of secondary importance when the advantages of the electric furnace are taken into consideration.

## Cable Layout Aids Splicers

By T. W. Swartz

*Assistant Engineer Underground Department, Northwestern Electric Company, Portland, Ore.*

FURNISHING cable splicers with a cable layout, such as that shown in the accompanying diagram for a transformer vault, has been found by the Northwestern Electric Company, Portland, Ore., to result in a much neater, safer and more economical job. As will be seen from the diagram the four walls and floor of the vault are laid out in the same plane. This gives the splicers a picture of what the cable layout should look like when the vault is completely wired and enables them to go about their work in an orderly and efficient manner.

OFFICE PLANNING OF VAULT CABLE LAYOUT SAVES TIME AND AVOIDS CONFUSION IN THE FIELD

List of Material

| Number | Description |
|---|---|
| 2 | 25-kva. constant current transformers |
| 1 | 20-kva. constant current transformer |
| 3 | 15-kva. constant current transformers |
| 2 | 400-amp. oil switches |
| 12 | 50-amp. oil fuse cutouts |
| 6 | Subway controllers |
| 12 | Disconnecting potheads, 100 amp |
| 2 | 200-volt-amp. potential transformers |
| 2 | 100-amp. current transformers |
| No. 2 | Three-conductor, 2,400-volt lead cable |
| No. 2 | One-conductor, 2,400-volt lead cable |
| No. 8 | One-conductor, 5,000-volt lead cable |
| No. 10 | Duplex lead control cable |
| 1 | 24-in.x48-in.x12-in. instrument transformer box |
| 1 | 12-in.x26-in.x6-in. metal box, vault-service |
| 1 | 60-amp., three-pole S.T. switch-motor control |
| 1 | 30-amp., three-pole S.T. switch |
| 1 | 30-amp., two-pole fuse block for vault-lights |

Formerly it was left to the cable foreman to work out his own vault cable plan in the field. This method has given way to the present plan, whereby careful engineering in the office in advance avoids lost time and confusion in the field. This plan has been followed for several years and is particularly advantageous for large and complicated vault layouts.

## Restoring Service After Flood at Burlington

DURING the flood in the Winooski Valley of Vermont last November the water rose 27 ft. above the crest of the dam at the Gorge plant of the Burlington Light & Power Company, flowing over the roof of the old 1,500-kw. hydro station and submerging the condenser pump of the 2,500-kw. auxiliary steam plant, which was safely located on the west bank of the Winooski River. The 4,800-kw. station at Essex was flooded from the tailrace back-up to a depth of 20 ft. above the operating room floor. Essex was shut down at 4:30 a.m., Friday, Nov. 4, and as the Gorge hydro plant was also flooded it became necessary to concentrate energy first upon putting the auxiliary steam plant in service at the top of the Gorge. This steam plant had not been in operation for a month and the boilers were in winter quarters, as it were. The main boiler-feed pumps were under water in the old Gorge plant. By 1 p.m., Friday, the steam plant was put in service, running non-condensing and supplying a load of about 800 kw. to such important customers as the newspapers, bakeries, two hospitals and the U. S. Army post at Fort Ethan Allen. Feed water was obtained by a 3-in. connection with the Winooski municipal water system. On Saturday the water had run out of the Gorge hydro station sufficiently to permit operating the feed pumps and the load was increased to 1,200 kw. By Monday it was possible to operate condensing in time for supplying the power load. Material aid was given, through a tie line, by the Vergennes plant of the Peoples Hydro-Electric Vermont Corporation during the first week after the flood, and efforts were made to obtain help from the city steam plant at Burlington, but these were unsuccessful. The interconnection with the Fairfax plant of the Public Electric Light Company of St. Albans did not serve as the generators of the latter were wet and trouble occurred from coil burnouts.

Rehabilitation of hydro-electric supply was based upon the plan of putting an engineer and four expert wiremen at each station, with the added help of General Electric wiremen and winders on apparatus. The U.G.I. interests of Philadelphia sent engineers and wiremen to Burlington and the entire construction crew at work on the new 3,000-kw. Gorge hydro-electric development opposite the old Gorge station was turned over to the rehabilitation job. These men moved an 8-in., 50-hp. motor-driven condenser pump from the Gorge to Essex and installed this with two other pumps to help clear the station. The company's river crossing between the Gorge and Essex was washed out and a temporary line was shot across by the Burlington company's line department in co-operation with the New England Telephone & Telegraph Company's field forces and put in operation by Sunday evening.

Before power was obtained efforts were made to siphon out the water from the Essex station, using fire engines and sewer pumping outfits. The large motor-driven pumps rapidly lowered the water level, and on Sunday night it was all pumped out, leaving 2 ft. of mud on the floor under a great mass of lumber and refuse which the flood had carried in through the windows. Seventy men were put in the plant to carry out the refuse, shovel the mud into barrows and wheel it up runways to the windows overlooking the tailrace, whence it was ejected.

At the same time the apparatus was being washed out with water under pressure. Twelve salamanders were assembled by punching holes in transil oil drums, inserting a home-made grate of flat rods in each and mounting on non-combustible bases, coke being used as fuel. Six of these outfits were also built for the Gorge plant. Windows were boarded up, electric ovens built and the drying out process started. By Tuesday morning the floor at Essex was dry and two loads of sawdust were put down. One generator and one waterwheel-driven exciter were boxed in and external heat applied by using trolley car heaters, bathroom spot heaters, etc., and these machines were running on dry-out five days after the shut-down.

About 2 miles of 33-kv. and 13-kv. lines were down between Essex and Montpelier and this reconstruction was accomplished by a line crew and truck sent to Vermont by the Suburban Counties Company, despite great handicaps in highway communication. A truck with an exciter, oil drier, megger, transformers and tools was also sent to Burlington from the U.G.I. headquarters. This exciter made it possible to carry load at Essex fourteen days after the machines were submerged.

At the Gorge plant water poured in the upstream windows behind the switchboard, but due to the floor openings to the tailrace water did not stand very deep (about 2 ft.) on the floor and ran out as soon as the flood subsided. One generator at the Gorge hydro plant was put in service Nov. 13 and all machines were available Nov. 20 at Essex. The first machine went back into service on the same day. At both plants it was necessary completely to rewire all panels and to renew all non-lead-covered cable and control wire. A good feature at Essex in the original plant design was the use of lead-covered cable and potheads on the generator and exciter leads and of lead-covered wire for station lighting. It was possible to salvage most of the equipment, including 87 out of 90 instruments and meters.

Equipment that could not be salvaged on the job included potential transformers and the majority of current transformers, bellows type relays and some shunt field coils on exciters. One field winding on an Essex generator had to be reinsulated from the pole piece, and it is expected that next summer the other machine fields will have to be similarly treated.

ILLUMINATION IN METER DEPARTMENT WAS DESIGNED FOR THE DETAIL WORK INVOLVED

# Modern Lighting in a Service Building

By Willard Allphin

*Lighting Engineer*

*Fall River (Mass.) Electric Light Company*

THE new service building of the Fall River Electric Light Company is equipped with lighting of the most approved type, not because of the advertising value of high intensity illumination, but because executives of the company are convinced that good lighting will pay dividends in safety and comfort for the workers, and in increased production. The illumination in any room is no more elaborate than could be conscientiously recommended to a customer for the same type of room.

DARK CORNERS AVOIDED IN REPAIR SHOP

The main office is lighted by 300-watt totally indirect fixtures of the luminous bowl type. These are mounted on 11x12-ft. centers and give an intensity of 12 foot-candles on the usual plane 30 in. above the floor. The drafting room is lighted to an intensity of 25 foot-candles by 500-watt totally indirect, opaque bowl fixtures, on 11-ft. centers. The distribution superintendent's office contains two 300-watt totally indirect units of the luminous bowl type, giving an intensity of 12 foot-candles. The other private offices differ only in being smaller and containing but one fixture. In the main section of the meter department, 200-watt RLM domes are used on 10x11-ft. centers, providing 10 foot-candles of light.

WORK ON STREET-LIGHTING EQUIPMENT MADE EASIER BY ADEQUATE ILLUMINATION

High intensity lighting for fine repairs is provided by two 500-watt "Glassteel" diffusers which give an intensity of 30 foot-candles. Over the meter racks, 200-watt extensive type prismatic reflectors are used to obtain 8 foot-candles on the vertical surfaces of the meters. Illumination in the street lighting department, the underground department and all similar shops and workrooms is furnished by 200-watt RLM domes.

Bowl white lamps are used throughout in all RLM domes, and all direct reflectors are suspended on conduit with aligners at the outlet boxes. Mounting heights are consistent with the rule that the spacing shall not be more than one and one-half times the mounting height above the working plane. Duplex convenience outlets were installed liberally throughout the building.

Our janitor has been carefully instructed in the methods of cleaning the various types of fixtures and is required to sign a cleaning chart, ruled for months and rooms, each time he cleans the fixtures. The foreman in charge of the building sees that each square is signed every month.

Although the lighting was put in entirely on its own merits, it has been found a valuable sales help in demonstrating office, drafting room and industrial lighting to customers. The cost of the lighting installation was 4 per cent of the total cost of the building.

## Substation Has Publicity Value

By Stanley Stokes

*Power Supervisor Union Electric Light & Power Company*
*St. Louis, Mo.*

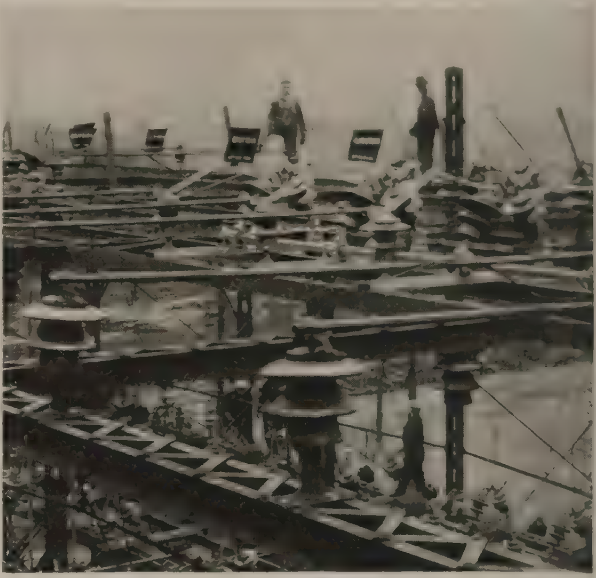
A CONSPICUOUSLY good example of bringing to the public consciousness at least one phase of the utility business is afforded by the Cahokia substation of the Union Electric Light & Power Company at East St. Louis, Ill. This station, which is an impressive structure by day, becomes more spectacularly interesting at night, when it looms up out of the darkness under well-designed and adequate illumination.

Nineteen floodlighting units are used, eleven 500-watt lamps being placed along the top of the structure and on the fence and eight 200-watt sources at a lower level. An energy consumption of 8.1 kw.-hr. per hour offers a strikingly vivid and convincing advertisement of electric service. Since the lighting is a necessary part of the station-operation equipment, its installation cost can be so charged, leaving the energy as the sole cost of the advertisement.

FLOODLIGHTS TRANSFORM SUBSTATION TO A CONSPICUOUS UTILITY ADVERTISEMENT

## Safety for Outdoor Substations

PROTECTION for operating and maintenance men in outdoor substations is one phase of the safety work of the Utica Gas & Electric Company, Utica, N. Y. This activity is under the direction of N. E. Emmons, superintendent of maintenance. Red flags are suspended around roped-off areas in sections where work is being done in outdoor substations and it is the duty of the safety guard in charge to see that these boundaries are not overstepped. Insistence upon safety is the sole function of this man and his word is final. The only way in which his orders can be negated is by removing him from the job under orders of the superintendent of maintenance or general superintendent. The results of this plan have been highly satisfactory in reducing accidents.



SAFETY MAN ESTABLISHES WORKING ZONE

In this 44-kv. yard the flags on a rope fence mark working limits. The safety man who is always on every job of such a nature stands close to the column. Only the particular bay on which the men are working is dead. The boundary flags constitute the "dead line" on both the second and top elevation of the structure.

This company also follows the somewhat unusual procedure of testing rubber gloves and protectors weekly. The expense of this work is, of course, greater than where the tests are not performed so frequently, but defective material is encountered upon every weekly test, indicating the value of such frequent checks.

All equipment is fully labeled in outdoor substations. Warning signs for company men, indication of duty of all equipment, line and phase notations and opened and closed positions of all operating levers are clearly marked. Phase designations are shown on each breaker tank as well as under the buses, thus minimizing errors in cutting in a new job. A red circle with an arrow is placed on the oil switch housing. There is also a red light in connection with this particular location. These are to draw attention to the emergency handle for the oil circuit breakers.

# Protective Grounding

## A discussion of the recommended practices of the National Electrical Manufacturers' Association

### By S. W. Borden*

TO ESTABLISH uniform methods of construction and installation which will do away, in so far as possible, with electrical fire and shock hazards the National Electrical Manufacturers' Association has recently studied and approved certain practices for protective grounding. The recommended practices of the N.E.M.A. are given elsewhere on this page. The desirability of protective grounding is generally conceded, and the circuits installed for this purpose are often referred to as "safety circuits." The greatest single element of resistance in a safety circuit is usually the resistance to the flow of current away from the earth electrode into the surrounding earth. Urban and most suburban districts are equipped with general water-supply systems which, for the most part, constitute an adequate, economical and convenient earth electrode for electrical safety circuits. In rural and farming districts and in some industrial establishments where no such suitable earth electrode is available an artificial ground must be resorted to.

Fig. 1 is a schematic wiring diagram which is more or less characteristic of industrial-plant installations. The effectiveness of any system of protective grounding depends upon its ability to provide protection under both normal and abnormal conditions and to remain intact and in proper working order irrespective of such changes in the wiring system itself as are liable to take place in the normal course of operation. The most severe abnormal conditions are encountered when the higher voltage of a primary system, a series street-lighting system or a trolley feeder finds its way to the secondary wiring, or when a failure occurs in the insulation of a wire in a metal wire inclosure or in the insulation of some appliance or equipment which permits one of the conductors to come into contact with the metal inclosure. The more common changes in the wiring system which may be expected are the reversal of a pair of wires or the open-circuiting of a conductor either by the blowing of a fuse or otherwise.

When the safety circuit consists of the metal inclosure of the conductors there is little possibility of the safety circuit conductor and a working conductor being transposed. When a copper safety circuit is installed its use is obvious, and while electricians and laymen alike are accustomed to arranging two wires more or less indiscriminately, they are also accustomed to arranging three wires systematically since three-wire circuits must be so arranged to be operative. Safety-circuit conductors are clearly identified, as are the safety poles of plugs and receptacles, such poles being marked "Ground." It is suggested that "Safety" is a better marking, because "Ground" may be confused with "grounded wire."

Under normal conditions the neutral or white wire, which is connected directly to the water-piping system, is at earth potential. All of the metal work is likewise at earth potential. Between each of the other wires of the system and the earth there is a potential of 110 volts or more, and a person touching either of these wires, or anything in direct contact with these wires, is liable to receive a shock. There is no known method of effectively eliminating this latter hazard, but it may be reduced to a minimum by means of identified, polarized wiring.

Assume that a high potential from the primary system finds its way to the secondary system and a current flow of 50 amp. takes place. If the ground resistance is 2 ohms, then the grounded-circuit conductor will be raised to a potential above ground of 50 × 2, or 100 volts, and

## *Recommended Practices*

1. Wiring systems should be grounded "where" and "as" required by the National Electrical Code.

2. Non-current-carrying exposed metal parts of fixed equipment, etc., in industrial domestic and other locations should be grounded, with exceptions under certain conditions. Such an allowable exception might be for outlet boxes, fixtures, etc., in rooms of frame dwellings where containing no metallic piping or fixtures connected thereto.

3(a). In industrial locations, except offices, public utility stations and for industrial usages which have certain conditions and are therefore exempted, non-current-carrying exposed metal parts of detachable (portable) equipment should be grounded.

Exempted, except in hazardous, extra-hazardous and conductive locations, are detachable appliances which are not operated above 150 volts and inherently are sufficiently safeguarded against probability of harmful leakage from their exposed metal parts to persons or objects by reason of either (1) their infrequency of handling, (2) their assured degree of insulation between live parts and exposed metal parts, or (3) their inherent characteristics, leading to improbability of exterior metal parts touching persons or objects in such a way as to harm them.

Examples (1) General purpose ventilating fans; (2) "approved" general-purpose pressing irons.

3(b). In office, utility and dwelling locations, and in all other locations except industrial ones, non-current-carrying exposed metal parts of detachable equipment should be grounded where operating at over 150 volts.

3(c). In office, utility and dwelling locations, and in all other locations except industrial ones, non-current-carrying exposed metal parts of detachable equipment, where operating at less than 150 volts, need not be grounded.

4. Conduit with fittings, armored cable sheath with fittings, metal raceway with fittings, and a safety grounding wire suitably identified as such and run with the system conductors, may be used as the grounding medium for equipment ground, or as a portion of such grounding medium, "where" and "as" provided for in the National Electrical Code.

5. No current-carrying conductor of an interior wiring system should be used as a grounding medium, or portion therefor, to ground fixed or detachable equipment.

---

*Mr. Borden is a member of the N.E.M.A. grounding committee, a member of the grounding committee of the International Association of Municipal Electricians and a member of the grounding committee of the New York Chapter of the Eastern Association of Electrical Inspectors, and he has devoted a great deal of his time to the study of the grounding problem.

the other conductors will have a potential above ground of 210 volts. The only way in which this rise of potential can be kept within safe limits is by keeping the resistance of the secondary ground circuit sufficiently low. However, where the N.E.M.A. grounding method is followed the equipment frames will remain at earth potential, unless a breakdown occurs in the insulation.

If the insulation on one of the ungrounded circuit wires becomes defective and the circuit wire comes into contact with a grounded metal inclosure, the result would be a short circuit, which would blow the fuses in the ungrounded conductor unless the resistance of the safety circuit provided was so high that the resulting current was limited to an amount insufficient to blow the fuses. With any of the metallic inclosures which are recommended by the N.E.M.A. as suitable safety circuits this condition would not exist, except possibly in the case of an exceptionally long circuit of certain types. If the fuse should not blow, the metal inclosures will assume a potential above earth equal to that of the conductor with which it is in contact, which again emphasizes the fact that the effectiveness of a safety circuit is dependent upon its resistance.

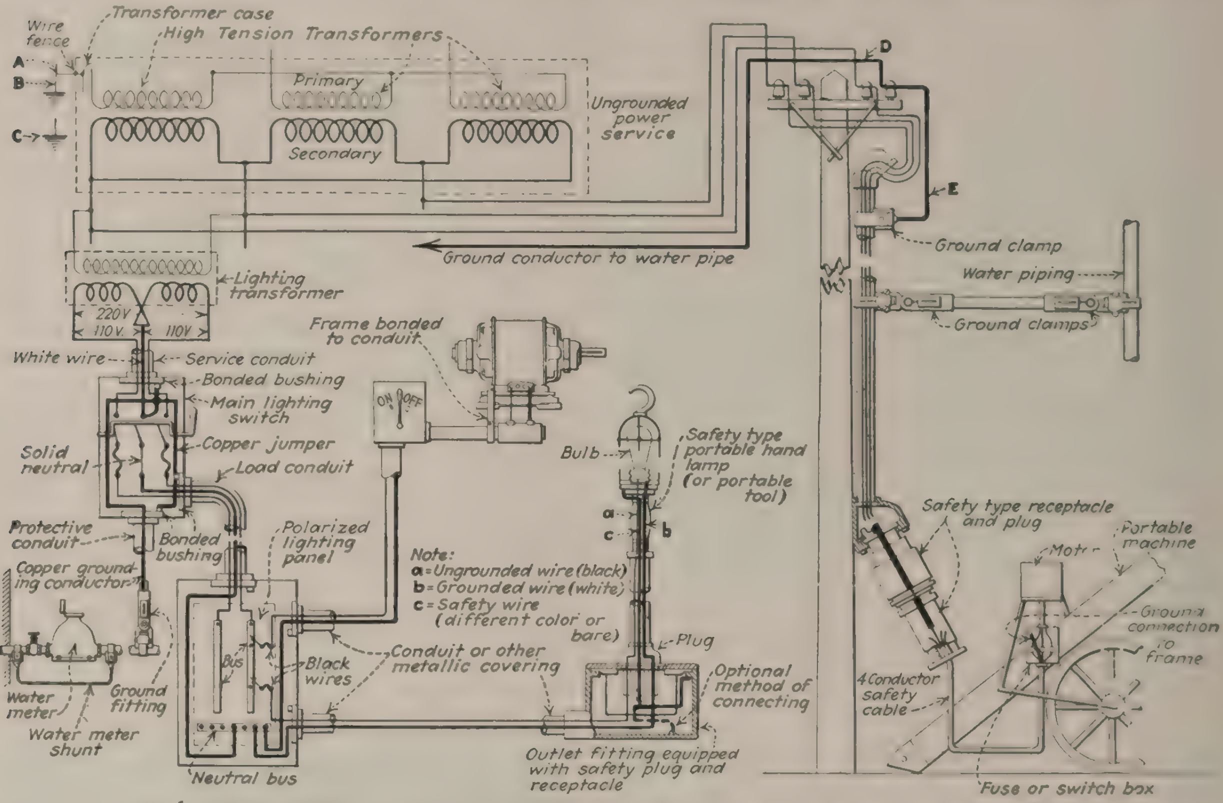


FIG. 1—TYPICAL INDUSTRIAL PLANT INSTALLATION IN ACCORDANCE WITH THE N.E.M.A. RECOMMENDATIONS (For high-tension grounding see N.E.L.A. bulletin No. 256-20)

A. Transformer cases, switchgear, framework and wire fence to be grounded.

B. To street side of water meter or to independent artificial ground of not more than 3 ohms and not smaller than No. 6 B. & S. wire.

C. Lightning arrester must have independent artificial ground, which should be 20 ft. from equipment ground and preferably not more than 10 ohms.

D. If necessary to reach permanent cold-water-piping system, run ground conductor to another building.

E. Can be run inside the conduit and attached to safety terminal of receptacle.

If the grounded-neutral conductor and one of the other conductors of the system are inadvertently reversed, there would be no tendency to blow the fuse, but one of the conductors would be at the same potential as the earth, while the white identified wire would be at a potential of 110 volts to earth and the third conductor would be at a potential of 220 volts to earth. This condition, however, would be quickly discovered, because there would now be 220 volts between the white conductor and one of the others where there should be only 110, and during the short time that the trouble existed the hazard would probably not be very serious because the frames of all the equipment would still be maintained at earth potential.

If for any reason whatever the grounded-circuit conductor becomes open-circuited at some point, the safety features of the system, in the way of equipment grounding, are in no way affected, no hazard is created, and the only effect is to injure or interrupt the service. If an open circuit occurs in a conductor of one of the safety circuits, the usefulness of the safety circuit would be destroyed, but there would be no additional hazard created.

All the above conditions have been predicated on the assumption that a water system is available for grounding. Where artificial grounds are employed, the conditions are as shown in Fig. 2 (a) and (b). The extent to which the secondary voltage would be raised above earth potential, with conditions such as exist in Fig. 2 (a), without an accidental ground, depends on a great many variable conditions, but it may be anything from nothing to practically the full voltage of the primary system. With an accidental ground, as at $G_3$, but without a high-tension cross-connection, both wires of the system will have a potential above earth inversely proportional to the resistance of the respective ground circuits. With the circuit shown the maximum potential is limited to 110 volts, but in the case of industrial establishments, where the 110-volt lighting and appliance circuits are often taken from auto-transformers connected across 440-volt and 550-volt power circuits, and from multi-wire systems, it is possible to obtain the full voltage of those systems between the supposedly grounded conductor and the earth.

These conditions at first sight look rather serious, as they are, but, if grounded as in (a) Fig. 2, these dangerous potentials are confined to the conductors, and it is not very probable that any one will come into contact with the conductors during the usually short period when such conditions exist. So long as there is no breakdown in the insulation of the secondary system the metallic inclosures will remain at earth potential when they are connected to a separate and independent ground electrode as $G_2$. If grounded as in (b) the inclosures will have the same potential as the grounded circuit wire, for which reason the code specifies individual electrodes where artificial grounds are used.

It has been suggested that the metallic inclosures might be grounded by connecting them to the grounded-circuit wire, as in Fig. 2 (c) and (d). With this system full potential is placed upon the equipment frames in case of an open circuit, as in (c), or in case of a reversal as in (d), and it also has all of the disadvantages of system (b). Such a grounding system nullifies those sections of the code which prohibit grounding the circuit wire inside the main switch and the interconnection of neutrals, both of which requirements are important safety measures embodied in the code.

The thing we are most seriously concerned with just now is the grounding of portable equipment in industrial establishments, and considerable pressure is being brought upon these establishments by industrial boards, labor commissions and others to this end. As a matter of fact, none of the old wiring and very little of the modern wiring in industrial establishments is polarized, but, on the other hand, the circuits are generally double-fused and switched, which condition, of course, presents a constant possibility of the grounded circuit wire becoming open-circuited.

A true safety circuit is a circuit which, if entirely removed, would still leave the system in an operative condition. Adequate protection requires systematic inspection of safety circuits of industrial-plant portables. It has been claimed by some that grounding to the circuit wire has an advantage because an open circuit in that wire automatically gives a warning that the device is unsafe to handle, having become inoperative. This reasoning, however, does not appear sound. Failure to operate generally means to the operator a fuse blown or current off, or something wrong with the tool, and no particular warning at all is registered. In any case he is not aware of the inoperative condition unless he is using or trying to use the tool, generally under his normal working conditions, and in that case he is subjected to the full hazard before he can possibly recognize any warning sign.

It would seem, therefore, that there are many serious objections to using the grounded-circuit wire for grounding metallic inclosures even assuming that its use can be restricted to those cases where water-piping systems of known low resistance are utilized for the earth electrode, which seems very doubtful.

The only difference between an artificial ground and a water system used for a ground is entirely one of resistance. It is quite possible to have an artificial ground of relatively low resistance, say less than 3 ohms, though usually expensive, and it is just as possible to have a high-resistance water ground, say higher than 25 ohms. The chances of a high-resistance water system ground are increasing constantly owing to the increase in the practice of using leadite joints in water mains. A recent report of the American Water Works Association indicates that joints of non-conducting material are being used in nearly 30 per cent of all new mains.

In considering costs it should be remembered that the grounded-circuit wire is not usually available at switch outlets, unless run there at extra cost. It is obvious that the cost of a knob-and-tube system, containing the necessary additional safety wire, cannot be a serious burden because there does not appear to be any great difference in cost between knob-and-tube wiring with such necessary protection and most of the other systems which inherently possess such protection. If the grounded conductor is run to all switch outlets, with the idea of using it for grounding, the difference will be still further reduced, if not entirely eliminated or reversed.

It might be well to point out that the objections which apply to the use of the grounded-circuit wire for grounding equipment apply with equal force to the suggestion which has been sometimes made that the neutral or grounded-circuit wire does not need to be insulated. It should be as fully insulated as any other conductor of an interior wiring system.

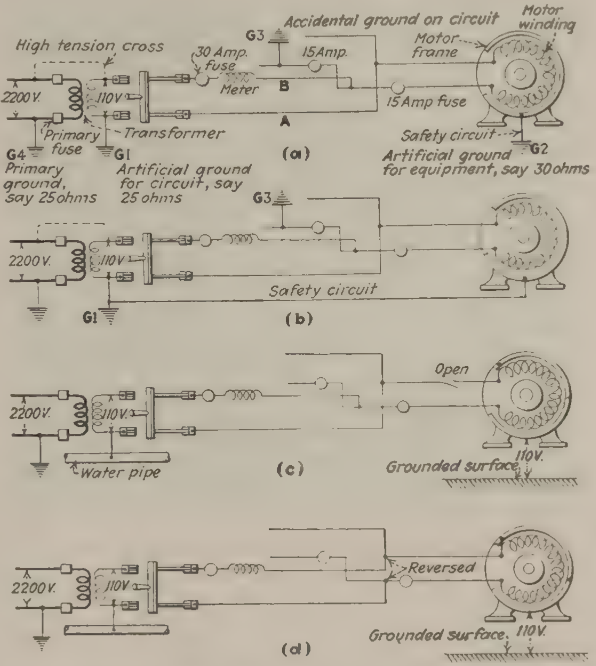

FIG. 2—GROUND CONDITIONS WHICH MAY OCCUR ON A SYSTEM

(a) Independent earth electrode for equipment ground.

(b) Where only a single electrode is used for grounding both the circuit and the equipment the apparatus would always have the same potential above ground as the conductor to which it is connected. A reversal or an open circuit of the grounded circuit wire would not result in any additional hazard.

(c) An open circuit of the grounded-circuit wire would place the frame at full potential to ground.

(d) A reversal will place the frame at full potential to ground. If the wiring has a metallic covering, a reversal will blow the fuse, but with these types of wiring there is nothing to be gained by this method of grounding.

## Movable Lighting Unit Employed in Display Windows

ONE of the special features of the Northwestern Electric Company's merchandising quarters in the new Public Service building in Portland, Ore., is the use of movable window-lighting units. For lighting the nine windows, Frink multi-lamp ten-section, double-banked window lighting troughs were used. A special canopy housing the two banks of lamps is arranged so that it may be raised and lowered to provide effective lighting for different kinds of displays.

The operating mechanism, which was specially designed for the installation, is all overhead, so that there are no obstructions in the window and is self-locking in any position. A detachable crank operated from the floor is used to raise and lower the unit. Its range of movement is such that lamps or color screens may be changed from the floor of the window.

EFFECTIVE ILLUMINATION INSURED FOR APPLIANCE DISPLAYS BY MOVABLE LIGHTING UNITS

Each window has four circuits for the main lighting and a special circuit for spotlights, in addition to which there are outlets for two floodlights. Each window has an individual distribution cabinet with a master switch controlling all circuits. With this arrangement it is possible to make a window lighting set-up with the individual circuit switches and control the whole with the master switch, thus insuring the same lighting effect for any period of time desired.

A portable flasher may be attached to any two adjacent lighting cabinets in case it is desired to have automatic color changes.

## Spectacular Signs Create Advertising Consciousness

IN SEEKING the location of the largest electric sign ELECTRICAL WORLD has been advised by Arthur Williams, vice-president of the New York Edison Company as follows: "I believe Atlantic City is entitled to this credit in the sign of the manufacturers of Chesterfield cigarettes. The size of the sign is stated to be 200 ft. x 60 ft. and is double-faced. It contains 26,000 lamps requiring approximately 500 kw. The estimated cost of the construction was, I understand, $325,000, and the annual cost of maintenance, including service, is said to exceed $100,000.

"The sign according to our reports was erected by R. C. Maxwell, of Trenton, New Jersey, and the changing effects are produced by the flasher of the James H. Betts Company.

"Visitors to Atlantic City are struck with the outstanding brilliancy and attractiveness of these signs along the ocean front. The electrical men of that city are certainly entitled to the gratitude of the entire electrical industry of the country. I imagine that no such lasting effect as to the value of electric signs in advertising is relatively possible anywhere else. In such a place as Atlantic City, men and women congregate from all over the country at a time when their minds are especially susceptible to receiving lasting impressions."

## Utility Ascertains Appeal to Make in Range Advertising

DESIRING to determine the effectiveness of electric range advertising carried on during the past few years and to secure definite information upon which to base its future advertising, the Northwestern Electric Company, of Portland, Ore., made a check of 204 nonrange users. Range salesmen called upon representative customers in their districts and after drawing the housewife into conversation concerning electric ranges, secured the following information by asking eight questions:

*Question 1.* What is your idea of the cost of an electric range?
61 per cent either did not know or thought that the cost was too high.
20 per cent answered "reasonable."
*Question 2.* What do you think of the monthly cost of electric cooking?
64 per cent answered "I don't know," "too high" or "expensive."
17 per cent answered "reasonable."
*Question 3.* Do you think the electric range of today is slow?
55 per cent answered "yes."
22 per cent answered "no."
15 per cent answered "I don't know."
*Question 4.* Do you know that the electric range is wonderfully clean and a big labor-saving device?
96 per cent answered "yes."
1.5 per cent answered "no."
*Question 5.* Do you know that the electric oven is equipped with a temperature control?
85 per cent answered "yes."
15 per cent answered "no."
*Question 6.* Do you know of the fine results obtained in baking with an electric oven?
66 per cent answered "yes."
31 per cent answered "no."
*Question 7.* Do you like to cook with gas?
43 per cent answered "no."
40 per cent answered "yes."
10 per cent answered "fairly well."
*Question 8.* What feature do you like best about gas?
70 per cent answered "It's fast."
15 per cent answered "everything about it."
10 per cent answered "nothing about it."

These replies clearly brought out the fact that six years of electric range advertising concentrated on temperature control and cleanliness had proved quite effective and that three important features—speed, cost of operation and price—which had been kept in the background in the advertising, should now be made the major theme of advertising and sales promotion literature.

# Federal Control Is Issue

## in Walsh Resolution*

Companies will assist. They have nothing to hide, but rather welcome complete investigation to clear the air and reassure public that situation is sound

By M. S. Sloan
*President Brooklyn Edison Company*

WHATEVER develops during the present session of Congress will be of importance not alone to utilities, but to every individual and institutional investor in their securities and to the general public as utility customers and taxpayers.

There are two elements in the situation at Washington. One is the proposal for a Senatorial investigation of gas and electric utilities and their financing. The second is, in essence, an effort to put the federal government into the electric power business. These elements are not as unconnected as they may seem at first glance. In fact, the proposal for an investigation is based in large part on an assumption that a power trust, so called, exists, and that government competition is necessary for the protection of the public.

On Dec. 17 Senator Walsh of Montana introduced his resolution of last year, somewhat amended, calling for appointment of a committee of five Senators to make an inquiry into gas and electric utilities, holding companies and engineering and management companies. The resolution, if finally adopted as presented, would authorize an inquiry into the financing of companies, their relations with holding, investment and management companies—opening the subject of the so-called power trust—the extent to which they may have used money or publicity to influence public opinion regarding municipal ownership of utilities, and whether they have endeavored to influence or control elections.

We are not opposed to an investigation. We are not afraid of an investigation. We are confident that an investigation which is fair and square, seeking a complete and accurate picture of the industry, endeavoring to deal seriously with a very complicated, technical subject, will not harm the utilities, but may, in the long run, be beneficial by setting at rest unfounded and misguided statements which are going the rounds. It ought to dispose finally of the notion that there is a vicious power trust. It ought to convince official critics of utilities that their rates are not extortionate, but are, instead, reasonable and being made lower whenever possible because it is good business for utilities and public alike to have rates as low as they can be and still allow the companies to earn adequate compensation.

It ought to prove that mergers of utilities are a logical and inevitable development of the business, beneficial alike to customers and companies. It ought to prove that holding companies, so called, have been the only agency by which many sections of the country could get better utility service and lower rates. Through these companies, utility units, not strong individually, have been grouped so that adequate financing was possible, economical operation and better service became possible, and frequently lower rates have been put into effect. As greater sales of service have resulted, the local utilities have benefited and the holding companies have been recompensed for their effort and investment.

If an investigation is held, the utilities can be counted on to co-operate. They have nothing to hide; their affairs are not secret. They are operated under the supervision and regulation of public officials; they make sworn reports in great detail to these officials; they keep books according to commission requirements. They have to obtain official authorization for capital increases, rate changes, mergers.

We in the utility business believe we are doing a good job—a job of real value to all elements of the public—and if an investigation is necessary to convince skeptics, we do not intend to fight it even if we cannot see why it should be considered necessary. There's another point I want to emphasize. The utility industry is no more nor less than the individuals who compose it. If there are weak brethren in it, as there may possibly be—if somewhere along the line there have been improper acts or policies by individuals or individual companies—we say let them be shown and known as such. We do not want to see them charged against the industry. The industry, I know, would not defend them or excuse them. It would, on the contrary, do whatever could be done to help prevent anything of the sort in future.

### Opposed to Government in Business

The second element in the situation at Washington is the issue of government in business. Muscle Shoals will be discussed again. Shall the plant be sold? Shall government operate it to make nitrates, or to make power? Shall government lease it to the group of Southern power companies, or to somebody who will produce fertilizer? Because of a new process of making nitrates, government opinion seems to be coming around to the view that it would be uneconomic to devote the plant to that purpose. So far as I can see, that is the one new phase which makes the situation different from what it has been in previous years.

Then we have the Swing-Johnson Boulder Dam bills. This project has been before Congress for a number of years; its advocates hope to get it adopted this session.

---

**Address before N.E.L.A. committee on relations with financial institutions, Eastern Geographic Division.*

The project is put forward, first, as a flood control measure to protect the Imperial Valley; second, as an irrigation measure—it is said it would double the area of irrigated land in the valley; third, as a means of supplying domestic water to Los Angeles and, perhaps, other communities in southern California. Its advocates say the entire cost could be met by proceeds of the sale of the power which would be developed.

The electrical industry has gone on record in opposition to these bills as they stand. We are not opposed to flood control by the government in this case, if that is the only agency which can bring about relief—and apparently the seven states in the Colorado River Basin find it impossible to get together and stay together on all the points involved in this matter. We are not opposed to irrigation of desert lands, where it is proved to be a desirable and economic undertaking. We are absolutely opposed to putting the federal government into the electrical business to pay for flood control, or for irrigation, or for a domestic water supply for any community or group of communities. If flood control and irrigation are necessary and desirable, the construction costs should be paid from taxes and the expenditure considered legitimate. If Los Angeles and other communities need more water, why should they not procure it at their own expense as other cities have to?

### Doubtful if Boulder Dam Power Will Pay Interest on Investment

We are not opposed to a complete, scientific development of the Colorado River which shall utilize its waters for all purposes. There should be a revenue for government from the power developed; but it is not necessary to put the government into the power business to obtain that revenue. It could be handled under the provisions of the federal water power act with entire justice to the government and the electrical industry, we believe. In fact, we believe the government would be far surer of a satisfactory revenue under those conditions than if the pending legislation were passed and the government went into business at Boulder Dam.

This project contemplates a feat of engineering such as has never yet been attempted. The estimate of $125,000,000 cost, under the circumstances, is merely a guess. Other engineers have guessed $200,000,000—the cost might easily run a great deal higher than that. The success of the whole enterprise, from the point of view of power, is dependent on the cost. Boulder Dam power must be sold in Los Angeles and that vicinity in competition with any other power supply there. It must be transmitted 250 miles to its market. That market is already fully supplied, and will have to continue to be supplied during the ten years which it is estimated will elapse before Boulder Dam power can be delivered. Electric energy generated by steam is now being produced in Los Angeles at a lower cost than that estimated for Boulder Dam power delivered there and ten years hence power from stream will, without much doubt, be cheaper than it is now, owing to constant improvements in steam generation of electricity. It has been figured—on a basis of $200,000,000 cost—that Boulder Dam power, if and when it is deliverable, cannot be sold for a price that will pay the interest charges on the development, let alone operating charges and amortization of principal.

Power developed and sold by the federal government, therefore, cannot be expected to take care of the costs of this project on any honest system of bookkeeping. But power should not be expected to. The construction costs would be attributable to three purposes: flood prevention, irrigation, power development. The plain, straightforward, business-like thing to do, it seems to me, would be to allocate them in that fashion. Let the power phase of the project be handled in accordance with the federal power act. Let the power house be built, in accordance with the terms of that act, by the highest bidder for the privilege. Power then would not be saddled with the costs of flood prevention and irrigation. Boulder Dam power, under such conditions, might be carried to Los Angeles and sold in the market along with the low-cost steam power generated there. The government would be relieved of a considerable initial expenditure, and it would be assured a revenue. That seems to me reasonable, just and equitable for all interested in this situation. It would not depart from the present policy of the government as to water power development, and it would not put the government into the power business.

### Separate Project for Flood Prevention

There is another point to be considered in respect to Boulder Dam. Eminent engineers, some of them in government service, have carefully considered another site on the Colorado River for a dam for flood prevention. A dam built at Topok, further down the river, for flood prevention only, would cost only $15,000,000, and it is said would offer more real protection to Imperial Valley against floods than Boulder Dam. A word on this subject of floods. A great many people undoubtedly vision something like the Mississippi disaster, with much loss of life. There would be property damage, but there is no likelihood of loss of life.

Cut out the power phase of this project and what is there left? Flood control, which could unquestionably be accomplished by a dam elsewhere, and perhaps better and at less expense. As to the wisdom of irrigation, both practical and economic, there is much question. As to the domestic water supply, there is great division of opinion whether or not Los Angeles has not sufficient and satisfactory sources of supply entirely outside the Colorado River, and whether or not that would be a satisfactory supply under any condition because of the silt and mineral salts the water carries.

The nub of this problem, therefore, is the government development of power at Boulder Dam. I doubt very much whether the agitation for this project could have been sustained over a number of years—whether it could be kept up now—if the idea had not been put out that it "would not cost anything." Yet that phase of the matter is more dubious, more questionable, than any of the other phases. And if it falls, the whole scheme falls.

Boulder Dam is highly important because what is done in this instance will serve as a precedent for others. A similar scheme is being agitated for the Columbia River. It is sought to apply the same idea to developments on the Tennessee. It has been suggested that power could be made to pay a large part, perhaps all, of the costs of flood control on the Mississippi. What we must consider, therefore, is not this one item—government in the power business on the Colorado—but government in business in many parts of the country.

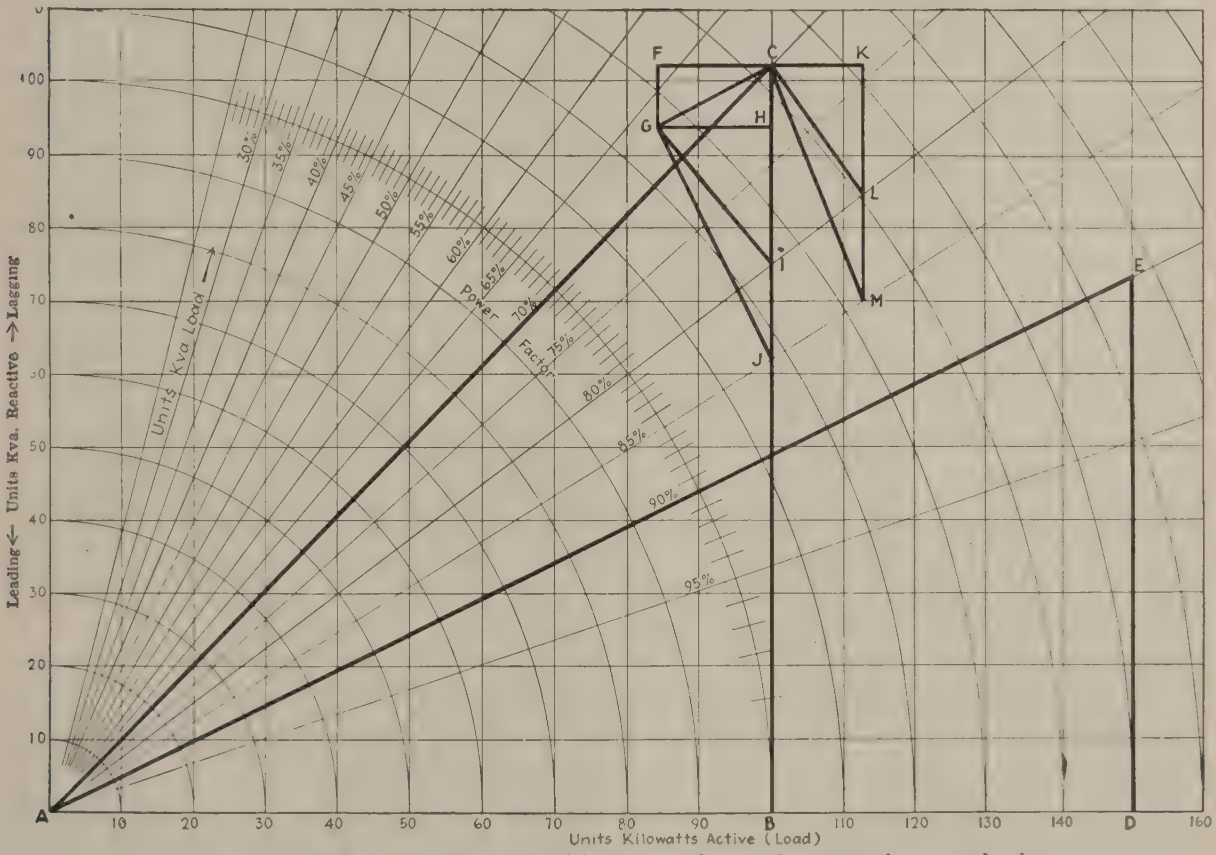
Is it for the best interests of this country to have the government in the power business? President Coolidge said recently that once government entered business it could not stop short of absolute monopoly. Is that what we want in this country, in the electrical business or any other?

## Determining Customer Costs

A STUDY of the cost of serving residential and commercial customers by the Cambridge (Mass.) Electric Light Company recently resulted in a minimum of $11.23 per year as the direct customer cost, including certain operating expenses and overhead. The average number of residential customers in 1926 was 19,329 and commercial customers averaged 3,467. The operating expenses of the company assignable to the former group totaled $154,077 and to the latter $27,619, or $7.97 average per customer. Property values (based on reproduction cost, less depreciation) directly assignable to these customers totaled $854,287 for a maximum number of 20,968 residential customers, and $146,100 for a maximum of 3,589 commercial customers during the year. The average property value prorated per customer was $40.74, and charges on this sum at 8 per cent per annum totaled $3.26, giving a total of $11.23, or $2.23 more than the 75 cents per month service charge proposed by the company in connection with the adjudication of its rates by the Massachusetts Department of Public Utilities. The foregoing analysis included no allowance for operating expenses or property values assignable to either demand, energy or revenue groups of costs.

## Corrective Power Factor Plans Readily Compared

RAPID computation of problems encountered in efforts to secure better power factor conditions at the customer's plant is secured through the use of the accompanying chart by the power representatives of Public Service Electric & Gas Company (New Jersey). This device offers a means of ready reckoning for the comparative merits of achieving corrective kilovolt-amperage by the use of static condensers, by replacement of an induction motor by synchronous equipment and by addition of synchronous motors to existing loads.



*Power factor chart offers rapid comparison of corrective methods*

**Example:** Customer has 1,000-kw. load at 70 per cent power factor. Customer's circuit conditions are as follows, referring to chart: $AB = 1{,}000$-kw. active load. $BC = 1{,}010$-kva. reactive and $AC = 1{,}420$-kva. load (scale 10 to 1). To correct this customer's load to 80 per cent power factor, using three different methods:

*First.*—By means of a static condenser. Condenser should have 265-kva. capacity, represented by $CI$ (nearest commercial size static condenser should be selected). For correction to 85 per cent power factor static condenser would have $CJ$, or 390 kva.

*Second.*—By means of a synchronous condenser to replace an existing induction motor which is in constant use and raise the power factor to 80 per cent. Assume customer has a 225-hp. induction motor operating constantly at full load and 90 per cent power factor. Kilowatt input to motor = 225 × 0.746 × 0.90 = 150. Triangle $ADE$ represents to full scale the conditions on this induction motor and shows reactive kilovolt-amperage of $DE$, or 72 kva. From point $C$ lay off triangle $CFG$ (scale 10 to 1), which represents the 225-hp. motor taken off the customer's circuit ($CF$ representing 150-kw. load taken away and $FG$ representing 72-kva. reactive). The synchronous motor to be added to customer's circuit will have mechanical load of 150 kw., or $GH$, and a leading reactive kilovolt-amperage of $HI$ (note this is projected downward to the 80 per cent line, as it is leading). The kilovolt-amperage of the synchronous motor will, therefore, be $GI$, or 250 kva. In most instances it would be best to figure on correcting power factor to 85 per cent, in which case leading reactive kilovolt-amperage would be $HJ$ and kilovolt-amperage will be $CJ$, or 350 kva.

*Third.*—By means of a synchronous condenser to carry additional mechanical load (motor to be in constant use) and raise the power factor to 80 per cent. Assume customer puts on his circuit a synchronous motor to drive an air compressor which will run constantly, the mechanical load on synchronous motor to be 175 hp., or 130 kw. From point $C$ lay off $CK = 130$ kw. additional load on customer's circuit, then $KL$, or 165 kva., represents the leading reactive necessary in the synchronous motor to bring power factor of customer's circuit up to 80 per cent. The capacity of the synchronous motor is represented by $CL$, which equals 210 kva. In order to provide for future requirements of customer's circuit it would be best to figure on correcting his circuit to 85 per cent power factor, in which case the capacity of the synchronous motor is represented by $CM$, which equals 330 kva.

**Note:** Efficiencies of induction motors and synchronous condensers not taken into account in above calculation.

## Borings Reclaimed at $20 per Ton With Electricity

THE melting of malleable and gray iron in electric furnaces is a comparatively recent development. A new installation of an arc-type electric furnace for this work has been completed in Milwaukee, on which the operating costs were quoted by O. O. Wagley of the Milwaukee Electric Railway & Light Company at the commercial section meeting of the Wisconsin Utilities Association.

In this furnace gray iron borings from the manufacturer's machine shop are utilized. This type of scrap has very small market value and conversion of this material into high-grade castings has great possibilities. The following summary shows the operating costs of this trial installation for melting 49.1 tons of gray iron borings:

| | |
|---|---|
| 1. Power costs—580 kw.-hr. per ton at 1 cent per kw.-hr. . | $5.80 |
| 2. Lining costs—49.1 tons borings melted with $64 lining plus $7.50 patching material, 304 heats averaging 323 lb. each | 1.46 |
| 3. Electrode cost, 9.03 lb. per ton at 25c. per lb. | 2.34 |
| 4. Labor cost, one man at 75c. per hour, producing 1,000 lb. of metal. Cost per ton | 1.50 |
| 5. Boring cost, market price per net ton, f.o.b. Milwaukee | 8.90 |
| 6. Melting loss, 4 per cent of $8.90 | .35 |
| Total melting cost per net ton | $20.35 |

The advantages of these operating costs can readily be appreciated when it is considered that a melting cost of $28 is considered good practice with ordinary cupola operation.

## Carbonizing Furnaces Earn Cost in One Year

IN THE manufacture of automobiles, tractors, and many other types of equipment where there is much carbonizing or case hardening to be done, electric furnaces have been found very well suited for this work, and, from the central station standpoint, this is an important application of electric heating.

One large tractor manufacturer in Milwaukee installed two pusher-type furnaces at a cost of $85,000. While the cost of electric heat about equals the cost of oil fuel formerly used, there are great savings made in labor, in building space, and in quality of product. Instead of twelve employees per shift, five now do the work. The floor space, formerly crowded when carbonizing the parts for 40 tractors per day with oil-fired furnaces, is now adequate for a production of parts for 120 tractors a day. Instead of a large percentage of rejects, the uniformity of results from the electric furnaces is such that there are almost no rejects, and the cost of inspection is reduced. The electric furnaces paid for themselves in one year's operation. The operating economy of the recuperative type of furnace such as that installed is shown in the accompanying tabulation.

OPERATING ECONOMY OF ELECTRIC RECUPERATIVE CARBONIZING FURNACE

| Chamber No. | Gross Weight per Hour Lbs. | Depth of Case, Inches | Kw.-Hr. per Ton |
|---|---|---|---|
| 1 | 945 | $\frac{1}{16}$ | 175 |
| 2 | 946 | $\frac{1}{16}$ | 165 |
| 3 | 760 | $\frac{1}{16}$ | 171 |
| 4 | 728 | $\frac{1}{16}$ | 174 |
| 5 | 720 | $\frac{1}{16}$ | 180 |

These data were taken on five furnaces operating in one plant and cover a regular production period of one week. It is interesting to note that the daily power consumption of the five furnaces averages 8,600 kw.-hr., resulting in a revenue of $86 per day. These furnaces are operated seven days a week, including Saturdays and Sundays, giving a load factor of approximately 90 per cent, with an operating power factor of about 95 per cent. The process results, being greatly improved, add to the factor of cost savings.

# Letters from Our Readers

### *Times Have Changed*

*To the Editor of the* ELECTRICAL WORLD:

"Less than ten years ago we installed electricity upon our farm. My husband was instrumental in getting a line extended in our direction. At that time we had to build the main line ourselves (by 'we' I mean the few neighbors who combined to get this done), wire our own buildings and put up our own transformers. Then, on making a gift of the line to the nearby electric company, it supplied us with juice at a very high rate. But times have changed. Since the small electric companies have become absorbed by large corporations they are able to do far more at extending lines and keeping them in repair than it was possible for local companies to do because of their lack of capital."

The above paragraph is quoted from an article on electricity in the farm home written by a farmer's wife and published in *Successful Farming* for February, 1928. The article is significant because it indicates that the farmer receives, and knows that he receives, a direct economic benefit from large aggregations of capital in the electricity supply industry. CONTRIBUTOR.

Chicago, Ill.

### *The Three Prestons*

*To the Editor of the* ELECTRICAL WORLD:

Stop for a moment counting up how many Smiths, Browns and Johnsons there are in the United States and consider the uniqueness of the fact that there are three officers of the Association of Edison Illuminating Companies who answer to the name of Preston. To begin with there is H. Preston Liversidge, who is the president. Mr. Liversidge is vice-president and general manager of the Philadelphia Electric Company. Next is Preston S. Arkwright, president of the Georgia Power Company, Atlanta, who is vice-president of the association. And then there is the executive secretary, who is Preston S. Millar of New York City.

As Mr. Arkwright said in commenting upon the similarity of names, it would not be quite so noticeable if the name was "Bob," or "John," or "Percy," or "Algernon," but "Preston" is a little out of the ordinary run of names. "At least there should be co-operation and harmony among the three Prestons," Mr. Arkwright commented. BYSTANDER.

Atlanta, Ga.

## *Hydro-Electric Development and Steam Equipment*

*Coal Measuring vs. Weighing for Power Houses.*—J. E. Lea.—The author has proceeded upon the assumption that the measurement or weighing of coal is seldom accurately determined. Surface moisture is judged to be the cause of the major discrepancies and it is suggested that an hydraulic principle of measurement which will be continuous instead of intermittent, so that the rate of flow can be determined and so that large quantities may be dealt with in a simple, expeditious and accurate maner, is desirable. The hydraulic principle is based upon the postulate that small coal can be regarded as far as measurement is concerned, as a liquid or at least to such an extent that the principles of hydraulics can be applied to the determination of its volume and weight.—*The Electrician (England)*, Dec. 30, 1927.

*Pulverized Fuel for Power Stations.*—G. H. Lake.—Summarized results of burner-operating tests are given for the Derby generating station in England. Several innovations in steam-superheating and coal-preparing practices have been introduced in the design of this station and, as a result, unusually high economies have been obtained. The author has included detailed costs of coal consumed and of maintenance factors for the various items entering into the pulverized fuel installation. The reduction of these charges to the basis of cost per ton of fuel consumed offers an interesting contribution.—*The Electrician (England)*, Dec. 23, 1927.

## *Transmission, Substations and Distribution*

*Automatic and Remotely Controlled Substations.*—Data regarding automatic substations and those remotely controlled through supervisory direction have been compiled for a number of stations, and information regarding capacity, date of placing in service, the manufacturer of the equipment, the automatic features, the supervision, frequency of inspection, and details of the control circuit, are included for substantially all the stations listed in the present discussion. Recent developments in equipment for this purpose are covered in statements by two large manufacturers and a producer of special equipment. Improvements in and additions to the devices included in such stations are dealt with. — *Serial Report, Electrical Apparatus Committee, National Electric Light Association*, November, 1927.

*132,000-Volt, Single-Conductor, Lead-Covered Cable.*—P. Torchio.—The development of the economic and commercial demand for oil filled 132,000-volt cable is outlined. It is stated that this type of cable permits direct interconnection with high-voltage overhead lines and it is felt that the satisfactory operation of the two lines which have been placed in service this year offer an indication that 220,000-volt cable can be constructed without material changes in design. Particular reference is made to the effect upon the dielectric of occluded gas and to the method of eliminating trouble from this cause in the oil-filled type. The manufacture, inspection and testing of the cable and equipment is also reviewed, and, as the result of tests, it is indicated that the electrical constants of the cable are substantially unchanged by normal temperature cycles. Inspection, indication of oil leaks, and cable and joint repairs as developed in the New York and Chicago installations and the replacement of a length in one section which developed a leak in the sheath, are also covered. — *Report, American Institute of Electrical Engineers*, November, 1927.

## *Generation, Control, Switching and Protection*

*Fire Protection of Generators.*—J. Brandl.—The ease of storing and inert character toward electric arcs makes carbon-dioxide the most desirable quenching gas for electric fires in generators. Steel cylinders, containing the liquified gas, can be located near each protected object, or a centralized cylinder battery can be provided. Neither a pressure gage nor a gage showing the liquid are reliable indicators of the amount of $CO_2$ left in the cylinders. The only dependable method is to install the cylinder battery permanently upon a small platform scale and to balance the load. Special precautions are necessary to avoid freezing and the forming of snow when the gas is released. Dampers or movable louvers are advocated to restrict the escape of the gas, unless the machine is of the closed circulation type.—*Elektrotechnische Zeitschrift*, Dec. 1, 1927.

## *Units, Measurements and Instruments*

*A Two-Range, Vacuum Tube Voltmeter.*—C. M. Jansky, Jr. and C. B. Feldman.—The design, uses and limitations of a new circuit employing the three-element vacuum tube as a voltmeter are discussed. The two overlapping ranges of voltage, together with a single operating battery are the unusual features. The effect of wave-form and the elimination of that effect are treated. It is stated that frequency has but little effect on the operation and this effect can be eliminated by use of a by-passing condenser; the imput impedance is high, of the order of several megohms, and the power factor is low; differences in wave-form are exaggerated but not, for commercial wave-forms, objectionably so; the sensitivity is higher than that of most other communication-frequency measuring instruments; the range is inherently low, covering probably a band of voltages from a tenth or a few tenths of a volt to about ten volts. The stability of calibration over the entire life of the tube is questionable. Experiment showed, however, that, in general, the calibration could be expected to remain constant for periods of operation of more than 40 hours.—*Report, American Institute of Electrical Engineers*, November, 1927.

*Standardization of Terminal Chambers for Single-Phase and Polyphase Watt-Hour Meters.*—The standardization agreed to by utilities and manufacturers is clearly presented. This standardization, it is anticipated, will result in considerable saving, as the installation of the meters will be simplified, and as the number, sizes and types of adapters will be greatly reduced. The adapters were relatively costly, and now that a simple standard arrangement can be utilized, the cost should be decreased. Aside from this saving, the details in connection with the installation of watt-hour meters are simplified, so that any meter available in utility storerooms can be installed on any equipment provided with a standard end wall.—*Serial Report of the Meter Committee, National Electric Light Association*, 1927.

## *Heat Applications and Material Handling*

*The Davies Magnetic Separator for Ores.* — An electro-magnetic apparatus suitable for the separation and concentration of any magnetic material, whether highly or weakly magnetic, has been devised. The design of the equipment utilizes the lines of force emanating from pole pieces, and, by rendering certain bands magnetic, it is possible to remove materials of high magnetic permeability from the mineral under treatment before it enters the magnetic field proper.—*Engineering (England)* Dec. 9, 1927.

*Rectifiers for Dock Cranes.*—W. Waltz.—The article gives a description of dock installations where the power for numerous loading cranes was formerly supplied by a motor-generator substation. The demand of such installations varies almost continuously between low and double normal load in a succession of short peaks, so that the motor-generators formerly used were equipped with heavy flywheels. The average over-all efficiency and the power factor of the driving motor were both low. Conditions were materially improved by the substitution of mercury-arc rectifiers in place of the motor-generator sets. Efficiency and power factor of these rectifiers are almost constant from one-quarter load up. Measurements, continued for a number of days, indicated an average efficiency of 67.8 per cent and 92.6 per cent respectively before and after the remodeling of one of these two installations.—*Brown, Boveri Mitteilungen*, December, 1927.

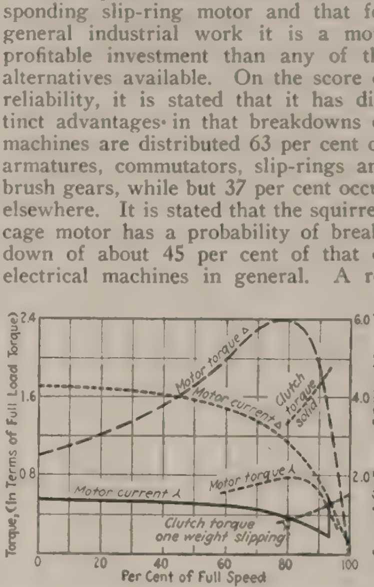
## *Electrophysics, Electrochemistry and Batteries*

*Peculiar Behavior of Transformer Oil.* — A. Schwaiger. — The dielectric strength of oil can be greatly increased by thoroughly removing all traces of its water component. It is stated that if puncture tests are made on three grades of oil with (1) plate electrodes, (2) sphere electrodes and (3) sharp edge electrodes and the results are plotted into a logarithmic coordinate system it will be found that the plates give a straight line, the spheres give an upward bent curve, while the sharp electrodes show a decidedly downward bent line. In other words, for spheres under oil the strength of the oil should be raised as high as possible. For sharp electrodes an increase beyond a certain limit is almost useless. It seems, therefore, that the content of water is useful with sharp electrodes and detrimental with spheres. The author explains this by the fact that the water particles are attracted toward the electrodes and thus tend to make sharp edges more round, while they upset the sphericity of balls, tending to concentrate the field. Since more or less sharp edges are much more frequently found on apparatus than spheres or plates, dielectric strength data of oil based on sphere electrodes are misleading as to what could be expected from drier oil. *Elektrotechnische Zeitschrift*, Nov. 10, 1927.

*Insulating Materials for Electric Machines.* — L. Fleischmann. — Solid insulating materials, such as are in extensive use on electric machines, transformers and apparatus, require a much more careful selection than metallic parts, as their electrical and mechanical properties are not constant, but are affected by a number of circumstances, such as heat, humidity, chemical changes, etc. Furthermore, these changes are not proportional to the variations of the influencing factors, nor can the laws of change be expressed in an exacting mathematical manner. In most cases, experimental work with tabulated or graphically represented results is the only basis for proper selection. A further aggravating factor is introduced by the possibility of the pressure of non-homogeneous material or air-filled voids. A test is described to measure the surface creep over built-up mica insulation to show how distance and thickness affect the flash-over. A characteristic compound puncture curve is given to illustrate how temperature affects the dielectric stress. — *Elektrotechnische Zeitschrift*, Nov. 3, 1927.

## *Motors and Control*

*Squirrel-Cage Induction Motors.* — D. B. Hoseason.—A general discussion of the characteristics and comparative value of squirrel-cage induction motors, with particular references to means of improving their starting performance. It is stated that the squirrel-cage motor has usually both a higher efficiency and a higher power factor than the corresponding slip-ring motor and that for general industrial work it is a more profitable investment than any of the alternatives available. On the score of reliability, it is stated that it has distinct advantages in that breakdowns of machines are distributed 63 per cent on armatures, commutators, slip-rings and brush gears, while but 37 per cent occur elsewhere. It is stated that the squirrel-cage motor has a probability of breakdown of about 45 per cent of that of electrical machines in general. A recently devised centrifugal clutch, consisting of plates pressed together by weights normally held out of operation by springs, offers greatly improved starting performance, and the accompanying curve indicates the characteristics obtained through the equipment of a motor with this device.—*Electrical Review (England)*, Dec. 23, 1927.



MECHANICAL CLUTCH IMPROVES CHARACTERISTICS OF SQUIRREL-CAGE MOTOR

*Capacitors.*—M. C. Lowe.—The fundamental considerations involved in the use of capacitors and the general character of the problems involved in their application to utility and industrial work are mentioned. The use of capacitors as lightning arrestors as well as for power-factor correction is indicated as being a promising development toward which very little has been done. The advantages of capacitors over other devices for the rectification of power-factor are mentioned, as, the elimination of attendants; minimized operating losses; reduced line losses; flexibility of size with capacity requirements; and full agreement with underwriters specifications without special provision. — *Electrical News (Canada)*, Jan. 1, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*The Vacuum Tube Rectifier.*—John H. Kuhlmann and James P. Barton. —An investigation undertaken by means of oscillographic and vacuum tube voltmeter methods has been applied to the B-voltage supply for radio receivers. The object of the determination was to observe possible opportunities for improvement in the design of such rectifiers as well as the most satisfactory type of filter circuits and the appropriate values of inductance and capacitance which will give a direct current output delivered with the least practicable voltage drop and having no fluctuation of sufficient magnitude to interfere with the proper operation of the set. The vacuum-tube peak voltmeter used to detect very small fluctuations is described. The author concludes that the voltage drop in the filter circuit should not be high and that the series inductance should not be larger than required to produce a current without ripples.—*Journal American Institute of Electrical Engineers*, January, 1928.

## *Miscellaneous*

*The Effect of Running In on Journal Bearing Performance.*—F. A. McKee. —A feature recognized by the operators of machines containing journal bearings is that a certain amount of "limbering up" or "running in" is necessary before this type of bearing behaves in a normal manner. The author has described an investigation conducted by the Bureau of Standards, the object of which was to evaluate this effect of running in upon the performance of babbitted, full-journal bearings. A specially designed journal-bearing friction machine provided a method of measuring the frictional loss when operating under different conditions of load, speed of the journal and viscosity of the lubricant. By correlating these factors in a suitable manner, a measure of the effect of progressive amounts of running in on bearing performance was obtained. The results indicate that running in causes a marked reduction in the frictional loss of a bearing under very severe operating conditions. The effect upon the factor of safety is pointed out, and the possibility of increasing the efficiency of high-speed journal bearings is indicated by a hypothetical example of a steam-turbine bearing.—*Mechanical Engineering*, December, 1927.

*The Design of Condenser Bushings.* —A quick method of designing condenser bushings is described. The procedure has been developed for uniform axial and radial potential gradients, assuming infinitely thin layers and also finite thicknesses; the design for uniform axial stress with the use of layers of unequal thickness, has also been worked out. It is stated that the rapidity with which the tabulation may be made and the idea of the nature of the result obtainable is of considerable importance. A number of influences, including length of mounting, diameter of the conductor, and tangential and radial stresses, have been considered and investigated in order to obtain the best arrangement and dimensions. Various formulas and characteristic curves aid in the development of usable information.—*The Electrical Review (England)*, Dec. 9, 1927.

# News of the Industry

## Amended Walsh Resolution Approved

### Language Altered in Effort to Confine Investigation to Interstate and Federal Matters—Move to Substitute Trade Commission as Agency for Inquiry Lost on Tie Vote

By Paul Wooton

*Washington Correspondent of* Electrical World

An investigation of the electric and gas public utilities doing an interstate business was on Feb. 1 recommended by the interstate commerce committee of the Senate as a result of its hearings on the Walsh resolution. The committee recommends that the investigation be conducted by a special committee of the Senate. An effort to have the investigation made by the Federal Trade Commission was lost on a tie vote—nine to nine. Before reporting out the resolution, the committee amended the proposal of Senator Walsh so as to limit the investigation to public utility corporations doing an interstate business and to corporations holding the stocks of two or more public utility corporations operating in different states.

The resolution thus amended was not satisfactory to Senator Wheeler of Montana, Senator Howell of Nebraska and Senator Black of Alabama. They announced their intention of submitting a minority report, which, it is understood, will ask an inquiry into all election campaign contributions of power companies, as proposed in the original resolution. The committee left in the Walsh resolution the provision to investigate expenditures looking to the influencing of public opinion against public ownership. The investigation as to expenditures intended to influence elections was limited so as to refer only to the election of federal officials.

While the amended resolution is unsatisfactory to some of the advocates of the Walsh resolution, its scope has not, it is believed, been restricted to the point where it will meet the approval of those members of the Senate who see in it an unwarranted intrusion into the jurisdiction of the several states. For this reason difficulty may be experienced in bringing about its adoption.

### Ainey on Joint State Regulation

William D. B. Ainey, chairman of the Public Service Commission of Pennsylvania, told the committee at its last session, on Thursday, Jan. 26, that in his opinion Senator Walsh's proposed modification extended the resolution rather than restricted it. Senator Walsh asked if he would like to have it withdrawn. Mr. Ainey said it would be a fine thing if he would withdraw it, and "in so far as the red thread of interference with state regulation and authority is concerned, I would be delighted if you would go a step further and withdraw the whole resolution." In discussing the ability of the states to handle regulatory questions when the power is generated in one state and used in another, Mr. Ainey declared that "in working out the Conowingo project co-operatively between the Maryland commission and the Pennsylvania commission we solved every single interstate regulatory matter that could be involved in that great project."

### Ransom Makes Legal Argument

Final argument on behalf of the Joint Committee of the National Utility Associations was made by William L. Ransom of New York. He said that all the committee had to decide was whether a prima facie case had been made and, if it had, what were the reasonable principles of limitations which should be written into the resolution. He pointed out that Senator Walsh had conceded that power to investigate is limited by the power to legislate. "To talk about investigating an industry," said Mr. Ransom, "is a round phase, but the thing to keep in mind when you investigate an industry, if you call it that, is that what you really investigate is companies, local companies; that what you really bring here is Tom Brown and Ralph Jones and books and papers of the companies operating in the states of the Union. And what you adopt, when you talk about investigating an industry, is that, at the election of your committee, the officers, accounts and vouchers of 3,500 companies in every or any part of this country may be brought by subpœna of any senator for overhauling.

"The resolution as it stands," Mr. Ransom continued, "means the banks in any town. It means the local companies and concerns that do construction service in any county or in any town, the local citizens engaged in local business in any city, village or section of the United States—not only capitalization of utilities, not only capitalization of holding companies, but the capitalization and the increase in capital assets and capital liabilities of all these non-utility corporations."

In his analysis of the matter Mr. Ransom found that only four grounds of possible jurisdiction had been mentioned. They were the transmission of electrical energy and gas across state borders, the interstate sale and transportation of utility securities, the restraint of trade and the exclusion of fraudulent securities from the mails.

Mr. Ransom admitted that Congress had the power to legislate and, as a consequence, to investigate interstate transmission, but maintained that the investigation should not be by a special committee of Congress. He pointed out that the Supreme Court had held that the regulatory power is not limited by the price paid for power at wholesale or the cost at wholesale, but that the courts and the state commissions may inquire what is a reasonable price under all circumstances. In connection with Senator Walsh's charge that a part of the capitalization of the utilities "is pure water or thin air," Mr. Ransom brought forth voluminous evidence to prove that "there is considerably more than a dollar of fixed tangible property on the original-cost basis for every dollar of capitalization of holding company or of security." He contended that ownership of stock in companies in other states is not interstate commerce and does not subject the owner to federal legislation or investigation and that the issuance of bonds or stocks is not interstate commerce. Whether or not the sale and transportation of bonds and stocks constitutes interstate commerce has not been passed upon by the Supreme Court of the United States, Mr. Ransom said, but the Supreme Court has held that the issuance and sale of insurance is not interstate commerce. It also has been held that the use of the mails for business transactions does not constitute interstate commerce; but, even granting the power to investigate and to legislate as to the interstate sale of securities, Mr. Ransom made the point that it would not confer on Congress the power to investigate the production of the securities, which is a function reserved to the states.

## Massachusetts Commission Cuts Cambridge Rates

Petitions which have for some time been before the Massachusetts Department of Public Utilities asking a reduction in the rates of the Cambridge Electric Light Company were acted upon on Monday of this week, when the department made an order reducing the maximum rate of that company for domestic and commercial lighting from 8 cents to 5½ cents a kilowatt-hour, which, the department estimates, will bring to the customers a yearly saving of not more than $318,805 on the basis of 1926 consumption. No order was made affecting power and street-lighting rates. The company's request for a two-part rate based on floor area was not approved, nor was its petition for a service charge, though the department expressed willingness to sanction a service charge of 50 cents a month if the net maximum kilowatt-hour rate were made 4 cents.

## Detroit Edison Budget

*Thirty-Million-Dollar Expansion Program — Sixth 50,000-Kw. Unit at Trenton Channel and Fifth Turbine at Marysville Will Go Into Service*

THE Detroit Edison Company expects to add 50,000 kw. to its peak load this year and to connect twenty-five thousand new customers. To do this it will expend about $30,000,000, of which $8,862,700 will go for power plants, $5,283,100 for substations, $5,042,000 for transmission lines and the rest for new-business promotion, the heating department and miscellaneous equipment, construction and overhead.

The sixth and last 50,000-kw. turbine for the Trenton Channel plant (bringing its rating to 300,000 kw.) is to go into service next fall. Trenton Channel is the only power plant operated by the Detroit Edison Company in which the generating units are substantially identical, and this desirable feature makes a new departure in "spare parts" possible, namely, the purchase of a spare steam rotor, which may be used in any one of the six turbines at Trenton Channel or in one of the two turbines which are destined for Delray Plant No. 3. On the latter plant work will be continued this year, so that the turbines of 50,000 kw. each and four boilers will be ready for service late in 1929. The fifth turbine at the Marysville plant is a 30,000-kw. machine. It is due to go into service May 15. This makes three "thirties" and two "tens" at Marysville, giving a total rated capacity of 110,000 kw. The new 30,000-kw. turbine at Marysville, with the 50,000-kw. turbine at Trenton Channel, will add 80,000 kw. to generating capacity during 1928.

There are now in service three double-circuit, 120,000-volt steel-tower transmission lines connecting the Trenton Channel power plant with the Navarre and West Warren stepdown substations in Detroit. It is planned to add a fourth line during 1928. There is one double-circuit, 120,000-volt line from the Marysville power plant to the Northeast substation in Detroit, and this is to be supplemented by the completion of an additional single-circuit tower line. The interconnection with Consumers Power Company is almost complete and is to go into service early this year. The line is to operate at 132,000 volts. The interconnection will furnish a valuable reserve in case of breakdown and for handling peak loads.

Extensive revamping of oil-switch equipment is another of the items in the 1928 budget. Besides all this, four new substations will be built and additions made to existing stations.

## Norris Muscle Shoals Bill Reported to Senate

*Calls for Government Operation and Use of Revenue for Fertilizer Manufacture—Representatives Madden and Morin's Measures Before House Committee*

SENATOR NORRIS' resolution calling for federal operation of the government's Muscle Shoals power plant and distribution equitably among the states within transmission distance of energy generated there was reported favorably by the Senate committee on agriculture on Wednesday by a vote of eleven to four. The resolution authorizes the government to operate the plant for ten years and the Secretary of War would contract for the sale of energy to states, counties, municipalities, corporations, partnerships or individuals for terms not exceeding ten years beginning Jan. 1, 1929.

The net proceeds from the sale of energy would be set aside for developing, manufacturing and introducing improved fertilizers and fertilizer practices with a view to reducing the cost and increasing the efficiency and use of fertilizers on American soils. The bill would also authorize the Secretary of Agriculture, within the limits of appropriations made by Congress from such special fund or from the Treasury, to construct and operate fertilizer experimental or production plants anywhere in the United States, to contract with commercial producers for the production of fertilizers and to arrange with farm organizations for large-scale practical use of new forms of fertilizers. To enable the Secretary of Agriculture to carry out such program, the resolution carries an appropriation of $2,000,000. This measure will be opposed determinedly both on the floor of the Senate and in the House on the ground that it would be an entrance of the government into the power business.

In the House the military affairs committee has referred the administration's Muscle Shoals bill, introduced by Representative Madden of Illinois, to a sub-committee. Representatives of the American Cyanamid Company and the Air Nitrates Corporation were heard. The Madden bill, providing for the lease of the government's Muscle Shoals properties to the American Cyanamid Company, is still in controversy owing to the fact that President Bell of the company is not willing to make all of the concessions upon which the committee had insisted. The Madden bill has strong support in the House, but its lack of support in the Senate committee is thought to reflect a strong feeling in the Upper House against it.

Chairman Morin of Illinois issued a statement explaining the advantages as he saw them over previous measures of his compromise bill. Representative Morin's bill provides, he said, "for experimental operation on a commercial scale for the purposes of demonstration and experimental use of fertilizer products, looking to private development and operation of such an industry. Further, in view of the widespread insistence in the South that the power developed at Muscle Shoals not used in making fertilizer belongs to the public and should be equitably distributed, the proposed legislation provides for such distribution of the excess power, insuring, however, terms that will bring a reasonable return. Should it not be possible to do this, the proposition would be handled by the Secretary of War as at present and the power sold in the open market."

## Secretary Work Opposed to Pittman on State Rights

Secretary of the Interior Work, in a letter to Senator Johnson made public Jan. 28, takes issue with the contention, made in connection with the proposed construction of the Boulder Canyon Dam and indorsed in October last at the Denver Colorado River conference at the instance of Senator Pittman of Nevada, that individual states are owners of the waters of interstate or other streams flowing through their borders and may impose taxes for the use of such waters.

## Two New Steam Plants for Pacific Coast

*Great Western Power to Build 35,000-Kw. Plant at San Francisco—Los Angeles Gas & Electric Adding Unit of Same Size*

THE Great Western Power Company of California announces the acquisition of 35 acres of land in San Francisco as a site for a new steam plant. The initial capacity of this plant will be 35,000 kw., and it will be designed to burn oil as fuel. The plant will be equipped with 450-lb.-pressure boilers and will deliver energy at 60 cycles, 11,000 volts. It will double the company's present reserve steam supply for the San Francisco Bay region and will provide emergency service for the Great Western's extensive hydro-electric supply in this area. Work is to start at once, with completion expected next year. McClellan & Junkersfeld, New York, have been engaged to design and supervise construction of this station, which will cost approximately $4,000,000.

The Los Angeles Gas & Electric Corporation has begun the installation of a second generating unit of 35,000-kw. rating. The installation of this unit will double the present capacity of the Seal Beach plant, which will ultimately reach 210,000 kw. Three new 2,500-hp. boilers and 45,000 sq.ft. in condensers, together with the necessary pumps and switching apparatus, will be installed with the new generator, which is expected to be ready to operate about Aug. 1, 1928. When it is in operation the total present capacity of the two steam plants of Los Angeles Gas & Electric Corporation will be about 150,000 kw.

## Ottawa Government Views St. Lawrence

*International Aspect of River Development from Canadian Angle—Advisory Council Report—Opposition to Power Exportation Maintained*

AN IMPORTANT phase of the St. Lawrence waterway question dealt with by the Canadian National Advisory Council at a conference held in Ottawa in January concerned exportation of power. While the deliberations were conducted in camera, it is understood that one or two members of the council favored the idea of power export, on the ground that it would be a lucrative source of revenue for the Dominion. The majority of the council, however, were strongly opposed, and it is expected that the report, as finally drafted, will simply commend the stand taken last session of Parliament by the government, when Premier Mackenzie King, during a long discussion on the proposed Carillon department, assured the Parliament that there would be no export of power sanctioned by the Dominion government without the consent of the provinces affected.

Encouragement to private capital to develop the power on the national section of the river, virtually all of which is in the Province of Quebec, and the stipulation that those private concerns assist financially in the deepening of that section of the river, and recommendation that early steps be taken to open negotiations with the United States for a treaty governing joint deepening of the international section of the river between Lake Ontario and Cornwall, are understood to be other salient features of the report, which will be made public during the session of Parliament. that has begun.

A delegation from the Ontario Associated Boards of Trade and Chambers of Commerce recently waited upon the Dominion government and urged the improvement of the St. Lawrence waterways and development of the water powers by public ownership so far as Ontario is concerned. Two resolutions were presented. The first stated that in the opinion of the delegation the transference of any of the interests of the people of Ontario in the water powers of the St. Lawrence to the control of private or corporate interests should not be permitted. The second urged the government to proceed without unnecessary delay to make appropriate arrangements for the early construction of the enlarged St. Lawrence waterway and for the development of hydro-electric power between Lake Ontario and Montreal.

Premier King observed that the matter of "appropriate arrangements" connoted negotiations with the United States. "What," he asked, "is going to be the reaction on the public mind of Canada the minute the government begins to negotiate with the United States? Are the bodies that are now asking for the waterway going to back up the government?" Brig-Gen. C. M. Mitchell, who is a member of the Joint Engineering Board, replied that he thought so. No one could imagine for a moment that Canada could proceed without negotiations with the United States with regard to that part of the project which involved the two countries, he said. It was also felt, he added, that Canada ought not to export any power.

A Canadian newspaper report says that Montreal and Toronto financiers are prepared to install 13 miles of waterway in the St. Lawrence River between Lachine and Cornwall without cost to the government and develop eventually 2,000,000 hp. at this point, beginning with 300,000 hp. for which chemical and metallurgical works are ready to contract. According to the paper, the whole head of 80 ft. will be used and three sites developed, with power houses on the south shore opposite Lachine, which is virtually a suburb of Montreal. The syndicate behind the plan is said to have control of the Beauharnois Light, Heat & Power Company, of which R. O. Sweezy is president, and already to possess power rights on the St. Lawrence.

## State Politics and Utility Companies

### Massachusetts Votes Down Bill to Abolish Commission Jurisdiction —Gubernatorial Candidates in Ohio and Indiana Criticise State Regulation—Movements Elsewhere

A MOTION in the Massachusetts Legislature by Representative Twohig of Boston in favor of transferring to that body the powers of the Department of Public Utilities in connection with the supervision of public service corporations was defeated by 67 to 37. Several members of the Legislature attacked both the utility companies and the commission.

With the spring primaries in Indiana impending, the utility companies in that state are beginning to take an interest in the views of candidates, particularly those who are in the field for Governor and the Legislature. The primary interest of the utilities, naturally, is concerning the retention or abolition of the Indiana Public Service Commission and laws directly affecting taxation. Two well-known politicians are in the field for nomination as Governor both of whom are opposed to the present utility laws. Frank Baker, an Indianapolis attorney, who is a candidate on the Democratic ticket, makes the statement that he favors the abolition of the Public Service Commission. Alvah J. Rucker, recently corporation counsel for Indianapolis, a candidate on the Republican ticket, believes the utility regulation laws should be so changed that the municipalities will have more to say than at present. While corporation counsel he charged that the utility interests of Indiana had donated thousands of dollars to the campaign fund of the present Governor in order to influence his commission appointments.

#### Opposed Viewpoints in Ohio

Attorney-General Edward C. Turner of Ohio, a critic of public utilities, has announced his candidacy for the office of Governor, with the utility question as his chief issue. Mr. Turner has made a number of addresses in recent months in which he denounced Ohio public utilities as dealing unfairly with the public and uniting with other interests for the purpose of influencing the Legislature. He has also criticised the Ohio Public Utility Commission, charging that it is a poor safeguard.

"Rate making," Mr. Turner says, "is primarily an economic, not a political problem, and that is the crux of the whole matter. Our public utility commissioners are composed almost exclusively of men appointed for political, or sometimes personal, reasons. There are not many real economists among them. They may desire to do the right thing, but how can they answer the arguments of the able and resourceful lawyers whom the great corporations seeking franchises or increased rates can hire? What do they know about basic costs of production of public utility products or service or fair valuations of great corporation properties?" Mr. Turner maintains that service to be rendered and rates to be charged by a public utility corporation should be made the subject of a definite contract with provision for price changes in accordance with fluctuations in tax and interest rates and cost of labor and material. At present, he says, there is an overemphasis on reproduction cost as a rate base.

Governor Donahey, on the other hand, says that in Ohio regulation of utilities is a success. "We do not need any aid in this respect from the federal government," he declares, in commenting on the proposed Senatorial investigation of utility companies. "The sale of utility securities, like that of any other securities, is under state control. But, regardless of financial operations in utility securities, consumers' interests are protected, for the companies' earnings are restricted to a fair return on the value of the property used and useful for serving the public. Ohio stands firmly on the principle of state's rights and will resent any movement on the part of Congress to centralize the regulation of public utilities by the federal government."

William Tudor Gardiner, candidate for the Republican nomination for Governor of Maine, advocates leaving the question of power exportation to the people by means of a referendum vote. If there is a surplus of power after the demand for electrical energy in Maine is satisfied, Mr. Gardiner thinks that the power should be sold in any outside market, subject to recall when needed. The Maine Public Service Commission could be called upon to determine what is surplus power.

A joint resolution asking that the International Joint Commission refuse permission for the construction of dams on the Minnesota-Ontario boundary has been introduced in the Wisconsin State Senate by Walter S. Goodland of Racine. The resolution asks that the permission be refused because the proposed dams would destroy the beauty and attractiveness of the boundary lakes.

The question of public ownership and operation of hydro-electric utilities will be before the voters of Oregon again at the next general election if the plans of the Co-operative Berry Growers' Association materialize. Despite the fact that the Oregon electorate declined to sanction a similar proposal by a vote of 147,092 to 35,314, the members of the fruit organization are seeking to arouse interest in an initiative petition which will again place the question before the people. Advocates of the plan propose to frame an amendment which will commit the state to a policy of developing local water-power resources and selling energy to the public at 10 per cent above the actual cost of production.

## Reduced Rate Schedules and New Methods in Indiana

Twenty-five cities and towns in Indiana served by the Interstate Public Service Company are affected by a new optional electric rate schedule on all domestic service, including lighting, cooking, heating, refrigeration, water pumps and oil-burning appliances, which has been filed with the Indiana Public Service Commission. The new schedules provide for lower rates for domestic use in cases where additional equipment for the home, such as cooking and refrigeration, is used in connection with domestic lighting. Cities and towns affected by the new rates include Bedford, French Lick and West Baden.

Reductions in electric rates at Michigan City and six smaller places are provided in new optional rate schedules submitted by the Northern Indiana Public Service Company and approved by the commission. Rates included in the new schedule in most places range from 7 cents net down to 2½ cents per kilowatt-hour, with a meter charge of $1. A 4-cent rate for cooking and refrigeration is included.

Continuance until April or May of the present Huntington rate schedules has been asked by the Northern Indiana Power Company. The Northern Indiana Power Company, a subsidiary of the Central Indiana Power Company, is one of several Insull electric utilities in Indiana experimenting with rate charges based on the number of electrically connected rooms in a house. Some consumers at Huntington are seeking to stop the experiments, and the commission has set Jan. 19 as the date of the hearing.

## Permits Asked for Chattahoochee and Western Rivers

Application to the Federal Power Commission has been made by B. H. Hardaway, J. Smith Lanier and Frederick H. McDonald for a preliminary permit for a power project on the Chattahoochee River, in Chambers County, Ala., and Troup and Heard Counties, Ga., near West Point, Ga. The applicants contemplate construction of one or more dams across the Chattahoochee at the Adamson or Wehadke dam sites, with a head of about 70 ft. and an initial installation of 12,000 hp. to 24,000 hp. of electrical machinery. The developed power will be utilized for public utility purposes. The applicants state that such a development will also aid flood control and afford transportation facilities by water to the town of Franklin, Ga., now 14 miles from railroad connections.

The Mount Baker Development Company has applied for a license for a partly constructed project on Bagley Creek, Wash., within the Mount Baker National Forest, 95 miles from Seattle. A concrete-arch dam 16 ft. high and 64 ft. long, creating a reservoir of 9½ acres in area, provides water for operation of 132 hp. in installed capacity.

The city of Milton, Ore., has applied to the commission for a preliminary permit covering a project on the South Fork of the Walla Walla River, in Umatilla County, Ore. It is planned to construct a power house just above the intake of the present plant and divert water to it from four miles upstream. This diversion will eventually be extended to the tailrace of the power house of the Pacific Power & Light Company. Another power house is to be constructed above the intake of the Pacific Power & Light power house which will furnish water for a proposed reservoir on the South Fork of the Walla Walla River. The power capacity of the first unit will be 1,150 hp.

L. B. Rouse of Pine Grove, Calif., has applied for a license covering a project on the Middle Fork of the Mokelumne River, Calif. This application is in conflict with a larger project of J. W. Preston, Jr.

## Citizens to Study Great Falls of Potomac Plans

Appointment of a committee to study the relative scenic and utilitarian values of the Great Falls and Gorge of the Potomac River, use of which for hydro-electric projects is opposed by the National Capital Park and Planning Commission and various civic organizations of the District of Columbia, is announced by Major Brehon Somervell, United States Army engineer, to whom the applications of Stineman & Quick, Baltimore; the Potomac River Corporation and the South Branch Power Company for permits to develop this section of the Potomac were referred by the Federal Power Commission.

The committee will consist of Capt. H. O. Oram, Corps of Engineers; Charles W. Eliot 3d, city planner, National Capital Park and Planning Commission; C. A. Peters, engineer, office of Public Buildings and Public Parks; Dr. A. Eugene Baker, member Westchester Park Commission, New York, and Addison Flurnoy, Washington, landscape architect.

## Artistic Lighting Association at Cleveland

The first day of the annual meeting and convention of the Artistic Lighting Equipment Association and a meeting of the Illuminating Glassware Guild at the Hotel Winton, Cleveland, Jan. 25 to 28, saw the registration of two hundred manufacturers and dealers. Of particular interest at this meeting was the proposed sales promotion and refixturing campaign, the details of which were outlined by G. P. Rogers on Friday morning. This campaign contemplates the adoption of a slogan and emblem by all members of the Artistic Lighting Equipment Association. This is to be popularized by means of an emblem tag attached to fixtures and is to be advertised locally by dealers and through the trade press by manufacturers and jobbers. A comprehensive plan of direct-by-mail folders, newspaper advertisements and publicity on adequate lighting is to be made a part of the campaign. General business sessions of the lamp and lighting equipment manufacturers were held on Thursday and Friday, with the annual dinner dance on Thursday evening.

## Northwest Inspectors Favor International Association

A determination to continue to strive for the formation of an international association and to continue to co-operate with the electrical committee of the National Fire Protection Association, through its field secretary, as a means of exerting the co-ordinated effort necessary to an adequate revision of the National Electrical Code was the keynote of the third annual convention of the Northwest Association of Electrical Inspectors, which opened on Jan. 26 at Seattle. Eighty members registered.

The efforts to affiliate the sectional inspectors' associations into a nation-wide group were described in a progress report by F. D. Weber, secretary of the Northwest association and its representative in the national conference. In his annual message President H. S. Jenkins, chief electrical inspector for Bellingham, Wash., stressed the necessity of attaining safety through intelligent code making and administration without raising the standards to a point where the cost would act as a deterrent.

Speakers at the sessions included C. R. Welborn, Underwriters' Laboratories, Chicago; W. A. Groce, Olympia, and William Meacham, a Seattle contractor, who insisted that local regulations should be in addition to and not in modification of the national code.

# Electrification, Welding and X-Ray Uses

*These, with an Address by C. F. Hirshfeld on Economic Aspects of Engineering Advance, Are Features of the Michigan Engineering Conference*

At the third annual conference of Michigan technical men, held in Detroit, Jan. 27 and 28, several addresses of special interest to electrical engineers were made. W. N. Vandersluis, electrical engineer for the Illinois Central Railroad, stated that during the first full year of electric operation his road recorded a 20 per cent increase in passenger traffic over the previous year of steam operation. The constant improvement in economy in the generation of electric power by central stations makes electrification of steam railroads increasingly attractive, he asserted; further, the business of the railroad is transportation, and power generation may well be left to the power companies where practicable. One of the advantages of electrification, he pointed out, is the elimination of fuel and water stations and the release of large numbers of coal cars for commercial service. The Chicago, Milwaukee & St. Paul found that 12 per cent of the power output of its substations is returned with regenerative braking. However, Mr. Vandersluis concluded, it looks as though it would be a long time before a uniform electrical system for railroad electrification is evolved in the United States.

According to William Spraragen, secretary American Welding Society, who was another of the speakers, there is great need for recognition of the fact that best results are never obtained by welding a part or a structure designed to be riveted. There is an enormous field for the application of automatic electric welding, which is not only a great labor saver but produces a more uniform product by the accurate control of variables. Electric spot welding has come into wide use in automobile body fabrication.

Prof. George L. Clark of the University of Illinois showed that the X-ray is an engineering tool that has been put to use in inspecting metal castings for hidden flaws, in testing welds for soundness, in the inspection of insulated wire, and in locating wires and pipes hidden behind walls. The hysteresis characteristic of silicon steels may be indicated with the X-ray.

The economic consequences of the revolutionary improvements that research and engineering have made in industry were discussed by C. F. Hirshfeld, chief of research of the Detroit Edison Company. Had it been looked forward to years ago, a large increase in production per unit of time, labor and investment would have seemed to herald disaster to the law of supply and demand. What actually happened was that the consumer, who is also the producer, received increases in real wages, so that he is enabled to buy more, and thus the demand for manufactured goods has kept pace with the increase in production. It is generally said, Mr. Hirshfeld remarked, that American prosperity follows from the large amounts of mechanical and electrical power placed in the hands of our workers. It is an error, however, not to include the effects of improved organization, improved treatment of wage earners, increased efficiency of executive forces and increased output per unit of invested and of working capital.

---

# Serving Luncheon on Top of a Power-Plant Stack

Something new in the way of pleasing customers was recently thought of by the Jordan (Minn.) Electric Light & Heating Company. One hundred and twenty citizens of that place made an ascent to the top of the smokestack of the company's plant, which is 108 ft. high, 4 ft. in diameter and built of brick and concrete. Of these climbers seventeen were women. About fifty persons were served with luncheon on top of the stack, six at a time, according to S. L. Sly, manager of the plant. The luncheon, which was cooked electrically, can be seen in the picture as it approaches the reach of the guests.

The Jordan plant furnishes electric light and power service to the city and district steam heat to 64 buildings, so that the stack is the only one in the place, which in consequence boasts a sky almost clear.

---

# Build 946 Miles of Line in North Dakota in 1927

North Dakota's seven major electric light and power companies had 2,846 miles of transmission lines either constructed or approved on Dec. 1, 1927, according to a report just made public by the North Dakota Board of Railroad Commissioners. The seven companies are the Otter Tail Power, the Northern States Power, the Montana-Dakota Power, the Hughes Electric, the Northern Power & Light, the Northern Utilities Corporation and the Interstate Power Company. During 1927 four of these companies constructed 946 miles of transmission lines. The policy of merging small community units, thus adding a total of 53 towns to their service, was continued by the four companies.

The report shows that the total mileage of the Otter Tail Power Company's transmission lines in North Dakota, either constructed or approved, is 1,562 miles; of the Northern States Power Company, 110 miles of the Montana-Dakota Power Company, 477 miles; of the Hughes Electric Company, 307 miles; of the Northern Power & Light Company, 276 miles; of the Northern Utilities Corporation, 82 miles, and of the Interstate Power 25 miles. During 1927 the Montana-Dakota Power added 53 miles of 13,200-volt lines, the Northern Power & Light 157 miles at 22,000 volts, the Hughes Electric 46.5 miles at 12,300 volts, the Otter Tail Power 410 miles at 38,100 volts, 115 miles at 6,600 volts, and 165 miles at 13,200 volts. Thirty towns were added to the Otter Tail Power Company system, eleven to the Montana-Dakota Power system, seven to the Hughes Electric system, and five to the Northern Power & Light system.

# Conowingo Dam Closed

*Formation of Nine-Thousand-Acre Lake Begins as Ancient Village Disappears from Maryland Map—Power to Be Transmitted in Spring*

Many spectators gathered near the deserted site of the 150-year-old village of Conowingo, Md., on Wednesday, Jan. 18, to watch the water gradually accumulate in the 9,000-acre reservoir which became a fact when the last eight gates of the great dam were closed early that morning. The new lake will extend 13 miles up the river into Pennsylvania. Its depth will vary from 100 ft. at the dam down to 40 ft.

Work on the Philadelphia Electric Company's great hydro-electric plant began in March, 1926. From that time until a few weeks ago from 2,000 to 3,500 men were employed on the task. With favorable conditions and organizations, the fifty-two-million-dollar project has been finished several months ahead of time. The construction required the excavation of 400,000 cu.yd. of rock. More than 750,000 cu.yd. of concrete were required on the work.

The first three of the seven generators are to be installed at once, and it may be possible to transmit power to Philadelphia in three months' time. In the fall, when the seven generators are completed, Conowingo will be second only to Niagara Falls among the hydro-electric plants of the country. It will then have a capacity of 378,000 hp., outranking the existing installation at Muscle Shoals and far surpassing such plants as those at Holtwood and Keokuk. The eventual capacity of Conowingo, with eleven generators, will be 594,000 hp.

# Purchases and Mergers

*Iowa Public Service Company, Along with Sioux City Gas & Electric, Goes to American Electric Power—Bankers Buy Central West Public Service—Many Other Transactions*

PURCHASE by the Iowa Public Service Company of the Sioux City Gas & Electric Company from the United Gas Improvement Company of Philadelphia is reported. This sale, which is connected with the U.G.I.-American Electric Power transaction recorded last week (page 220), includes the new Big Sioux power plant in North Riverside, which cost $3,500,000 and upon which a million-dollar addition is under way, and several hundred miles of high-tension transmission lines in northwest Iowa, serving nearly a hundred towns and cities in the Sioux City district, as well as the Sioux City Service Company. The deal is reported to have involved nearly $10,000,000. The United Gas Improvement Company had been interested in the Sioux City utilities since 1889. C. I. Crippen and H. A. Clarke, vice-presidents of the American Electric Power Corporation, and Don Stearns, president of the Iowa Public Service Company, announce that the actual transfer of properties will probably be accomplished in 30 days. W. J. Bertke, president of the Sioux City Gas & Electric Company, said that the American Electric Power Corporation will acquire the interests of the United Gas Improvement Company in the Iowa Public Service Company in exchange for the holdings of the American Electric Power Corporation in the Delaware Electric Power Company. This arrangement, he explained, had been promoted by the desire of the United Gas Improvement Company to concentrate its holdings in the East and by the desire of the American Electric Power Corporation to acquire a strong utility company in the Middle West. General offices of the Iowa Public Service will be continued in Fort Dodge, Iowa, and Don Stearns will continue as president.

Announcement is made of the purchase by A. B. Leach & Company and I. M. Porter & Company of New York and Chicago of the stock holdings of Walter M. Albertson, president, and George M. Kaltwelt, vice-president, in the Central West Public Service Company and subsidiaries for a consideration of $3,000,000. The Central West Company serves 147 communities in Nebraska, Iowa, North and South Dakota and Minnesota, with headquarters at Omaha.

Negotiations have just been concluded by which the New England Public Service Company, as already forecast, acquires the Utilities Company of Meredith, N. H. The purchase, which follows that of the Franklin (N. H.) Light & Power Company, may, it is rumored, be followed by acquisition of additional rights in and around Plymouth, N. H., including the plant of the Parker-Young Company. The Utilities Company has a dam on the Pemigewasset River near Bristol, N. H., and supplies power and light to a population of approximately 70,000.

Arthur S. Dewing of Boston has obtained control of the Goodrich Falls (N. H.) Electric Light & Power Company. He now controls also, it is understood, the Meredith Electric Company, the Baker River Light & Power Company, the Hill Light & Power Company, the East Andover Light & Power Company and the Alton Electric Light & Power Company, all in New Hampshire. Water rights are included.

Permission to purchase the electric distribution systems at Hannaford and Cooperstown has been given by the North Dakota Railroad Board to the Northern Light & Power Company. Both properties now are owned by the Electric Construction Company. The Otter Tail Power Company has received permission to buy the electric properties at Sanish and Van Hook from the General Service Company and the Van Hook Light & Power Company respectively and also to purchase the electric property at Ryder from the Ryder Electric Company.

Approval by the North Dakota Railroad Board has been given the transaction whereby the Northern Utilities Corporation sold to the Dakota Public Service Company, controlled by the same interests, the electric properties at Buffalo, Gackle, Medina, Streeter, Starkweather and Tower City. The commission has also authorized the purchase of electric properties at Bowman and Reeder by the Dakota Public Service Company. Both of these properties were owned by the Bowman Electric Company. The former company has bought the Hettinger Electric Light & Power Company and the Alpena (S. D.) plant.

Announcement has been made that Baker, Young & Company have acquired the control of the Page Power and Massanutten Power companies, Luray, Va. The Page Power Company recently completed a hydro-electric dam on the Shenandoah River. The Massanutten Power Company, a subsidiary of the Page Power, was the result of a purchase of municipal plants.

Merger of the Saranac River Power Corporation and the Saranac Utilities, Inc., just chartered, is in prospect, according to T. Harvey Ferris of Utica, N. Y. If the merger is permitted, the company will own 8,000 hp., of which 7,000 hp. is developed.

By a vote of 244 to 168 the village of Sargent, Neb., has rejected a proposal to sell the municipally owned plant to the Nebraska Electric Power Company.

The Northwestern Utilities Corporation of Minneapolis has completed the purchase of the Mapleton (Minn.) Electric Company.

Jolley, Iowa, will sell its municipal electric system to the Iowa Public Service Company if the voters approve an agreement entered into by the Town Council.

Sale of the municipally owned electric system at Bagley, Iowa, to the Iowa Railway & Light Corporation has been authorized at a special election.

The Adrian, Burnside, Colusa & Ferris Light & Power Company of Ferris, Ill., has applied to the Illinois Commerce Commission for permission to sell its property to the Central Illinois Public Service Company.

The Illinois Public Utility Company has been authorized to purchase the Heyworth Electric Light & Power Company, serving Heyworth, Randolph and Wapella, for $55,000 and to construct and operate a 13,000-volt transmission line between these places.

Elsberry, Mo., has sold its municipal electric plant to the Missouri Edison Company for $55,000.

The Federal Public Utilities Company of Chicago has sold the Waynesboro (Miss.) ice and light plant to the Central States Power & Light Company, with headquarters in Davenport, Iowa. The plant was purchased by the Chicago concern several months ago for about $72,000. Included in the same deal were the light and power plants in four other Mississippi towns—Lucedale, Leaksville, New Augusta and Brandon—and in Citronelle, Ala.

Purchase of the Santa Cruz County Utilities of Boulder Creek, Cal., and the Capitola Company of Capitola, Cal., by the Public Utilities California Corporation, a Foshay organization, has been approved by the California Railroad Commission. The newly acquired properties supply electric power and water to a territory about 14 miles from Santa Cruz.

What seem to be well-authenticated reports from Phoenix, Ariz., indicate that the Arizona Power Company, an independent utility, may soon become a subsidiary of one of several large holding companies interested in Arizona utility properties.

Sale of the Gallup (N. M.) Electric Company to the International Utilities Company of New York is announced. A previous deal with the Texas-Louisiana Power Company fell through.

The merger of the Kentucky Power Company with the United Public Service Company of Chicago, noted last week, has led to speculation in Cincinnati as to the possibility of future competition between Kentucky and Ohio utilities. The Kentucky company supplies power to Augusta and 37 other places in Kentucky and has wires covering fourteen counties and reaching as far west as California, Ky., about 25 miles from Cincinnati.

Confusion caused by newspaper announcements is cleared up by an official statement from George N. Tidd, president of the American Gas & Electric Company, that, while retaining the electric light and power business in Roanoke and Lynchburg, Va., and the Lynchburg gas plant, which have for some time been operated by the Appalachian Electric Power Company, the American Gas & Electric has sold the Roanoke Railway & Electric Company, the Roanoke Traction & Light Company and the Lynchburg Traction & Light Company, operating railway and bus lines. The new owner is the Central Public Service Company, Chicago, which also recently purchased the Rockford Electric Company and various railway and bus lines from the American Gas & Electric Company.

Official announcement is made at Montreal of a long-looked-for absorption of the St. Maurice Power by the Shawinigan Water & Power Company, the parent company. The subsidiary will be merged into the Shawinigan on a basis of two shares of Shawinigan for one share of St. Maurice, with the alternative of $175 per share in cash offered to St. Maurice stockholders.

Making its first entry into the northern Canadian field, the Mid-West Utilities, Ltd., a subsidiary of the International Utilities Corporation, has purchased the municipal electric plant at Grande Prairie, Alberta, for $13,500.

The International Power & Paper Company of Newfoundland, Ltd., a subsidiary of the International Paper Company, has acquired the property and assets of the Newfoundland Power & Paper Company, Ltd. The properties include a hydro-electric plant generating 98,000 continuous horsepower. The controlling interest in the Newfoundland Power & Paper Company was owned by English interests.

# Jersey City Is Site of New Switching Station

*Public Service Production Company Builds Third in Series of Such Plants, Hudson Following Trenton and Athenia—Built in Seven Months*

THE third of a series of high-voltage distributing centers for electrical energy was connected to the lines of the Public Service Electric & Gas Company at Jersey City, N. J., on Jan. 28. This station, known as the Hudson switching station, is supplied with power at 132 kv. from a two-circuit tower line connecting near by to the 132-kv. link between the Marion generating station and the Kearny and Essex stations.
